" Willsoni.
" Duke of Wellington.

Verbenas, 60 new varieties of 1854, of the first raisers.

☞ A quantity of Corræa and Pimelea Stocks Wanted.

Sudbury, Suffolk.

TO THE TRADE.

JOHN HARRISON begs to offer to the Trade the undermentioned plants, of which he has a large stock.

Rose Manetti, strong cutting	25s.	0d.	p. 1000
Raspberry, Northumberland Fillbasket, the best variety in cultivation, 20s. per 100 ...	160	0	"
Do. Fastolff, 8s. per 100, or	60	0	"
Do. Wilsher Red Globe, ...	10	0	per 100
Do. Magnum Bonum	10	0	"
Rhubarb, Victoria, strong	25	0	"
Do. Royal Albert, do.	30	0	"
Currants, Victoria, 1 year old...	6	0	"
Do. do. 2 years old, strong ...	12	0	"
Do. Black Naples, 1 year	6	0	"
Do. do. do. 2 years	10	0	"
Do, do. Bang-up, extra fine	12	0	"
Arbor-Vitæ, 1½ to 2 feet	15	0	"
Juniper, Swedish, 1½ feet	25	0	"
Cupressus Funebris, 1½ feet	100	0	"
Delphinium Barlowi, strong	40	0	"

Roses of all the best varieties in cultivation, of which J. H. has a stock of many thousands, one year established in pots, and fit for immediate forcing.—Nursery, Darlington, Feb. 24.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" Pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

GOLDEN DROP GREEN-FLESHED MELON.

J. CHARTRES AND Co. have a limited quantity of Seed of this splendid variety, which they can with confidence recommend; it is of moderate size, oval shape, and beautiful gold colour. Six seeds, 1s.

J. C. and Co. beg further to state that their unrivalled Stock of Seeds is now arranged, of which a Descriptive and Priced Catalogue may be had on application.

York Nursery, Hanger Lane, Stamford Hill; and 74, King William Street, City, London.—Feb. 24.

NOW READY.

WILLIAM AND GEORGE DAVISON can supply complete collections of KITCHEN GARDEN SEEDS, to suit the various sized Gardens, at the following prices:—

No. 1 Collection ...	£3 0 0	No. 3 Collection ...	£1 2 6
No. 2 " ...	1 16 0	No. 4 " ...	0 12 6

FLOWER SEEDS: 50 packets, including the best hardy, half hardy, and tender Annuals and Biennials, with printed instructions, 10s 6d.; 25 ditto ditto, 6s.; 12 ditto ditto, 3s.

GRASS SEEDS: Fine Lawn Grass Seed 1s. per lb.; Grass Seeds for laying down permanent pasture mixed to suit any soil, 30s. per acre. Every variety of agricultural Seeds of the finest quality. Priced Catalogues may be had on application to W. & G. DAVISON, Seed Warehouse, St. Peter's Street, Hereford.

NOW READY.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready, and should be ordered forthwith, by which a full supply of every kind of Vegetable Seed required during the whole year will be secured (including the best sorts yet introduced), and at a very small cost, viz.:—*

No. 1 Collection ...	£3 0 0	No. 3 Collection ...	£1 5 0
No. 2 do. ...	2 0 0	No. 4 do. ...	0 15 0

The quantities in each collection being apportioned to the size of the garden, INSTRUCTIONS ON CULTIVATION will be enclosed with Nos. 1, 2, and 3. To secure the best sorts, orders should be given immediately, addressed

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

GRASS SEEDS, SEPARATE OR MIXED.—*Gentlemen intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.* Price 24s. to 32s. per acre for Permanent Pasture.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 24, 1855.

IN adverting last week to the SEVERITY OF THE WEATHER, it was remarked that the minimum thermometer on the 10th inst. was only 1° above zero, and that on the night of the 13th it indicated as low as that point, or 32° FAHR. below freezing. Since then the temperature has been nearly as low on two successive nights; on the 17th it was only 2°, and on the 18th but 3° above zero. The following are the minimum temperatures from the 12th to the 22d inclusive:—

1855, Feb.	12th	13th	14th	15th	16th	17th	18th	19th	20th	21st	22d
Min. tem.	23°	0°	17°	10°	19°	2°	3°	20°	8°	10°	23°
Radiator	20	−6	13	5	17	−6	−3	15	2	5	20

From the above it will be observed that when the ordinary thermometer indicated zero on the 13th, a thermometer in the focus of a polished metallic basin, and thus cut off from radiation of heat from the earth, and exposed to the actual temperature of the air, showed 6° below zero; and it was equally low on the night of the 17th, when the ordinary minimum thermometer stood at 2° above zero.

The whole of the last four weeks has been unusually severe;—indeed, since the 9th of January the temperature of the nights has been for the most part considerably below freezing. The effects on vegetation of this long-continued and intense cold remain to be seen. In the meantime the following table may be interesting, affording as it does an analysis of the temperature of the 31 days, from the 19th of January last to the 18th of February inclusive, comparatively with that of the same number of consecutive days in other very cold periods that have occurred since 1800.

Table of the mean maximum, mean minimum, mean, and extreme lowest temperature of the coldest periods since the commencement of the present century.

YEARS.	Mean Maximum	Mean Minimum.	Mean.	Extreme lowest.
1855 Jan. 19 to Feb. 18...	33.77	18.19	26.33	Feb. 13 ... 0
1845 Jan. 26 to Feb. 25...	40.93	24.51	32.72	Feb. 11 — 3
1838 Jan. 7 to Feb. 6 ...	31.10	21.29	26.19	Jan. 19 — 4½
1822, 1823 Dec. 26 to Jan. 25...	33.61	22.64	28.12	Jan. 19 ... 4
1819, 1820 Dec. 23 to Jan. 22...	33.71	19.45	26.58	Jan. 14 ... 0
1816 Jan. 29 to Feb. 27...	38.80	25.13	31.96	Feb. 9 — 5
1813, 1814 Dec. 27 to Jan. 26...	31.26	19.84	25.55	Jan. 9 & 22 8

From this it appears that the mean minimum of the above period, 31 days, of the present year is lower than that of any other remarkably cold period, comprising the same number of days, in the present century; and that its mean of day and night temperatures is only exceeded by those of 1838 and 1813-14; whilst its lowest extreme is not so cold as those which occurred in 1845, 1838, and 1816. In general severity, 1813-14 exceeded all the others, but its extreme lowest point of cold appears, according to the tables in "Howard's Climate of

London," to have only reached within 8° of zero, or not so low by 12½° as was experienced on the 19th of January, 1838, which proved so destructive to vegetation. Of the effects of the cold of the former period on plants there is probably no good record, but it is certain that many things which then survived were killed in 1838. The frost which set in about the 27th of December, 1813, continued with scarcely any interruption till the 7th of February, 1814. A fair was held on the Thames between London and Blackfriars bridges, and the whole space was covered with people; but on the 11th of February the river had been again navigable, for on that day Howard states, "The busy oar is now plied with its wonted alacrity, and the sons of commerce are pursuing their avocations with redoubled energy."

The present severe frost set in when the ground was remarkably dry for the period of the season. The springs were probably never known to be so low in winter. In some cases where wells have afforded a supply for many years, the pipes have had to be lengthened to reach the water. In an open well at Chiswick the water is now 6 feet lower than it was in 1852. The average annual amount of rain near London is 24 inches; but last year the depth of rain scarcely amounted to 19 inches. In February, March, and April, 1854, the total depth of rain was only 1½ inch, instead of the average of 6 inches. In September there was little more than half an inch. This circumstance, together with a higher temperature than usual in September during the day, contributed greatly to render the summer growth of trees and shrubs riper and firmer than would have otherwise been the case; and hence there is a probability that the present frost will have less effect than under opposite circumstances. The dryness of the ground must likewise be favourable for vegetation.

The temperature of the fortnight preceding this period of severe frost was considerably higher than usual. This is frequently the case before unusually cold periods, but rarely unaccompanied with so little rain as in the present instance; for scarcely any fell up to the middle of January of the present year; and the total amount was only one-tenth of an inch during the last month.

Notwithstanding the perils and hardships which our brave countrymen have endured in the Crimea, the arts and sciences have not been neglected, as the numerous admirable sketches from the pencils of our military men daily testify; and we are indebted to the zeal and kindness of an officer (Capt. George Elliot, R.M.) for some very remarkable productions.

We have already published several essays upon various Oak-galls, some of which are not uncommon in this country, whilst others have been transmitted from the south of Europe.

We may here remind our readers of a very singular feature regarding these vegetable excrescences, namely, that they are produced by four distinct orders of insects—the Diptera, Omoptera, Lepidoptera, and Hymenoptera. These last produce the galls of commerce as well as other kinds, which vary most singularly in form, notwithstanding the perfect flies (Cynipides) are often very similar.

It is now well known that the female Cynips when it punctures the plant to deposit its egg introduces with it some virulent or poisonous fluid which acts upon the sap, and by deranging the circulation causes the bud, leaf, or stem to produce spongy or woody excrescences. These are often modifications of the leaf-bud or flower-bud, or enlargements of the nervures or tissues of the developed leaves; and thus one sees the flowers of the Oak transformed into globules like bunches of Currants, the buds into shoots resembling Hops, and the cups of the acorns assuming the most grotesque forms. The leaves are ornamented with a variety of galls, some as round and large as marbles, others not bigger than Peas, whilst the undersides are frequently spangled with rosy caps and turbans. The Oak Apples, our acquaintances from childhood, are spongy; there are woolly, tasselled, and prickly masses of a like nature, the creations of similar species of gall-flies, and now and then we find on the bark clusters of objects like little multivalve shells called Barnacles.

Hitherto it has not been possible to account for these variations of structure in the galls, nor is this the place to discuss so difficult a subject. We shall prefer giving figures of the different galls from the East, which seems to be particularly rich in these extraordinary productions of Oak-trees.

1. The gall now figured is similar in character to one which we once found in the park and plantations, called the Reali Cascine, near Florence, and was published in this Journal, Vol. IV., p. 212, under the name of "the Chestnut-fruited Oak-gall," from its resemblance to the fruit of the Sweet Chestnut. The fly produced from the Florence gall is similar to many others of the genus Cynips, but we are at present unacquainted with that which causes the excrescenses, one of which is represented in the cut.

1. Chestnut-fruited Oak-gall, *var.*

2. This oriental Gall so greatly resembles some of the Sea-urchins (Echini), which inhabit our rocky coasts, that we would distinguish it by the name of *Echiniformis*. It is, however, not improbable that it may be only a modification of one we have already published from the same country,

2. Echiniform Gall.

and it is questionable whether they may not be formed by the same species of fly of which we know nothing at present.

3. This is another remarkable variety of Galls from Capt. Elliot, and being exceedingly like the clusters of Barnacles (Balanus) attached to oyster shells and rocks below high-water mark, we would call it *Balaniformis*. Similar groups of Galls have been

3. Balaniform Gall.

found in England by a lady and also by Dr. Badham, but the individuals composing the bundles are much smaller than those from the East. They are all found on the bark.

It must be observed that the flies which are the authors of these excrescences have not yet been discovered, but it may be fairly assumed from those we do know, that they are related to the Cynips Quercus-ramuli of Linnæus and its congeners.

4. *Mala Sodomea* (the Bitter Apples of the Dead Sea).—This remarkable gall, called also the *Malum insanum*, appears to be widely distributed over the East—in Syria, the Crimea, and probably wherever certain dwarf Oaks will grow.

These galls are as large as small Figs, and somewhat the same shape, with tubercles scattered over the shining surface, which is of a greenish colour when young, and spongy inside, but becomes of a rich purple colour when matured, at which time the interior is reduced to a snuff-coloured light substance, which crumbles into dust when crushed, and is bitter to the taste.

> "The Dead Sea fruits that tempt the eye
> But turn to ashes on the lips,"

attracted the notice of Strabo, Josephus, and Tacitus, and are apparently alluded to in the Book of Wisdom: "the plants bearing fruit that never come to ripeness." By more recent writers, the origin of these galls has been attributed to various causes, all of them erroneous, until it was suggested by Mr. Conder that they were possibly the work of some insect, and this was verified by specimens collected on mountains east of the Dead Sea by the Hon. Robert Curzon, and also by others sent home by Walter Elliott, Esq., from the Troad.

The attachment of these galls is very peculiar; they seem to embrace the twig at its extremity and not to arise out of it, being more like the nest of an insect than a gall in this particular; and large as the galls are, they seem to be destined for the habitation of one maggot only, for they contain but one cell in the centre, from which the perfect Cynips is hatched, and escapes through a gallery or tube, and perforates the outer skin when it becomes a fly, so that the old galls have a hole on one side the size of a shot.

4. Bitter Apple.

The fly from the Bitter Apple is known and figured,* and is similar to that produced from the galls of commerce, Cynips Quercus-infectoria. An ichneumon fly has also been hatched from the galls, which is described as being a parasite of the Cynips.

Mr. Curzon informed Mr. Lambert, that "the tree that produces them (the galls) grows in abundance on the mountains in the neighbourhood of the Dead Sea, and is about the size of our Apple trees." They were produced upon the Quercus infectoria, but the specimens, one of which is represented in the cut, are possibly from a different species of Oak. *J. C.*

New Plants.

113. Lychnis Sieboldi, *Van Houtte Fl. des Serres, t.* 980; *aliàs* L. grandiflora alba *Siebold.*

This is very like the old orange-coloured L. grandiflora; but its flowers are pure white. It differs further in having downy stems, but little swollen at the joints, and no bracts at the base of the calyx. For a plant with white flowers it is very handsome. In the summer it will be a hardy border perennial; but in winter it must be treated like a Scarlet Pelargonium.

114. Aphelandra variegata, *Morel in Van Houtte Fl. des Serres, t.* 981.

115. Aphelandra Porteana. *Id., t.* 984.

Two magnificent stove plants, equal in magnitude to the old Aphelandra cristata, but much more handsome, according to the published figures. The great bracts

* Trans. Ent. Soc., vol. ii., pl. 3, fig. 4.
† Trans. Linn. Soc., vol. xvii., p. 445, with coloured plate.

are brilliant orange, and the flowers yellow in both, and the leaves are large, thick, undulated, and variegated. They differ chiefly in the inflorescence, which in the first is long and narrow, with close pressed bracts; and in the second short and broad, with great spreading (squarrose) bracts. Both are Brazilian, from Bahia, introduced by M. Morel, of Paris.

VEGETABLE PATHOLOGY.—No. LX.

268. Apostaxis. — *Constitutional and Organic* or Accidental.*—2. Gumming. — The fluid contents of the cells in a vast variety of plants hold either in solution or suspension a variety of matters differing from each other in more or less important characters, known under the general name of gum. Some of these, like arabine, are perfectly soluble; others, like bassorine and pectine, not truly soluble; while others, like the gum of Cherries, consist of two parts, one of which is soluble, the other merely capable of swelling up and becoming soft under the presence of water. The formula of pure gum is C_{12} H_{11} O_{11}, or identical with that of Cane Sugar, and in consequence its transition into starch C_{12} H_{10} O_{10}, or the contrary, is a simple subtraction or addition of water, while its conversion into cellulose whose formula is identical, is a matter of equal facility, provided there be light and heat enough for the purpose. In due proportion, gum is, in fact, one of the most indispensable vegetable constituents. Besides these gums, or their allies, which become hard when dry, another substance called mucilage, differing in being less hard when dry may be contained in the fluid of the cells, and in the course of fermentation a viscid matter often arises, producing the appearance which is called ropiness, which when dry approaches very closely to the characters of arabine. Both in health, therefore, and disease, the cells may be gorged to a greater or less extent with these matters; and it is obvious that in many cases where they are formed in great abundance it may be necessary for health to eliminate a portion, or the rupture or decomposition of cell walls may set a portion free which might otherwise have been retained without inconvenience. A portion of these gummy matters finds a receptacle in the intercellular passages which, in some cases of disease, are in consequence greatly distended. A portion, again, is poured out into especial reservoirs or ducts, as in the gum ducts of the shoots of the Lime, or the bassorin bags of salep, where they are ready for any exigency without being present in the general fluid to such an extent as to impede its motion; but even where there is no especial deposit of gummy matters in particular cavities, the sap is often so highly charged as when emitted to dry in a few minutes into a gelatinous globule.

269. To a small extent, again, elimination may take place through the stomates without any lesion of the cell walls. The little transparent free globules which occasionally occur, hardening on prolonged exposure to the air on young shoots, as in the Vine, when vegetation is active, are probably due to such a cause, and the sebaceous matter which occurs on the leaves of several plants may sometimes have a similar origin, as is certainly the case with some other substances, as for instance manna. The quantity of gummy matter, however, which escapes in this way is comparatively small. In the Acacias, which yield gum Arabic, and the Goat Thorns from which the gum tragacanth or bassorine oozes, in Anacardium and many other plants, the production amounts to something very considerable in the course of the year. It seems quite impossible in these cases that the process should take place without the rupture of the cells, whether proceeding from the general tissue or gum sacs in the bark, and indeed whatever may be the mode in which it is first given out, whether by simple percolation through the walls of the cells or other cavities, or in consequence of their rupture, the accumulated matter could never find an outlet without a rupture of the superincumbent bark. The consequences of this exusion, which seems to be normal in the cases mentioned, have not, as far as I am aware, been studied minutely. Those species which are subject to the phenomenon in their own warm climate, when cultivated in our conservatories do not exhibit it, or in other words they do not form more gum than is absolutely necessary for their exigencies. Whatever be the case, however, with the exotic plants which yield such enormous quantities of gum,† the evils which result from the similar process in our Plums and other stone fruit are unhappily notorious to every cultivator. The first overflow of gum from the cells or ducts may arise in various ways. It may be the consequence of too great a concentration of the sap, as where branches are trained horizontally, or, far more, where they are deflected; the cells or ducts may be ruptured either in consequence of excessive heat or cold; the cell walls may be weak and diseased by reason of ungenial temperature or bad drainage; or the gum may be deposited in such quantities as to force a passage; but in every case where gum has once protruded from the cells there is seldom any natural cessation of the process. As the cavities in which the gum was contained are emptied, a fresh supply is constantly poured in from behind, the original superabundance being kept up from the continuance of the same causes which first produced an overflow. In the first instance, the point of issue, which may be traceable either to the wood or bark, may be almost microscopic, but if it is watched it will be seen to extend gradually, and as gum alters in consistence with every alteration of the hygrometer or with every shower of rain, there is a constant action of external moisture on the cells—a circumstance which very rarely takes place without producing decomposition. The gum in consequence alters in colour, being impregnated with ulmine or allied substances, and disease and decomposition gradually extend till the whole circumference of the branch or trunk is corroded, and the tree, wholly or in part, perishes. From the very nature of the case it is difficult to apply a remedy. The first indication is to avoid every circumstance of climate or of treatment which may induce the condition, to prevent the effect of sudden changes from drought to excessive moisture by keeping the ground properly moist by watering or mulching in very dry seasons, to keep the branches thin and properly pruned, so that the gum which is contained in the general current of sap may be fully elaborated and not poured out too fast into the gum ducts, on account of its superabundance, and when the disease condition has once been set up, to cut out with a very sharp knife as cleanly as possible the affected parts. When collodium can be obtained at an easy rate, it may probably become a useful item in such processes, as it will exclude the outward air, and possibly prevent the first flow of gummy matter from the wound made by the knife, which might afterwards lead to a renewal of the evil.

270. The exusion of gum is sometimes a mere symptom of disease, as in many of the cases just mentioned and in the affection which has of late years been so prevalent amongst Cucumbers and Melons. The walls of the cells are in parts unable to resist the pressure upon them, and their fluid contents in consequence ooze out. This is equally the case in the Cucumber disease in the fruit and branches, and it is I believe one reason of the distortion, especially at the upper part of the fruit, which is so common a feature of the disease.

271. An interesting case is mentioned by Meyen, in which large masses of gum were deposited in the pith of a Cycad, so as in great measure to replace it. A large and very old stem of an Encephalartos, in the royal garden at Potsdam, refused under any mode of treatment to send out roots. It was at length divided, and many large cavities, one alone attaining the dimensions of 4-5 cubic inches, were found in the pith filled with brown gum, whether by some decomposition of the juices intended to supply the fecula of the pith or of the fecula itself‡, or by immediate exusion from the woody cylinder did not appear. The excessive formation of pectic acid in certain roots which are known by the Indians of North America under the name of Tuckahoo, will be considered under a future Number. *M. J. B.*

* Where the exusion of gum is purely functional, it hardly partakes of the character of disease, except so far as it may be symptomatic of other affections.

† De Candolle mentions a piece of gum from the trunk of Anacardium occidentale, which weighed 42 lbs.

‡ Morren believes that the gum ducts of Cycads are certainly supplied by the abundant fecula, acted on by an acid produced in the leaves, and he is inclined to generalise on the production of gum in other cases. Certain it is at least that in the gum-bearing Acacia fecula is deposited in great quantities in the ducts of the stem.

DIPLADENIA CRASSINODA.

Under good management this is one of the most useful of stove twiners, but to have it in anything like perfection, a warm moist atmosphere and careful treatment are indispensable. It is easily propagated; cuttings selected of rather weak young shoots when about 3 inches long, slipping them off with a heel, root readily if properly treated. The cuttings should be planted in a well-drained pot in sandy peaty soil, covered with a bell-glass, and plunged in a brisk bottom-heat, taking care not to overwater them, as any excess of this element would be apt to rot the tender cuttings. As soon as they are perceived to be moderately rooted, pot them singly in small pots in a mixture of good strong rich peat and decayed leaf-soil, well incorporated with plenty of silver sand. After potting, the young plants must be placed in a warm moist situation, kept close, and shaded from bright sunshine until they get established. There is no situation so suitable for the plants after potting off, or indeed while vigorous growth is wished, as a properly worked dung-pit.

As soon as the pots get filled with roots attend to shifting into larger ones, and do not allow the plants to receive any check for the want of pot room, until they are well-rooted in 6 or 7-inch pots. The cuttings should be put in as early in spring as they can conveniently be obtained, in order to allow of having them good strong plants before winter. I will suppose, however, that a good vigorous healthy plant in a 6-inch pot is in stock, and intended to be grown into a good specimen for blooming this summer. Turn the plant out of the pot at once, and if the ball is covered with healthy active roots, shift into an 11-inch pot, using the same soil as recommended for young plants with the addition of a small proportion of thoroughly-decayed cow or sheep dung, and some clean small potsherds or lumpy bits of charcoal. Let the compost be broken up into nice lumpy pieces, selecting only the very prime; and have the mould when used in a proper state as to moisture, and also at about the same temperature as the ball of the plant; and in potting make the fresh soil rather firm about the old ball. Apply a trellis, and train the shoots thinly and regularly to it; and keep them regularly tied in as they advance in growth, bearing in mind that a larger trellis will have to be applied, and that, if the shoots are allowed to get entangled or twisted around the wires, they will be troublesome to take off the trellis. After shifting, plunge in a brisk bottom heat of 85° or 90°, and maintain a temperature of 75° to 85°, syringing the plant over head frequently in bright weather, but be very careful in the application of water at the root for some time after potting, and use means to ascertain the exact state of the soil before watering at all, giving enough at each application to thoroughly moisten the ball, and no more until it is absolutely wanted. When the sun becomes powerful, a thin shade for a few hours on the forenoons of bright days will be useful, and will obviate the necessity for giving much air, and allow of keeping the atmosphere moist; but shading must be used sparingly. If all goes on well the plant will make very rapid growth, and soon fill its pot with roots; and when this is the case, shift into a 15-inch pot, using the same compost, &c., as for the last shift. Apply the trellis at once on which it is to be flowered, and train the shoots neatly and regularly to it, taking care to well cover the bottom, and return the plant to bottom heat, and where it can be liberally supplied with warmth and moisture. The same caution in watering will be necessary until the roots get hold of the fresh soil as after the former shift. It is astonishing how vigorously this plant will grow when kept in a warm and properly moist atmosphere, and carefully attended to; and with good management it should cover a large trellis, and be in full beauty, by the middle or end of June.

When the specimen is fairly set with flower, an occasional watering with manure water made from sheep dung will be of great service in maintaining the vigour of the plant, and will also increase the size and colour of the flowers. Where it can be avoided this Dipladenia should never be removed to the conservatory, or to a cool-house while in bloom, for although with care in preparing it for the change it may be placed in a cool-house for a few weeks when in full bloom, its beauty is soon over, and its flowers soon become smaller and much paler when removed from heat, and it should be allowed to remain in the stove in bottom heat all the summer, where it will bloom for months in succession. Towards autumn the supply of water to the soil should be limited in order to get the wood well ripened, and it will require very little in winter, when it should be kept comparatively inactive for some two months. Although I greatly prefer young plants to old specimens that have bloomed, having always found them to grow more vigorously and produce finer foliage and larger higher coloured flowers, the latter are not to be disregarded where proper young plants are not at command. The present is the proper time for starting old plants into growth, particularly if they are wanted for the June and July exhibitions. The shoots should be removed from the trellis, turning the plant out of the pot, reducing the ball as much as can be done without injuring the stronger roots, and carefully cutting away any bits of the tubers or roots that are found to be diseased. Repot in the same sized pot, and plunge in a brisk bottom heat, but give no water to the soil until active growth commences. Only maintain a moist atmosphere, and syringe the plant lightly morning and evening. Let the trellis be applied at once, and after cutting out all weakly shoots, and shortening the others to strong well ripened wood, train the shoots thinly and regularly over the trellis, and otherwise attend to the plant as directed above. *Alpha.*

OAK PLANTATIONS.

The writer of the following lines, believing that he has for many years past adopted and carried out a system most conducive to the growth of Oak timber, and which may be seen in its various stages from the seedling to the large tree in the near neighbourhood of the New Forest, desires to call the attention of those taking an interest in the present questions of what is right and what is wrong in the management of the Royal Forests to the simple method adopted by him, to keep the woods at —— in full crop, robust health, and luxuriant growth. This has been accomplished after much observation of, and comparison between, kindly growing woods and those of a contrary nature, by endeavouring to secure to the latter, as far as possible by artificial means, the advantages which soil and situation have supplied to the former, the most important of these being complete drainage and necessary shelter, the first by open ditches, the second by planting Larch or Scotch Fir, the first as the best nurse in old neglected woods, the last in newly enclosed moors or heathy ground—thick planting in each case being essential, but in the last the young Oaks are not introduced until the Firs have become of sufficient size to thin, by which time they will have so prepared the ground by shading, and the decay of their leaves and other woody and vegetable substances, that the Oak will soon overtake them in growth, and require especial attention. Here the care and judgment of the forester become of the most vital importance to the future welldoing of the plantation, which if properly and timely thinned, so as to give headroom and yet shelter to the now growing Oaks, they will, in a few years, begin to overtop the nurses, and may by degrees be so inured as to bear exposure to every wind except the south-western, which in Hampshire is the prevailing one, and against the effects of which great care should be taken, by having some old Fir nurse trees intermixed with the Oaks for shelter; indeed this would be found beneficial on all exposed sides of the plantation, and ought never to be overlooked.

Whether in old natural woods or in new plantations, the writer has found it of the utmost importance to rear the Oaks thickly, and thin them out gradually, thus causing rapid growth, and by keeping up the shelter

containing it, also giving time for the forester to choose the finest trees from which to select hereafter the future crop. For from the earliest stages of growth certain plants will take the lead, and are distinguished by their vigorous growth, regular supply of branches, and one leading shoot. If care be taken when thinning to select these at proper distances, all the others may be weeded away by degrees; enough being, however, left to give sufficient choice at the final thinning, which should not take place until the trees intended for the crop are beginning to form their lofty, broad, and well-balanced heads.

Having thus secured a sufficient crop, it will rarely be necessary to cut a branch from any tree intended to stand for timber; but should it be found so, by either the too vigorous growth of a branch or the interference of a rival leader, it will be best to subdue them by shortening back to a subordinate lateral shoot. A wood managed as here described will become matured and ready to cut at a much earlier period than under the management generally pursued.

In large estates the cuttings can be so periodically arranged as to secure the shelter and give effect to appearance also, by allowing a considerable distance to intervene between them. This would apply to small estates as well, when by the same management the beauty and utility will be maintained throughout.

Having above endeavoured to point out the plan begun by the writer about 40 years since to renovate and improve the woodlands under his care, and having, he hopes, succeeded in showing that his system is rational, simple, and based upon true principles, he will now proceed with some diffidence to make a few remarks on the management of the New Forest, with which he has been acquainted for a long period.

The late Lord Glenbervie, it is believed, was the first to attempt to grow the Oak under the shelter of the Scotch Fir, and he began by planting Acorns amongst them in the then new enclosures, but this proved a slow and uncertain method, and was abandoned by the late Mr. Turner, the deputy-surveyor, who raised the Acorns in seed-beds, and after planting them out in the nurseries for two or three years replanted them between the rows of Scotch Fir, a row of which was cut to make room for them, and which space was gradually widened as they required it; this they did very often, being greatly encouraged by the shelter, &c., and the writer remembers with the greatest pleasure to this hour the treat he had in a long day's ride through these plantations, which were then in full luxuriance; at the same time it was seen and remarked that a careful hand and an intelligent head would be required to carry on this amazing growth to maturity. Mr. Turner did not live many years after this, and, consequently, did not see the evils that were so soon to paralyse the work so well begun, and these flourishing plantations previously so tenderly dealt with were all able to withstand the fearful exposure they were now about to be subjected to.

The cry of economy had now gone forth, and the forest woodland (never long fairly dealt by from being always subject to the depredations of man and beast) began to be talked of as a source of wealth, and to make money everything saleable was pressed into the market, and instead of cutting the nurse Firs away gradually as the Oaks required the room (still keeping up sufficient shelter, as stated above), whole plantations were divested of their shelter, and in some instances the fences allowed to be carried away long before the young Oaks were sufficiently furnished to withstand the ruthless south-western gales or the inroads of the forest cattle. The demand for railway fencing having begun about this time helped on the devastation, and about four years since, in driving through the forest, the writer was quite shocked at seeing the desolation which had been made, and which nothing, he believes, but replanting with Larch to some extent among the Oaks, and keeping up the fence for some time, will retrieve.

Fencing in the New Forest, now the deer are gone, is not a question of great expense, as formerly. A good bank with a quick hedge planted thereon, and a single rail (if of sawed Larch) outside, would last until it had grown sufficiently to fence itself. But the most important subject for the weal of the forest remains to be considered, viz., the enclosing of the present woods. Were these treated as large woods have been at ——, since it was finally reclaimed from being common (as the forest may now be to a considerable extent, and ought to be for the good of the country and the timber hereafter grown therein), one acre would bear as much as two, and even more, and the timber produced of infinitely superior quality than heretofore.

The way to set about this, is to at once enclose as much of the old woods where there is timber fit to cut, or where it has been partially and recently cut, as far as the right of the Crown will allow, and clear them effectually of decayed, stagheaded, and other trees, not likely to become valuable as timber; and as often hereafter as any large timber is required, it should be cut in masses, that is to say, the ground should be entirely cleared and replanted with Larch, and in a few years it will be full of self-sowed thriving Oaks, at least such has been invariably the case for 35 years past. Should, however, there be found in these enclosures clumps of young growing Oaks, they should be allowed to remain without thinning until they begin to feel the influence of the Larch nurses, when they may be set out at proper distances to become timber. The effect of these and the undulations of the ground will still keep up the picturesque appearance and beauty of the forest.

CLIMATES OF FOREIGN COUNTRIES.—No. IV.

Nice, *Feb.* 9, 1855.—During the last week the weather here has regained its customary temperature, though there has been an excess of rain and clouds. General vegetation has made considerable progress, the Olive grounds are becoming covered with verdure. In some of them the wild Iris is making its appearance in great numbers; Almond trees, both pink and white, of a larger and more robust kind than those in England are in blossom, and also Strawberries in several of the gardens. The wild Anemone appennina is also in flower, and an entirely white Narcissus, rather small, both very pretty. Swallows have been continually observed on the wing, but owing to the great number of persons who shoot, either for sport or profit, and various descriptions of nets used, singing and other birds are rather scarce. A fine-looking plant, which has been in bloom for some time past, under slight protection, is the Sparmannia, which with its large green foliage and white flowers forms a striking object. Some Scarlet Geraniums are from 8 to 10 feet high against the walls, and in sheltered situations they have escaped the late frost; a plant of the large Oak-leaf variety 10 feet high, has also escaped. The upper parts of the Plumbago capensis, which attains about the same height, have suffered, and also the Lemon and Orange trees in many places, as well as the Cineraria grandiflora, whose leaves, very much resembling the Gesneria zebrina, until recently looked splendid. Banksian Roses grow very luxuriantly here, completely overrunning the garden walls—some of the white ones are in flower now. On the hills there are many bushy plants of the Coronilla coronata, which have continued flowering through the winter, and are now coming out more fully in yellow bunches.

On Monday last, the 5th inst., another earthquake was felt here, but not nearly so severe as the former shock, which took place on the 29th December.

At Brussels the temperature has been again very low. On the 1st inst. the min. was 15°, max. 28°; on the 2d it was 29° below freezing; it then became gradually warmer, and on the 5th the min. was 37°, max. 41°. At Lyons, on the 31st ult., it was 32° below freezing, and 29° below at Paris on the 29th. On the 3d inst. it had risen considerably above freezing.

COMMON THINGS.

Plants in Dwelling Houses.—This is a critical time for window plants in rooms, where fires are kept during the day, raising the temperature to 50° or 60°, but where it falls often 20° or 30° during severe weather, especially near the windows, after the fires go out and before they are relit. The consequences of such variations is seen in Camellias losing their buds, in the leaves and young shoots of other plants withering or shrivelling, and frequently in hard-wooded plants dying altogether. Almost the only precaution possible is to remove the plants, during such times as the fires are not kept up, to positions at the greatest distance from the windows. Camellias are general favourites, and had better be kept in a room where no fire is used, than where they are subject to great variations, as they will endure several degrees of frost without injury.

Management of Bulbs after Flowering.—Important points in the art of cultivating bulbs well are putting them to rest at the proper time, and while they are still in a growing state to place them so near the light, and to afford such a supply of air and water, as will enable them to bring their leaves to perfection, and elaborate the greatest amount of sap. The management of bulbs is, in general, but imperfect; and the importance of attending to these points, viz., the perfecting the leaves, and the putting the bulbs into and keeping them during a proper time in a state of rest, cannot be too much insisted upon. Bulbous-rooted plants associate almost as ill with all others as succulents do; and therefore wherever a good collection is kept, they are worthy of a house being entirely devoted to their culture. When dormant, they like nearly the same degree of heat, provided they are kept dry, as they do when they are growing.

Conservatory Borders.—During the winter months the moisture of the atmosphere in a conservatory will sometimes occasion Mosses, &c., to vegetate, especially if the surface of the mould has had time to become close and settled, thereby giving the house an untidy appearance. This should now be remedied by stirring the whole of the borders to the depth of 2 or 3 inches with a small fork, and raking it over smoothly with a close toothed rake. These tools should be furnished with short handles, so as to enable the operator to use them with freedom under the plants, by which means many branches and flowers will escape being broken off, which cannot be well avoided when awkward tools are used. As soon as they are raked let a coating of fresh mould be neatly spread over the surface, which will tend very much to give the whole a more agreeable appearance.

Home Correspondence.

Grafted Rhododendrons.—Messrs. Standish and Noble have addressed themselves to the defence of grafted Rhododendrons upon their real merits, and as they appear to bring to the discussion a real knowledge of the subject, we may hope for some better data than we have hitherto had upon which to form our decision. Their first proposition is that many years experience enables them to assert confidently "that there is no species or variety which might not be advantageously grafted, supposing that a suitable stock can be found." Before I can assent to this proposition, I must seek or request a definition of the word advantageously, which is somewhat ambiguous. If their assertion be that the plants will, altogether, and under all circumstances, flourish better for being grafted, I am compelled to join issue with them, and dispute this point. If the assertion be that there are certain circumstances and certain purposes, with reference to which the plants will be benefited by grafting, I am prepared to admit their statement. Their reasoning, however, on the subject, which consists in an induction instancing several species or varieties which do flourish better when grafted than self-grown, seems to point to the former proposition as the one which they wish to establish, and I am therefore justified in supposing that the general inference is the one which they wish their readers to draw from their remarks. The instances they allege are of two kinds, 1st, that of native species benefited by grafting, viz., certain Sikkim Rhododendrons. Now it happens that the species they cite, viz., R. Dalhousiæ and R. Edgworthiæ, are plants of most exceptional and peculiar habits—epiphytal shrubs—natives of a climate of extrordinary humidity, which it is almost impossible to imitate, and from the delicacy of their roots very much more difficult to cultivate than epiphytal Orchideæ. They are epiphytal Ericaceæ, and if Ericaceæ in pots are liable to suffer from extremes of moisture and drought how much more epiphytal Ericaceæ. Our only resource is to grow them in pots, where occasional excess of moisture and absence of air cannot fail to be injurious, if not fatal to them. They are, in fact, very difficult to manage. The discovery therefore that they can be transferred to other roots is a great boon to gardeners, which I thankfully acknowledge. It is found that a species, not fastidious as to soil or moisture, at its roots, will afford nourishment and support to one which is most fastidious, and I have no doubt these species do flourish better in cultivation when grafted than on their own roots. Nay, I am prepared to admit that they may flourish better and form handsomer plants when grafted than they can do on their own roots in their native woods, for their nurses are much more robust than themselves. But another class are instanced as improved by grafting; viz., cross-bred seedlings; and here I must beg leave to demur not to the facts but to the inferences. No doubt the shoot of a seedling transferred by grafting to a well-rooted plant may attain an earlier maturity than the seedling itself. It is supplied with roots, and has not to make them. It attains vigour quickly, and maturity soon follows. Mr. Knight was in the habit of thus inducing early maturity to his seedling fruit trees, and enabling himself to test their merits at an early age. But the question of duration and ultimate vigour is totally different, and the very fact of early maturity would, I think, induce all persons conversant with the analogies of vegetable life to decide against such plants. They are advantageous, inasmuch as they enable the cultivator to ascertain the value of his produce easily, and they may be advantageous in enabling him to realise an early profit on it by sale to those who are not particular as to duration, and they may be advantageous to those who wish for compact bouquet-like plants which will afford them flowers, and who wish to have many varieties in small compass, but they cannot be advantageous in exhibiting the ultimate stature and natural growth of the plant to those who admire it for its habit and colour of foliage, and who are content to wait some years for its full and mature perfection, and to look forward to others enjoying and admiring it after them. In their remarks upon suitable stocks Messrs. S. and N. make one observation which tends strongly to confirm my views:—"All the hybrids in cultivation grow well upon hybrid catawbiense, especially if the hybrids so grafted are strongly crossed with catawbiense." That is to say that luxuriance of growth is precisely in proportion to the hereditary affinity between the graft and the stock: if such be the case, the closer the affinity approaches to identity the greater the luxuriance. Now a further confirmation of this view is the fact that hybrids on their own roots do not flower readily; they grow so luxuriantly that they require some years to attain maturity; but when they do flower nothing can equal their splendour. I have waited patiently many years for the flowering of some of my own plants, but when once they began to bloom they had left me nothing to desire. I do not profess to enter on the subject of various stocks. I know that many which I have seen have been grafted on R. ponticum, the growth of the stocks affording unmistakeable evidence of this. I suggested R. maximum arboreum simply from its luxuriant growth. It is, however, singularly shrub-like in its habit, and this may be the reason it proves unsuitable to arboreous species. I am glad to find from Messrs. S. and N.'s remarks that attention has been paid to the stocks, and the most suitable kinds ascertained and employed by them. Perhaps if I had only met with such plants I should have found less reason to complain; but it is evident from the

remarks of other nurserymen that all are not so particular as to the stocks employed. The subject appears now to have received all the elucidation it is likely to attain, and its discussion has not, I think, been unprofitable. I think I am justified in drawing the conclusion with which I started, that although for certain purposes grafting may be advantageous, the full splendour and perfection of cross-bred Rhododendrons is only to be looked for from self-rooted plants. *J. R.*

Winter Figs at Singleton and Welsh Gardening.—A residence of several months prior to Christmas, and a visit sometimes thrice a week to Mr. Barron enable me to confirm all that he has said at p. 86 on this interesting subject. On three different occasions in December I had an opportunity of tasting the fruit, and on Christmas day I ate one in every respect excellent, perfectly ripened, and I may say quite equal to many which I have tasted in May and June, though I am quite certain by no means so good as it would have been in a drier atmosphere and under more direct light. The kind I am inclined to think is quite distinct and new, and I believe was brought from Italy by the late J. H. Vivian, Esq. It is white, much smaller than the Marseilles, and prolific as an Orleans Plum, every joint of every branch of proper growth being studded with a fruit. I suggested to Mr. Barron to call it the "Singleton Perpetual," which name I think it is entitled to bear until we find some prior claim to its introduction. [Mr. Barron, in a letter just received, entirely confirms this statement.] With a score of plants of this Fig, I should have no fear of producing a dish every month in the year. Mr. James, at Pontypool Park, speaks of having Strawberries "ten months in the twelve," but this Fig I have no doubt will beat his. Ripe Figs at Christmas are certainly a novelty—ripe Strawberries not quite so unheard-of a circumstance. I may, however, as well place a Laurel branch on the brow of another Welsh gardener, Mr. Floud, gr. to R. Fothergill, Esq., at Abernant, near Aberdare. I there saw in the middle of October one of the finest houses of Melons I ever beheld at any season, the third crop from the same plants. Mr. Floud, in sending me some seed of one of the kind, remarks:—"The green flesh is small, but excellent in flavour. Mr. Fothergill told me that the fruit of it was delicious in December. I sent my last Melon to table on Christmas day!" These Melons were growing in a recently erected house (indeed the glass at Abernant is all new) in a bed heated by hot water, and the plants and foliage were as clean, free from insects, and full of health in October, as they are generally seen in April or May. *W. P. Ayres, Whittlebury Lodge.*

The Weather.—Allow me to call attention to the temperature of the night of Saturday, the 10th and 11th, the coldest, I believe, for the last 20 years by 3°. It was as follows:—Wallingford, 0°; Croydon, 9½°; Highfield House, Notts, 11° 5′; Hyde Park, 16°; Truro, 13°. *T. P., Porthgwidden, Truro, Feb.* 17.——This place is six miles from the sea, six miles from the purlieus of Dartmoor, nearly equidistant from Newton Abbot and Totness, and forms the watershed between the rivers Dart and Teign. Here the thermometer, during all this cold, has not been under 28°; and only on one day, Friday the 16th, has it fallen below 30°. The snow, which fell thickly three and four weeks since between this and the sea, has dried out, whilst clouds of dust, urged on by the fierce easterly wind, are passing without intermission before the windows, covering everything, and have so done for the last eight days. The rills in which water is flowing, few in number, are not frozen over. Our great want is water; and so it has been for many months past. I have three men levelling a bank of earth, 60 yards long, about 2 wide, and 4 feet high. The crust is frozen 2½ inches in depth; then follows 8 to 9 inches of moderately damp earth; but all underneath is quite dry. Your readers may remember that in the third week of December 1853, all the kingdom suffered much from a heavy storm of wind and rain. Here it was very violent; more than 3 inches of rain fell in 18 hours, and the damage done was very considerable. Houses were flooded, ponds had their buttresses washed away, hedges were overturned, and many fence walls, overthrown by the waters, were washed in large masses away some distance from their foundations. From that time, fully 60 weeks, we have had no rain worth speaking of. In January, 1854, we had a smart snow shower, which dried away; but no rain to swell the waters followed. In February, early in the month, 5 inches of snow fell, and again dried away; and now a curious phenomenon, which has continued to this time, might be remarked. If the rain was apparently about to fall copiously, the wind at south-west driving up enormous masses of clouds, and everything portending a heavy rain, the rain fell, the wind quickly abated, became westwardly, and in a short time north-west, with a clear sky; and generally in two or three days no vestige of rain remained. In no case whatever here in 1854 did it rain, at any one time, 4½ hours. Our annual fall of rain is from 20 to 21 inches. Last year it barely amounted to 14 inches. As might be expected, seeds vegetated badly; hay was short; Turnips a failure; and numerous Apple, fruit, and other trees died from the drought. In this parish there are nearly 150 acres of watered meadow; on this day (Feb. 20) they ought to have a foot in depth of Grass all over them, and be of a most brilliant emerald green. They are bare, brown, and desolate. Wells are dried up; springs in the fields have failed; and the universal scarcity of water causes much complaint, in February be it remembered. But if there be so great a lack of water, there is no lack of this fierce, arid easterly wind, burning up everything, and overwhelming us with dust. Φ.

Pentstemon.—A fine plant of Pentstemon azureum in a south wall border seems to be killed. I believe the majority of this genus, so numerous in its species and varieties, is hardy; but I should be glad if any one would furnish me with a list of those which are not so. I ask it in the negative, merely under the impression that the affirmative applies to the greater number. They are tall plants for frames, but excellent for the border; but one does not like getting things to have them killed. In all cases where the sorts of an ornamental genus vary in that respect, such lists as I have asked for, furnished by general cultivators, would be most desirable matter for many of your readers, always giving the list (as above suggested) which is shortest. *A.H.*

The Winter of 1813-14.—The duration and severity of the present winter having brought to my recollection the long frost of 1813-14, I have looked up some notes I made at the time, which may be interesting to your readers. Thermometers to register the greatest cold were not made at the time, or were very rare, so that I can only give the degree of cold shown at 8.30 A.M., and that not for every day; perhaps some correspondent can supply this deficiency. "The long frost commenced on the 26th December, 1813. The thermometer stood between 12° and 22° for the first three weeks, taken in the morning at half-past eight; during this period there were two inconsiderable falls of snow. The days were generally sunny and serene, with moonlight nights, the wind N. and E. At the beginning of the fourth week there was a considerable fall of snow, with high winds, which continued several days. The snow drifted to such a degree that all communication was cut off with distant places and with the villages near Cirencester, until a passage was opened, the drifts being from 4 to 10 feet deep; the average depth of snow was 15 inches. An invariably hard frost, with occasional snow, completed the fourth week. At the beginning of the fifth week, the wind being steady to the N., the frost was very severe; on the morning of the 25th January the thermometer was 10°. In the course of that day the wind changed to the S., and a thaw of short duration took place during the day, freezing at night. Rain at first accompanied the thaw, with variable winds, which completed the 5th week. The wind again went to the N., producing clear frosty weather, the powerful effect of the sun occasioning a partial thaw during the day. On the night of the 3d February, two dim concentric circles appeared round the moon; these were followed by a cloudy atmosphere, and on the 5th by a S. wind with snow, after which a rapid thaw took place, and only the drifts of snow remained, but it soon changed to frost with keen winds, which continued to the end of February. A slight tendency to thaw marked the beginning of March, followed by steady frost for a week with N. wind, which, with a little snow, continued to the 12th. The snow assumed very regular crystalline forms at this time, sometimes falling slowly, when no clouds were to be seen, the wind being still. A week of E. wind with severe frost preceded an appearance of mist, which rather increased until the 20th March, when the wind changed to the S., and brought mild weather and rain, making altogether 12 weeks winter." *Thos. C. Brown, Cirencester, Feb.* 17.

Black Barbarossa Grape.—A correspondent inquires whether this Grape will force with the Black Hamburgh, and be equal to that variety as a cropper. I can answer his inquiry in the affirmative, having some plants in pots which have shown, set, and grown as freely as a Muscadine or Miller's Burgundy. To its "non-shrivelling" qualities under a summer's sun I cannot speak. *W. P. Ayres, Whittlebury Lodge.*

Underground Manuring.—The system of tilling Celery with liquid manure by means of underground drains was practised successfully at Carr House, near Doncaster, upwards of 10 years ago, by James Stevens, gardener. Those who sneer at this mode of manuring, and say that it is folly to drain, if it is proved to answer, should bear in mind that the liquid is not intended to remain stagnant in the drain, and that Celery grows spontaneously in ditches and watercourses. *D. S., Gardener, Campsall Hall, near Doncaster, Feb.* 20.

Gardening News from Australia.—The following extract from a letter just received from a gardener now residing in the neighbourhood of Adelaide may be interesting to your readers. He says:—"I am very comfortable here, at least as far as circumstances will allow me, being apart from my family. I have been for six weeks past grafting fruit trees, and have been getting 20*s.* per day, or 6*l.* per week. The garden or nursery contains 80 acres, all of which are planted with Plums, Apples, Pears, Cherries, Apricots, Peaches, Figs, Oranges, Lemons, Grapes, and all kinds of Nuts and other varieties of fruit trees. They tell me that the trees bear exceedingly well—indeed I should say so from the appearance of the blossom. The proprietor during the past year made 42*l.* from one Apple tree in ready cash. They sell from 1*s.* to 1*s.* 6*d.* per lb. They have very few of the best English fruits here. I am collecting together all the native plants, and intend forming an herbarium; some of them are very beautiful, with brilliant colours and excellent form, and are quite new in England." We should say that 20*s.* per day is an excellent wage for grafting, and 42*l.* is a large sum to be made from one Apple tree. It must have been most assuredly the true Golden Pippin. We know that we have about 8 acres of Apple trees in Devonshire, and did not make so much from the whole lot during the past year. The letter is dated Sept. 26, 1854, only six days after the Battle of the Alma, so that your readers will have the latest gardening news from our distant colony. *William E. Rendle and Co.* [This corresponds with the statement lately made concerning Mr. Carton. But unless we are much misinformed, the cost of all articles of food and clothing is so enormously high that, after all, 20*s.* a day in South Australia are not much better than 3*s.* here.]

Rhododendron glaucum.—The magnificence that we are taught to expect, and which we shall doubtless find in the flowers of some of the species of Sikkim Rhododendrons, will, I fear, induce many to overlook the claims of other humbler, but nevertheless useful and interesting kinds. Among the latter is glaucum, a neat, compact plant, growing, Dr. Hooker tells us, on its native ridges, about 2 feet high. Its leaves are small, pale-green above, but beautifully glaucous beneath—so much so, that they appear coated with a film of silver leaf. The plant is very hardy in our climate, and blooms freely in the open ground early in May. Its flowers are rose-coloured. Ladies, if you would have a little hardy plant, worthy of all the care and admiration you so well know how to bestow on a favourite, and have a square foot of a cool peat border to grow it in, lose no time in ordering a plant of Rhododendron glaucum *G. W. L.*

Societies.

Entomological, *Feb.* 5.—The president in the chair. The secretary read the minutes of the anniversary meeting held on the 22d January, at which Mr. Curtis was elected president in lieu of Mr. Newman, whose period of office had expired, and Mr. Edwin Shepherd was elected joint-secretary with Mr. Douglas, in the place of the late Mr. W. Wing. After the list of donations received since the last meeting had been read, the newly-elected president read an address, thanking the society for his election as president, and nominating the three vice-presidents for the following year, namely, Messrs. Westwood, Newman, and Stainton; and which, upon the motion of Mr. Spence, was requested to be published in the proceedings. Mr. Newman presented a drawing exhibiting the transformations of Saturnia Spini, with specimens of the silk spun by its larva, in the manner suggested by Herr Pretsch, of Vienna, and described at the last meeting of the society. Brigadier Hearsey communicated an extract from the "Bengal Journal of the Asiatic Society," Vol. VI., 1837, relative to the mode of spinning off, instead of reeling the thread from the cocoons of the Eria silk-worm in India, this being the species now attempted to be raised, with every prospect of success, in Malta and the South of Europe. Mr. Stainton exhibited some of the galls of the Cynips Quercus-petioli from Devonshire, Mr. Curtis having doubted its occurrence in that county at a former meeting. Mr. Stainton's correspondent gave some particulars relative to the habits of the species, which is only found on the lower sprays of the Oak. Mr. S. Stevens exhibited several splendid specimens of the remarkable and rare Cheirotonus MacLeaii from India. Mr. Newman read a note entitled a "Plea for the cockroach or black beetle," stating that it had been observed to feed upon the bed bug, and this habit on board ship had been noticed in Webster's "Narrative of a Voyage to St. Helena," and in Foster's voyage. Brigadier Hearsey stated that the cockroaches on board the vessel in which he last returned from India were so numerous that they gnawed the nails of some of the passengers down to the quick whilst asleep. Mr. Curtis communicated a notice by Dr. Asa Fitch on a species of scale insect which infests the fruit trees in the State of New York, adding that the authorities of that state had commissioned Dr. Fitch to draw up a memoir on the insects injurious to fruit trees. He also read a note from M. Candeze requesting the loan of species of Elateridæ for his monograph on that family. Mr. Douglas read a note on Psyche helicinella, and Mr. Westwood descriptions of a number of new exotic Lucanidæ. Brigadier Hearsey exhibited several cases of beautiful insects from Sylhet, some of the greatest rarity.

Notices of Books.

Le Chili; par B. Vicuña Mackenna (Paris, Bouchard-Huzard), is a small 12mo. treatise upon the natural resources of Chili. It is in reality an eulogium of the inexhaustible wealth of that country, and is intended to promote emigration thither. The information it conveys, notwithstanding the author's grandiose manner, is abundant; but it must never be forgotten that the statements are those of an advocate. Mr. Mackenna's accounts of mineral wealth are quite dazzling, and yet English enterprise has not hitherto found it profitable to work it. In fact, the difficulties of Chili are understood to consist in the scarcity of good labour and the dearness of provisions; and till both become abundant we fear that the treasures of the country must be gathered by natives rather than by strangers. Making allowance for matters like these the reader will gather a good deal of information concerning the climate and natural productions of the country. In what manner it is conveyed the following short extract will show:—

"Go where you will on this American soil, misunderstood and calumniated as it is, you will be received like a brother. Go to Peru, La Plata, New Grenada—where you will—one single family is found everywhere. No

petty pride is there. Let South America only unite, as the great Bolivar would have had it, and its misfortunes will disappear; it will have conquered its true place in the world, and once more rejoice in the name of America. Prejudices there are, no doubt, but they will disappear in the presence of the worthy and enlightened men who entertain no extreme ideas, and are far from thinking emigration (immigration!) an evil. To be sure we have earthquakes; but you need not be afraid—earthquakes hurt nobody. More people perish on board the steamers and in the rivers of the United States in a month than in Chili in a century. In fact, I give you my honour that in the somewhat monotonous life of the country, these shocks are perfectly harmless, and rather entertaining. In fact, they serve instead of the opera, and when they happen they give us something to gossip and laugh about in the evening."

A new edition (the fifth) has appeared of *Fenn's Compendium of English and Foreign Funds*, by Mr. Ayres, the editor of the "Banker's Circular" (Effingham, Wilson, 7*s.* 6*d.*) The work is doubtless of great value to money dealers and share dealers of all classes; and we suppose that good reasons can be given for the omissions which we remark, as, for instance, that of the Crystal Palace Company.

Literary Papers, by the late Prof. Edward Forbes (Reeve, 6*s.*), form a neat 12mo of 300 pages, and consist wholly of communications by the late lamented author to the "Literary Gazette." They are very characteristic of his lively unaffected manner and rich stores of accurate knowledge.

Curiosities of London, by John Timbs, F.S.A. (12mo, Bogue), is a massive volume of 800 pages in very small type, giving an account of whatever the author knows of the curiosities of London, among which by the way are included many things, the curiosity of which we fail to discover. In the opinion of antiquaries this is a perfect mine of information, and they are the proper judges of its merit. It undoubtedly forms a good appendix to Cunningham's "Handbook of London."

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Orange trees in tubs and pots should be examined in order to ascertain the state of their roots, shifting such as are found to have their balls moderately matted with healthy roots, and in the case of such as may be too large to be conveniently shifted, remove as much of the surface soil as can be done without seriously injuring the roots, and top dress with some rich compost, as turfy loam, thoroughly decayed cow dung, and a little sand. Be particular to have the balls of large specimens in a moist state at the time of shifting, and use a rather strong rich compost. Plants of the mandarin, blood, and egg varieties, grown for the sake of the fruit, should now be encouraged with a temperature of about 55° at night, allowing it to rise to 65° with sun-heat during the day, for our summers are too short to properly mature the fruit, unless the plants are started early in the spring. See that the foliage is perfectly clean before placing the plants in growing circumstances, and afford them a moist atmosphere to prevent the attacks of red spider, with which and brown scale they are great favourites. Young plants of Fuchsias intended to form fine specimens for summer decoration, must be encouraged with plenty of pot room, and as high a temperature as they will bear without making weakly growth, keeping them near the glass, and affording them a moist atmosphere. Old plants for flowering later in the season may also be placed at the warmest end of the greenhouse, giving a little water to the soil to induce them to start into growth. We generally disroot and pot these in smaller pots before winter, but where this has not been done it should be attended to before starting the plants into growth, trimming the roots freely and repotting in light rich compost in as small pots as will hold the roots, and giving very little water until the plants get into free growth. Take every possible opportunity of admitting a little fresh air to soft wooded plants, as Cinerarias, Calceolarias, Pelargoniums, &c., for these, save in very favourable situations, are feeling the effects of fire-heat and confinement. Do not allow them to suffer for the want of pot room, and fumigate occasionally to prevent green-fly; also remove decaying leaves from Calceolarias, &c., immediately they are perceived. Look over Heaths and other hard-wooded plants very carefully, to see that they are not too dry towards the bottom of the ball, which sometimes happens with plants standing near the pipes when much fire heat has to be applied, and if this is found to be the case to any serious extent, place the specimen for a few hours in a saucer of water, letting the water stand a little higher than the drainage; also keep a sharp eye upon specimens liable to the attacks of mildew, and apply sulphur the moment it is perceived. Counteract the drying effects of fire heat by sprinkling the floors, &c., every morning, and lose no favourable opportunity of admitting fresh air, but do this carefully, and guard against cold currents or frosty winds.

FORCING DEPARTMENT.

Pineries.—The long continuance of cold frosty weather will, where there is not ample heating power, render it somewhat difficult to maintain a sufficiently high temperature for plants which it may be desirable to get to show fruit at once, for it generally happens that a brisk temperature is necessary to move the plants at this season. Where such is the case, fires should be kept going briskly during the day, keeping close and securing a moist atmosphere by sprinkling the floors, &c. It is nearly hopeless, however, to attempt to get plants to show fruit that have not previously well matured their growth, and been afforded a period of comparative rest. Therefore see to preparing plants for maintaining the succession, by keeping them rather dry at the root, and effectually checking their growth as soon as they are considered sufficiently large for fruiting. Do not allow young stock in pots to become too much pot-bound before shifting, and see that the balls are in a moist state at the time of potting. Aim at keeping these growing slowly, afford them a thoroughly moist atmosphere, and keep them near the glass in order to secure compact strong plants. Let the temperature range from 60° to 70° with fire-heat, allowing it to rise some 10° with the assistance of sunshine, and a gentle circulation of air. Plants swelling their fruit must be afforded a moist warm temperature of 70° at night, taking advantage of bright days to raise it to 80° or 85°, but see that the atmosphere is kept thoroughly moist, and if this cannot be done a lower temperature will be safer until the weather becomes more favourable. Vineries.—The last fortnight will doubtless be long remembered by those who have had the care of much early forcing, and it will be well if the remembrance be not in some cases accompanied with recollections of mishaps and failures which might have been guarded against. Certainly such a trial as that through which we have just passed has been new to many of us, and it may also have served to prove the inefficiency of heating arrangements, which hitherto had answered the purpose perfectly; and where failures occur it will be but fair that all things be taken into consideration. Give every possible attention to the border where the Vines are fairly started, and see that it is protected from the frost by a substantial coat of dry litter. Where fermenting materials are used for warming the border this must also be well covered from the frost, and a gentle fermentation secured by turning it on a sunny forenoon, and adding a rather liberal quantity of fresh materials in a warm state; for unless a steady heat can be maintained the use of fermenting materials is much more likely to be injurious than otherwise. Proceed with thinning the bunches and berries as soon as the crop is sufficiently advanced. Stop laterals, regulate and tie in the shoots, taking care not to leave too many for the space, and keep everything neat and orderly. Take every opportunity which the weather may offer of admitting a little fresh air, and maintain a moist atmosphere by frequently sprinkling the paths, &c. Injury is sometimes done to the young tender foliage of Vines by the vapour arising from the evaporating pans when the state of the weather necessitates overheating the pipes, and if there is any danger to be apprehended from this, a board should be suspended over the pans so as to diffuse the heated vapour, and prevent its striking the foliage too much in one place. Examine the leaves in the early house narrowly for red spider, particularly those near the pipes, and if the least vestige of this pest is perceived, wash every affected leaf carefully and at once, using a soft sponge and soapy water. This may appear a tedious plan to those who have not been accustomed to spend much time upon plant washing, &c.; but an active handy man will soon go over a good part of a house, and if the enemy is taken in time it will be easily eradicated by these means. Peaches.—Where the trees are not so far advanced as blooming, proceed very quietly under the present state of the weather; for it is not desirable to have them in this state until air can be admitted more freely than would be possible under the most favourable arrangements at present. In houses where the trees are in bloom, a little extra fire-heat should be used, so as to allow of the admission of fresh air whenever the external temperature is not very severe; but this should be effected by small openings near the pipes, so that the air may get warmed before coming into contact with the trees. Maintain a soft humid atmosphere where the fruit is fairly set, syringe the trees lightly after shutting up early on bright afternoons, and proceed gradually with disbudding the trees, and where the fruit is thick a portion should be removed as soon as it is safely set, but then so as to allow for a few falling, to which the Peach is liable until after stoning. See that the trees are properly moist at the root, giving tepid water where it is wanted. Strawberries.—These are somewhat liable to the attacks of green-fly when the weather necessitates keeping them rather close, and they should be very carefully looked over, and lightly fumigated once or twice if they are found to be at all infested with this pest. Do not exceed 50° at night until the fruit is set, and keep the plants near the glass, giving as much fresh air as can be safely done, and maintain a moist atmosphere except while the plants are in blossom, when every care should be taken to keep it rather dry.

FLOWER GARDEN AND SHRUBBERIES.

The principal thing demanding attention here at the present time is the providing of a sufficient stock of plants against bedding-out time. The stock of plants in cold pits and frames will doubtless, in many instances, have been considerably lessened during the last fortnight, and as the season is far advanced no time should be lost in getting those wanted for propagation placed in a moist warm atmosphere, to induce them to make free growth, with the view of obtaining plenty of cuttings. Except under favourable circumstances, it is very difficult to induce the general order of bedding plants to make anything like free stocky growth by means of artificial heat. If a pit heated by pipes is at command, where a little bottom heat can be obtained from a bed of leaves, mixed with a small proportion of well-worked stable manure, this, with proper management, will afford the best possible combination of circumstances for inducing such things to make free and strong growth; and strong short-jointed cuttings form established plants so much sooner, and at an expense of attention so small compared with long-jointed weakly cuttings that they are worth any care which may be necessary to obtain them. The command of a proper place for rooting cuttings is also a matter of great importance where a large number has to be got up. What is wanted is a brisk bottom-heat where the cuttings can be kept near the glass, and cool. It is very true that young wood of most bedding-out plants will root almost anywhere, but it is desirable to keep the cuttings strong and vigorous, which is a difficult matter when they have to be rooted in a warm close atmosphere. See to having plenty of light, rich, sandy compost ready for potting-off with, and, of course, cuttings must not be inserted in cold wet soil. Look over the stock of Dahlia roots, and place those wanted to afford many cuttings in heat at once, as also any that may not appear to be keeping well. Any Hollyhock cuttings which can be obtained should be put in at once, for unless these are got moderately strong before planting-out time, there is very little chance of their flowering at all strongly this season.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Feb. 22, 1855, as observed at the Horticultural Gardens.

Feb.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth 1 foot deep.	Temperature. Of the Earth 2 feet deep.	Wind	Rain

Average.		29.905	29.849	31.4	12.1	21.7	34.6	37.3		[illegible]

Feb. 16—Snowing; slight snow-shower occasionally; overcast.
— 17—Cold and windy; slight snow; clear; severe frost.
— 18—Intense frost; hazy; clear, with severe frost.
— 19—Hazy; clear and frosty at night.
— 20—Clear and frosty, with brisk east wind; overcast; clear.
— 21—Severe frost; partially overcast; hazy clouds; overcast.
— 22—Hazy; dry air and uniform haze; slight snow in the night.

Mean temperature of the week 17¼ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK.
During the last 29 years, for the ensuing week, ending March 3, 1855.

Feb. and March.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Wind. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 25	48.1	33.1	40.6	15	0.92 in	4	1	5	1	4	6	6	[illegible]
Mon. 26	47.3	33.2	40.3	16	0.48	5	2	3	4	1	8	4	[illegible]
Tues. 27	47.8	34.3	41.0	15	0.40	3	5	3	2	5	6	4	[illegible]
Wed. 28	48.7	34.0	41.4	11	0.81	—	6	5	—	2	5	3	[illegible]
Thurs. 1	47.4	34.4	40.9	12	0.62	—	5	2	—	5	10	4	[illegible]
Friday 2	49.1	36.0	42.5	10	0.45	2	5	2	1	4	7	6	[illegible]
Satur. 3	49.5	33.1	41.3	13	0.28	3	8	1	3	3	5	5	[illegible]

The highest temperature during the above period occurred on the 28th 1846—therm. 64 deg.; and the lowest on the 1st, 2d, and 3d, 1854—therm. 18 deg.

Notices to Correspondents.

Books: *J D.* Glendinning on the Pine, and Hamilton on the same subject, will give you all the information to be obtained from books.—*A Young Forester.* No single volume will give you the information you seek. That of Brown is the best practical work in this country, but if you wish to understand the subject, you must read many books, and especially the greatest of all, that of Nature. Duhamel's "Physique des Arbres" contains a vast quantity of valuable information.

Glazing: *P Q.* If you glaze your roof with great squares placed lengthways across from rafter to rafter, you must submit to the drip that must attend the plan, unless your squares overlap as usual. That fault cured, the next is that if your sashes are moveable, great breakage will follow, and if fixed, it is still to be feared where glass has a 3 feet bearing. Pyramids planted a year ought not to require stakes, for their roots should be in that time sufficient to keep them securely upright.

Heating: *M W K.* Unfortunately your sketch is made by some one who cannot draw, and we do not understand it. Perhaps the narrow junctions are choked up by incrustations; perhaps the flow-pipe comes from the bottom of the boiler instead of the top (such indeed would seem to be the case according to the sketch). Junctions should be of greater, not less diameter, than the pipes themselves if there is any difference.

Manures: *L S W.* We know nothing of it, and we advise you to take care how you become acquainted with it.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—1, Pteris serrulata; 2, Cyrtomium falcatum; Lycopodium sulcatum, usually called Lycopodium cæsium in gardens. *S.—Reader.* 1, Oncidium maculatum; 2, O. graminifolium; 3, Dendrobium Pierardi; 4, Justicia picta.

Rhododendron alta-clerense: *Old Sub.* Have you not lifted the wrong plant? We never heard of this Rhododendron varying so much in colour as to be "a good scarlet" one year and "pale pink" the next.‡

Rosa odorata: *H.* Your plant is probably too luxuriant to flower. Try what effect a slight root pruning has on it.‡

Pomegranate: *H.* Give it a little protection in spring if you can, so as to enable it to make its wood early, and thus get it better ripened before winter. You need not expect it to flower well, however, except after a roasting summer.‡

The Red Moon: *E B.* This, the Lune rousse of the French, is an expression indicating the presence of ground frosts at certain times when the moon shines brightly. The effect of cold, which scorches tender herbage, is imagined to be owing to the influence of the moon.

Woods and Forests: *J K.* The report of the surveyors who have inspected the forests may be obtained through the booksellers from the Parliamentary Paper Office. It is printed by Eyre and Spottiswoode, and is dated 1854. The cost is trifling.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PERUVIAN GUANO, of the finest description, on sale, from several Cargoes now due, without any restriction.—Apply to JOHN and THOMAS JOHNSON, 6, Walmer Buildings, Water Street, Liverpool.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, sec.
Office—40, Bridge Street, Blackfriars.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantiies not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; Mr. H. Campbell, 87, Dale Street, Glasgow; and from all the other Agents of the Company.

THE MANCHESTER SEWAGE GUANO COMPANY respectfully inform Agriculturists that they have made arrangements which will enable them to meet the increasing demand for their Manures. The MANCHESTER SEWAGE GUANO is a compost of Blood, Bones, Urine, Nightsoil, and other Animal Matters, and highly fertilising Chemical Ingredients, which are in a concentrated state incorporated with Animal and Vegetable Charcoal, ground to a fine powder, *the whole forming a dry portable Manure.* It is free from all kinds of Seeds, Weeds, &c., and enriches the land to a considerable degree for several years after it is used. Price 5l. 5s. per ton. Net cash on delivery. Testimonials forwarded on application. Carriage free to any Railway or Canal Wharf in Manchester.—JOHN THOMPSON, Secretary, 3, Watling Street, Shudehill, Manchester.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.
MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.
Canonmills Bridge, Edinburgh.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which RICHMOND AND CHANDLER have attained in the manufacture of Agricultural Implements; and the recent improvements made upon their various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated) are of the highest value in the economical preparation of food for cattle.—Address RICHMOND & CHANDLER, Salford, Manchester and South John Street, Liverpool. Catalogues gratis.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.
COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.
Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.
WARMING AND VENTILATING

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4s. 6d. each; Four Tine Forks, 5s. 6d. each. A liberal allowance on Wholesale Orders.
WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2½ „	long 3 „ 3 „		1 15 0
3 „	ditto 3 „ 6 „		2 12 0
3½ „	ditto 3 „ 6 „		2 18 0
4 „	ditto 3 „ 6 „		3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c, as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

NEW FEEDING SYSTEM.—NO OTHER MACHINE BUT KEALY'S PATENT PRIZE ROOT PULPER prepares the Turnip or Root for Lambs, Mash-feeding, or Fermented Food, which method is attended with an immense saving in time and money. Its exposition at the Cattle Show has created an unprecedented demand.
KEALY & Co., 369, Oxford Street, London.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address INGLIS & CHISHOLM, Charles Street, Garratt, Manchester.

FOWLER'S PATENT STEAM DRAINING PLOUGH may be seen in constant operation from this day until the 10th March, at WORMLEYBURY FARM, near Broxbourne, which is 40 minutes' ride from London by the Eastern Counties Railway. Gentlemen interested in Land Drainage are respectfully invited to make an early inspection of its operation. Thorough Drainage executed at from 3l. to 5l. per acre, including Pipes.
Apply to THOS. SCOTT, 5, Charing Cross, London; or to JOHN FOWLER, jun., Temple Gate, Bristol.—Feb. 24.

LAND DRAINAGE undertaken to any extent by Contract or Commission, to be executed by Hand or by Fowler's Patent Draining Plough.—Apply to THOS. SCOTT, Land Agent, 5, Charing Cross, London.—Feb. 24.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
John C. Cobbold, Esq., M.P. | William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S. | Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq. | Sir S. M. Peto, Bart.
Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.
Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.
SATURDAY, FEBRUARY 24, 1855.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	Feb. 28	—Agricultural Society of England.
MONDAY,	March 5	—Central Farmers' Club.
TUESDAY,	— 6	—Agricultural Imp. Soc of Ireland.
WEDNESDAY,	— 7	—Agricultural Society of England.

IN a recent Number when giving an account of MARLS and MARLING we endeavoured to inculcate the important lesson that while mere theories were often at variance with practical truth, yet that true science will ever be the best guide to correct practice. Our readers will recollect that in the article referred to, we endeavoured to show that 50 years ago the then best practical and scientific writers on agricultural matters advocated marl as almost, if not quite, the only manure that all crops required, but none at that time spoke of the principles (the science) of its action and none cared to acquaint himself with even the chemical constitution of the different kinds of marls employed; in fact, why marls should under any circumstances be useful as a food or manure for plants was not understood, and hence for years different kinds of marls were used, and now that we know that some contain alkalies and phosphates which are entirely absent in others, it is not to be wondered at that a marl from one locality may be of great use, while another from a different one may be worse than useless.

We have, then, in this case an instance of the assistance which the sciences of chemistry and geology may be made to afford in the practice of agriculture: the one informing us of the constitution of the marl, and thus pointing out to us whether or not it contains those ingredients which the same science has taught us plants require for their food and growth; the other enabling us to determine the geological position of the material analysed, so that we can at all times point out its presence or absence, and thus not expect valuable marls in such sterile formations as Wenlock shales, the blue lias, or the Oxford clay.

Nor is it alone in marls that the same scientific

principles will help us, for if we turn to an examination of *Stonebrash* (also a generic term with the farmer) we shall irresistibly be led to the same general conclusions.

How often it has been our lot, along the line of the Cotteswold hills, to hear a farmer congratulating himself that he has grown so many bushels of Wheat on "only a brash." Now, his neighbour, who has only been enabled to accomplish perhaps half this, is inclined to the belief that his successful friend has been only *lucky*, whilst he, on the other hand, claims his good fortune as the result of *better management*. Let these, therefore, pass as the conclusions of not very intelligent practical men, while we interrogate science upon the matter. The geologist tells us that stonebrashes are of several kinds, belonging to different formations, have been deposited at different ages of the world, are very diverse in mechanical structure, and include some few, and others many of very different fossil remains, and he can at a glance distinguish them wherever he may meet with them; is it, therefore, surprising that, with the differences enumerated, the chemist should find brashes from differing geological positions to vary in their chemical constituents? Now, to put this part of our argument in the clearest light, we have great pleasure in quoting the following analyses made by our friend Professor Voelcker, of the Royal Agricultural College, of brashes from three distinct rocks, to be presently more fully described:—

Table I.

Analyses of Stonebrashes by Professor A. Voelcker.

	1. Brash of Inferior oolite.	2. Brash Great oolite.	3. Cornbrash.
Carbonate of lime	89.20	95.346	89.195
Magnesia	.34	.739	.771
Iphate of lime	.09	.204	.241
Oxide of iron	...	...	...
Alumina	4.14	1.422	2.978
Phosphoric acid	.08	.124	.177
Soluble silica	2.75	1.016	1.231
Insoluble siliceous matter	3.27	.533	4.827
Alkaline salts	undetermined	undetermined.	undetermined.
	99.85	99.384	99.420

These three stonebrashes represent as nearly as may be a large tract of country which, occupying the middle of England, and rising more or less abruptly from the vales of Berkeley, Gloucester, and Evesham, forms the Cotteswold range of hills.

Of this range, about one-half is composed of the inferior oolite, which is, for the most part, but a poor sheep farming district. Towards Cirencester, or the more southern part of the Cotteswolds, the great oolite sets in, and there is at once a visible improvement in the land and an increase of produce; but even this improved state of things meets with still greater improvement south of Cirencester, where will be found here and there districts of limited extent, covered with cornbrash—the cornbrash of all the brashes being good natural corn lands, and hence the name—whilst the other brashes only yield corn that is, as it were, wrung from them with great labour and expense.

The great cause of expense is the obtaining manure, and much of the recent improvement which may everywhere be noticed may be traced to the extended use of bones, which have enabled the Cotteswold farmer to increase his Turnip crop.

Now inasmuch as bones consist of phosphoric acid and lime, a glance at the three analyses just quoted will show how one rock makes a soil naturally better than another, for No. 1 yields .07, No. 2 .124, and No. 3 .177 of phosphoric acid, the important element of bones. The plain conclusion, therefore, is that cornbrash affords the best corn-growing land because it has the most bones in it.

If we look to the average yield of grain for the three brashes here commented upon, we shall see the same facts illustrated in what may be termed the practical way. The following table represents the average of grain in bushels per acre:—

Table II.

Crop.	1. Stonebrash Inferior oolite.	2. Stonebrash Great oolite.	3. Cornbrash.
Wheat	15 to 20	20 to 25	25 to 30
Barley	25 to 30	30 to 35	40 to 45
Oats	25 to 30	35 to 40	45 to 50

This table illustrates facts and principles which will be readily understood by the cultivator of the soil, and we therefore now offer the landlord's touchstone of value in the following table, representing the average rent:—

III. Formation.	Rent the acre.
1. Stonebrash—inferior oolite	7*s.* to 20*s.*
2. Stonebrash—great oolite	14*s.* to 25*s.*
3. Cornbrash	20*s.* to 40*s.*

These facts tend to show that the reasons for practical results may be clearly made out by the scientific inquirer, and from these he is enabled to illustrate great principles, a right understanding of which would, as true knowledge always does, lead us to think more modestly of ourselves; for if we are fortunate enough to live in a district where everything looks prosperous, the crops good, and farmers rich and, consequently, as the term goes, respectable, we are not always to conclude that this has arisen altogether from our superior knowledge and intelligence; it may be only, after all, that *there are more bones in the soil.*

We direct attention to the remarks of the Hon. W. Napier upon those powers possessed by the Land Improvement Company, to which we referred last week. It appears that Mr. Bailey Denton's table, which we quoted, is wrong in one point and deficient in another; and in both particulars the requisite corrections will be found given in Mr. Napier's letter. Our own account of the mode in which this company acts is, it seems, liable to misconstruction; and therefore we repeat here, what will be found elsewhere, that the staff of superintending officers which the company employs in order to see that the money spent, which they repay, has been properly and efficiently invested, are not, except in this way, connected with the company. They are Government Inspectors appointed by the Inclosure Commissioners; and their official sanction is the security on which alone the company relies. This company acts simply as a bridge over which the floating capital in the money market may find its way to the land; and it has no permanent paid officer whose salary would merely increase the cost of the service which it renders, because without him the security of the company is perfectly ensured.

We have also to add in reference to the General Land Drainage Company, that it is a mistake to suppose that it only undertakes works superintended and undertaken by its own officers. It is willing to take all the responsibility of works executed by the tenant himself, or under his direction, when satisfied of the competency of the men employed.

The whole country has now for several weeks been locked up in frost; where fully exposed, the soil has been frozen to the full depth of its staple. There is every reason in this for congratulation. There is no implement of tillage like a good winter's frost, and all our fallow crops on which fertility for a course of years so much depends, will this year be easily and effectually cultivated. The land, too, has been pretty generally covered with snow, so that little injury of the young Wheat is to be anticipated. The dry autumn is a preservative against injury by frost rather in the case of perennials than in that of the plants which the farmer cultivates, but in the case of these, too, succulence of foliage renders frost more easily mischievous. We saw this week at Mr. Telfer's farm, near Ayr, the bulky succulent growth of Italian Rye-grass—the last effort of the plant before the winter of the past few weeks—lying dead, almost as white as bleached Flax. The leaf gorged with juice, as under his system of management it is, was killed at once. And this liability to injury prevails, no doubt, throughout, more generally on the western side of the island than upon its eastern shore. The moister climate has induced a more forward growth, which is more likely to be hurt—and unfortunately it is the eastern side of the island which is best covered in with the snow. Ayrshire and Lancashire are hardly white, while Berwickshire and counties south of it are deep in snow.

It is on our eastern side, however, that the principal Wheat-growing districts lie, and on the whole, as we have said, the present condition of the land and its history during the past few weeks are reasons for congratulation rather than alarm.

ECONOMY OF FOOD.

It is of the utmost importance to make a proper selection of such food as is best fitted to the age of the animal, remembering that the true principle of rearing young stock for the butcher is to give them such food daily as will daily increase their weight. The food which will promote the formation and growth of bone and muscles, should contain a large supply of the phosphates from which bone is formed, and gluten or fibrine by which muscles grow, such as Red Clover, Vetches, and other leguminous plants among our green crops, and Beans, Peas, oilcake, and Poppy-cake.

Linseed-cake contains of earthy phosphates ... 2.86 per cent.
Poppy-cake contains of phosphates ... ... 5.07 „

Thus Poppy-cake is of more value as food to young growing animals as it produces bone, as oilcake produces fat. When an animal has to take much exercise in gathering its food it consumes more of it to supply the waste of carbon; it breathes more frequently and more carbon is thrown off from its lungs; its food must therefore have more starch or sugar, for if more be not given the fat and other parts of its body must supply it—hence the less exercise the animal has, the less waste takes place.

In the box system of feeding, the animal rises to his food three or four times a day, then lies down to sleep the rest of his time, and being kept warm in the box the quantity of food to supply the waste is greatly diminished, and a large portion of it is left for the production of fat.

If an ox be fed on green Clover it is said that he will consume 150 lbs. daily and increase 14 lbs. weekly. The substances which produce this result, contained in the 150 lbs. of Clover, are as follows:—

	lbs.	Water.	Ashes.	Fibre.	Starch, Sugar.	Casein, Gluten.	Fatty and oily Matter.	Elements of Respiration.	Elements of Nutrition.
Clover	150	112.0	1.35	19.0	9.6	2.7	.22	28.6	3.0

The following is the composition of a winter food for a fatting ox upon another system:—

	lbs.	Water.	Ashes.	Fibre.	Starch, Sugar.	Casein, Gluten.	Fatty and oily Matters.	Elements of Respiration.	Elements of Nutrition.
Mangold	75	62.0	1.0	1.5	6.3	1.5	0.37	...	...
Oilcake	10	1.	0.72	1.0	4.0	2.0	0.1	...	...
Wheat straw	10	1.2	0.5	5.0	3.0	0.15	0.05	...	...
Oat straw	10	1.2	0.5	4.5	3.5	0.13	0. 7	...	...
	105	65.4	2.72	12.0	16.8	3.78	0.59	28.8	4.37

The following is an experiment by Mr. Hope, of Fenton Barns, on 18 oxen, and on this compound they increased 14 lbs weekly in weight:—

	lbs.	Water.	Ashes.	Fibre.	Starch, Sugar.	Casein, Gluten.	Fatty and oily Matters.	Elements of Respiration.	Elements of Nutrition.
Turnips	150	127.5	1.5	3.0	14.25	3.0	1.0	17.25	3.0
Potatoes	10	7.4	0.1	0.4	1.8	0.2	0.0	2.2	0.3
Hay	5	0.7	0.4	1.5	2.0	0.3	0.1	3.5	0.4
	165	135.6	2.0	5.0	18.0	3.5	1.1	23.0	4.4

The following is the composition of food for fattening cattle which I have used for years:—

	lbs.	Water.	Ashes.	Fibre.	Starch, Sugar.	Casein, Gluten.	Fatty and oily Matters.	Elements of Respiration.	Elements of Nutrition.
Swedish Turnips	100	85.0	1.0	2.0	9.0	2.0	0.5	11.0	25
Bean-meal	5	0.7	0.01	0.5	2.2	1.3	0.1	2.7	1.4
Linseed-meal	3	0.0	0.01	1.5	0.6	0.6	0.5	2.1	1.1
Straw	12	1.5	0.7	5.5	4.5	0.1	0.1	10.0	0.2
Water	10	10.	...	...	...	...	...	...	...
	130	97.2	1.72	9.5	16.3	4.0	1.2	25.8	5.2

The following is the account of an experiment made by me on the feeding of sheep, which shows the effect of shelter, of quiet, and the absence of light upon the quantity of food eaten, and of the mutton produced from it. Five lots of five sheep, each lot of nearly the same weights, were fed each with a pound of Oats a-day, and as much Swedes as each lot choose to eat. Lot 1 of 5 sheep was folded in a pen made with hurdles in the open air, close by the yards, and littered with straw. Lot 2 of 5 sheep were in one pen under a shed, so that they had light but no rain came to them. Lot 3 of 5 sheep were under the same shed, but each of them was confined in a space so narrow that they could not turn round in. Lot 4 of 5 sheep were confined in a close house, in one pen, but all was dark and warm; they had the same size of a pen as lot 1 and lot 2. Lot 5 of 5 sheep was confined in the same house as lot 4, but each of them was confined in a crib, the same as lot 3. The increase of live weight in each of the individuals of the five lots, and the average quantity of food which each respectively consumed appear in the following table:—

	Average live weight of each individual.		Average increase of each sheep.	Average Turnips eaten by each sheep.	Increase for each 100 lbs. of Turnips
	Nov. 18. lbs.	March 9. lbs.	lbs.	lbs.	lbs.
Lot 1, unsheltered	108	131.7	23.8	1912	1.2
Lot 2, in open sheds	102	129.8	27.8	1394	2.0
Lot 3, ditto in cribs	108	130.2	22.2	1238	1.8
Lot 4, in a close dark shed	104	132.4	28.4	886	3.1
Lot 5, ditto, each in a crib	111	131.3	20.3	886	2.4

From this table we find that one-third less Swedes were eaten by the animals which were in the pen under the shed than by the lot which was in the open air, while in live weight they gained 4 lbs. more each.

That those in the dark, however, did not consume half the quantity of Turnips, while they increased 5 lbs. more each.

The animals which were confined solitary in the house cribs were fretful and restless in this confinement, which retarded the fattening process; therefore the most profitable way of feeding animals is to keep them in a dry warm place, and in as dark a place as you can command. *J. M.*

THE DRAINAGE COMPANIES.

With reference to the able and impartial leading article in the *Gardeners' Chronicle* of Saturday last, reviewing the parliamentary powers and the *modus operandi* of each of the companies incorporated for the purposes of lands improvement, will you permit me to

point out an error in the tabular statement of Mr. Bailey Denton, which if not corrected may be injurious to one of the companies in question.

I allude to that part of the table respecting the Lands' Improvement Company, where the rate of rent-charge to repay a loan, principal and interest, in 25 years, is stated at from a minimum of 6*l.* 10*s.* 8*d.* to a maximum of 7*l.* 1*s.* It should have stood thus—"Minimum 6*l.* 10*s.* 8*d.* and maximum 7*l.* 1*s.*; according to the rate of interest in the money market at the date of the contract."

It is likewise stated in the table that only three-fourths of the cost of "clearing" lands may be charged on the lands improved, whereas the company's act permits the *entire* cost to be charged.

Again in the editorial comment there is a mistake, which I may, perhaps, be permitted to rectify. It is observed, "The Lands' Improvement Company again, although it employs a staff of superintending officers," &c. As this, sir, might naturally be interpreted to mean that the company employ a staff of officers, or surveyors who have the supervision of the improvement works executed by landowners by means of the company's powers, it is right to explain that the company do not employ any such officers.

The Inclosure Commissioners for England and Wales, whose jurisdiction extends also into Scotland, appoint one of the Government Inspectors to report, in the first instance, as to the increased annual value to be effected by the proposed outlay; further, occasionally to inspect the improvements while in progress, under the landowner's own agents; and lastly, to report whether the works have been duly executed with good materials and workmanship, and according to the plan, specification, and estimate previously authorised by the Commissioners.

This company having decided, as was lately and most admirably set forth in your columns, to act simply as a bridge over which the floating capital in the money market seeking investment may be passed for the purposes of lands improvement; and considering that Parliament had vested the highly important trust as regards the efficiency of the improvements in the hands of the Government Inclosure Commissioners; and that the gentlemen holding the position of "assistant commissioners" had become well known to the country under the Government drainage acts, and entitled to complete confidence as eminently practical and scientific agriculturists and engineers;—the directors of the company, after long and serious consideration, determined that it would be vexatious to charge the works with the costs of any further supervision, and which could not, according to the evidence before them, lead to any possible advantage to the landowner or to the lands charged. *William Napier, Lands Improvement Company, 2, Old Palace Yard, Westminster, Feb. 20.*

ON FALLOWS WITH GRAIN.

One might well suppose that the promulgation of such a plan of Wheat production as that set forth by the incumbent of Lois-Weedon, and sustained by such sound reasoning, would not only have produced innumerable imitators, but a revolution in all our systems of tillage, in all our field management, that at least it would have set every one a thinking, even down to those least accustomed to this exercise of their mental faculties. But there is much that stands in the way of rational progress in agriculture and, perhaps, in nothing more than the want of a just appreciation of the advantages and effects of fallowing; yet Mr. Smith has pointed all these out sufficiently for practical purposes.

Through drainage and with the aid of manures, especially artificial ones, cropped fallows have now very generally superseded in Great Britain the worked naked fallows, once so general. In Ireland, I believe I may almost say from time immemorial, the naked worked fallow has been and is still but little practised, the chief dependence for the renovation of land being on the unproductive, unworked fallow, that is, in the land being left uncultivated to riot in all the wasteful (properly termed waste by the Irish) luxuriance of the weeds of many years accumulation, trusting entirely to slow, unassisted, natural disintegration of the soil, and to such limited absorption of the fertilising influences of the air as a hardened and repellent surface would admit for the future fertilisation of the land. The only fallow crop, with very few exceptions, has been, and will be again, the Potato crop,—possibly, however, a more efficient one in the way it has been tilled, than has been supposed—the despised and affectedly contemned lazy bed—by which successive surfaces have been exposed to atmospheric influences to the full depth of, at least, the surface soil, while strips of the subsoil have been exposed for several months to direct atmospheric action, drinking in at the same time the drainage of the beds, and drawing from them their surplus water.

There is a simple fact established by the Lois-Weedon system, that—for an average production of cereals during, we may say, an unlimited number of years—a good and perfect tillage (fallowing) of the land is all sufficient; of Wheat in proper Wheat soils, and, without doubt, of other cereals in other soils adapted to them. And these are said to be our exhausting crops. Does not this simple fact very clearly indicate that much of the heavy expenses in the tillage of green crops, and in the outlay on artificial manures for their production may be saved, and, indeed, make it probable that the manure raised on the farm and by the farm produce alone may be enough to maintain the land in a high state of fertility? No system of farming is perfect, or can become general that requires the robbing of one farm or one territory to maintain a high fertility in another. In order to constitute a general system, each farm must be self-supporting. For if this more perfect tillage so cleans, disintegrates, and fertilises the soil as to fit it, after Wheat, to produce an average crop of Wheat on the succeeding year, will it not fit it to produce a green or root crop with much less of tillage and manure than is now applied?

Were we to follow out the system of Tull in its integrity—were our grain crops fallow crops as well as our green and root ones—could we question that the fertility produced in the soil by continuous natural causes would, with our ordinary supplies of farm-yard manure, give us as good crops as we now obtain at very great cost?

We have adopted Tull's views in the tillage of root and green crops—why have we refused to adopt them in our cereal ones? Simply because they were not so obvious. In the spreading tops of those plants we saw a necessity for allowing them room to expand; this was plain to the physical vision, the mental one we did not employ, and we forgot to search beneath the soil, where we might have found the roots of the latter demanding as large a field for the collection of their food as the former; and yet we call them exhausting crops, and say, from the size of their leaves, they are more severe on the ground. Is it so? When we contemplated the upright growth, the narrow unexpanded leaves of our cereals, we never gave a thought that they might, for the indrawing of their proper aerial food, require as wide an expanse as the more spreading leaves of our green crops. We did not consider that in their more lofty growth the air was more likely to stagnate in their close proximity than when it swept over the lower growing plants.

Can we wonder that under the Norfolk system the land should become Clover sick?—one twelvemonth of fallow in four years; from the sowing of the Barley crop to the ploughing up of the Clover for Wheat, an untouched induration of the soil, a light single ploughing, and then 12 months more of induration. During the Barley summer the surface is baked, and its interstices choked up by the finer particles of the soil; the dews and light rains that fall on it cannot enter it, but return again to the heavens from whence they fell. So, in a great degree, is the case in the Clover year. No one supposes that the dews which lie on its leaves in the morning, or the light showers that rest on them, are absorbed by the soil; even the portion of them that may be drunk in by the leaves of the plants soon again perspires and is lost in the air. The same events even more fully occur in the Wheat year. The surface has been right well puddled by the winter rains—what, then, has been the atmospheric inflow? What has been its action on the collapsed soil and its mineral contents? The wonder is, not that the land should become Clover sick, but that it should not be sick of everything but repletion. Preserving the evil, an improvement is proposed in extending the course; a better one would be to make the two grain crops fallow ones, and sowing the Clover on the Barley after a second hoeing—there would then be a fallow, either a worked one or a green one, every year.

An obstacle to the more general acceptation of the Lois-Weedon system lies in the novelty of its mode of operation, and in its requiring other implements than those in general use; the difficulties may be more apparent than real, but they shove people too much out of their old ways. These difficulties, however, may be easily got rid of altogether by applying to our fallow grain crops, with the implements in common use, a tillage precisely similar to that of our fallow green crops, laying, like them, our grain rows at equal hoeing distances; and, except for the purpose of admitting stolen crops in the wider intervals, I look upon those equally distant rows as preferable for fallow purposes to those of Lois-Weedon. The atmospheric action on the soil is equally effectual, the deep working of the soil equally practicable, the after-working as easy, while the food (both aerial and mineral) is more equally supplied to both sides of the plants, and again the preparation for a future crop is just as perfect.

The lands may be sown by a common corn drill as usual, suspending the actions of the intermediate deliverers, or drills may be opened (say 2 feet apart) with a double mould-board plough, and the seed dropped in by a barrow-drill, and covered by a harrow. When the rows appear, if not prepared then to dig, hand-hoe and dig where it is proposed to be done afterwards; I consider the stirring of the soil immediately after the appearance of the germs above ground as very desirable, to admit air to the roots of the young plants at the moment when, having exhausted the pabulum contained in the seed, they become so much more dependent on the soil. The after stirrings may be made by any of the usual drill-hoeing implements. The last operation should be with the double mould-board plough, drawn by one horse, to lay the earth neatly against the rows, with the view of supporting them and rendering them less liable to lodge. This will also leave a furrow for the succeeding sowing, which may be cleaned out after the reaping, and sown without more ado; and the seed covered with a cross harrowing, the stubbles dug or cut up with a skeleton plough towards Christmas, the rows having been previously hand-hoed. In this way the fallowing, as well as the succession of grain crops, will be as easy and as inexpensive, if not more so, than green crops. *J. M. Goodiff.*

Home Correspondence.

Pigeons.—From some notice which appeared in your columns I am induced to address you. I have some laughing pigeons, and besides the novel cry they make they possess merits of great importance, for as breeders they surpass all other kinds I ever kept, and may be called the Hamburghs or everlasting layers among pigeons. As a friend of mine remarked, he never saw any birds like them for laying, and they are the best of nurses. They will sit on three eggs, hatch, and rear them. Four young ones I find are too many for two pigeons to rear, and what surprises sundry friends is that during all this cold weather they have been breeding and have reared their young, as I have now a pair all feathered and another pair next to just commencing being feathered. This I think is something in their favour, and I am sure that your readers who are pigeon fanciers would, like me, if they only knew them, be glad to keep them. I also find that as soon as they see any light they immediately begin to cry, thus making them as good as a dog. *An Old Subscriber, Durham.*

Bricked Arches v. *Tiled Roofs.*—A "Northern Subscriber" will find roofs of common brick arched and made waterproof to be cheaper and more durable than timber and slate for buildings not requiring a loft. They must of course have proper ties and ventilation. They have been largely adopted by E. W. Wilmot, Esq., of Congleton, who will be very glad to show his and furnish plans, &c., if wished for. The saving in cost is, he tells me, about 25 per cent. I shall certainly adopt the plan here for any new sheds I may require. *C. P. S.* [In reference to this we have received the following:—It is quite impossible without further information to compare the cost of a brick with that of a slate or iron roof. Your correspondent does not mention the span, nor whether the roof is half brick, whole brick, or brick and a half thick. He says it requires ties, but of what kind or how applied there is no mention made, nor does he say what the abutments consist of. Lastly, there is no description of the manner in which it is made waterproof. I have used half brick arches for floors. The arches are 16 feet span, and abut upon iron girders tied together by wrought iron rods. The haunches are made up level with brick bats and broken stones, and the floor is formed of asphalte. They stand well. If your correspondent means arches such as these, I dare say their cost where bricks and labour are cheap may be somewhat under that of a good timber and slate roof, but the latter is infinitely preferable in regard to lightness and durability. *J. N.*]——A "Northern Subscriber," who inquires about a better kind of roofing than at present used, will find, I fancy, a very useful proposal in what is suggested by Mr. James Barrett, Assoc. Inst. C.E., on Fire proof Buildings, 1853. It is flat, with iron or wood girders, and particularly suitable for farming buildings. It is far superior to the flat brick work and very cheap.——When speaking of timber trimming and general foresting—an employment I am very fond of—I merely wish to offer one remark. Taking by observation and experience that it is always wrong to cut off a large member from a tree, yet sometimes it must be done. When it is required, I like the plan of cutting the arm (exactly into its kind of collar) first on one side and then on the other, rectangular to the earth, so as to form a wedge-shaped end to the cut off arm, leaving a kind of sunk double cut on the tree, thereby enabling the bark more quickly to gather together and unite over the wound. In small trees, which alone should be trimmed—*i. e.*, from 1 inch to 2 inches—I find it an excellent plan. *Constant Reader, Norfolk.*

Ploughing in Snow.—Do this on heavy clay land, and you will render your soil so unmanageable that you will have no chance of "a season." Such is the doctrine in the locality of Sussex and Surrey, founded upon the result of the experience of the last generation, so that the present never dare to try the experiment. Is it founded on fact, or not? because it is not easy to comprehend why snow should, during the process of a thaw, render the soil more adhesive when the thaw is underground than when above. Gardeners are equally fearful. Trench in snow, and you will never grow anything all the summer: so that the clay lands are inevitably behindhand. Spring will probably steal upon winter with fine bright sunshiny days and bitterly cold nights. Snow may remain on the ground till April. All this time the plough and the trenching fork are to be idle, and the labourer out of employ. If the Lois-Weedon system or any other can satisfy the farmer that this is a mere antiquated notion, let it explode it at once. *Simplex.*

Draining.—If not taking up too much space in your columns may I be allowed to submit the following drainage question for your own and your correspondents' opinions? The land to be drained is a very flat valley about 2½ feet higher than a brook running through it, and this is the only outlet, so that the drains over the greater part of it cannot be put deeper 30 inches. Both on the north and south sides the ground rises considerably (belonging to other proprietors) especially on the south side; the extreme south end of the drains can be thus laid five feet deep. The land is now in Grass or I might rather say in Rushes. I have drained about one acre of it 2½ feet deep, and 16 feet apart, but have stopped further operations in consequence of having had

holes dug in different parts, some 6, some 7, and some 8 feet deep. In the lowest part a hole dug 6 feet deep shows the subsoil to be a very hungry blue slatey marl (it is in the Weald of Sussex), and at 5½ feet there is mixed with this a great quantity of decaying timber, there being quite a layer filled with it, as though a quantity of earth had been at some time washed or driven over a young forest—the wood being very small, the largest being about as large as a man's arm. Upon digging to the depth of 6 feet you come suddenly to a bed of gravel exactly resembling the bottom of the brooks in the district. Upon reaching this—but not till then—the water rises very fast, and in the course of six hours the hole, 6 feet across at top, and 2 at bottom, was full up to within 3 inches of the top of the ground; where the ground rises in the field, the holes upon being sunk deeper in proportion to the rise, there appears the same bed of gravel and the same subsoil as before, no water being seen until the gravel is reached: in a hole 8 feet deep the water did not rise so fast, but yet the hole was soon filled. Now what I wish to know is, whether drains 2½ feet deep and 16 feet apart, will be likely to effect a complete draining of such land (the upper soil is a stiff loam); if not would it be of any use to have an upright drain from the bed of gravel mentioned, to communicate with the 2½ feet drains. Suppose a shaft sunk in every third drain in the lowest part of the field throughout, would the water from the gravel bed rise up these shafts (and so pass off in the drains) as it does in the holes. Will not the land be wet until this bed of water is removed? I have had no means of testing the use of the draining done, as it was only finished just before this frost set in. I shall feel very much obliged for any information with which you or your correspondents would favour me upon this question. *Leasurely.* [You say that a maximum of 30 in. deep is a necessity laid upon you. Then you must make the best of your case at that depth. The policy of letting off the water from below depends upon the character of the clay. Unless it be a remarkably stiff clay we should be inclined to bore to the gravel, and connect the bore with one of the drains.]

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Weekly Council, *Feb.* 21.—Mr. Miles, M.P., President, in the chair.

Oil for Machinery.—Mr. Brotherton, of Wandsworth, called the attention of the Council to the economy and value of Rape oil, as a substitute for Olive oil, for the purpose of lubricating the moveable parts of machinery; and to the consequent importance of the cultivation of Rape in this country as an agricultural crop.—Prof. Way suspected that the sulphur contained in the seeds of that plant might have an injurious effect on the metallic surfaces under friction to which the oil was applied.—Dr. Calvert had understood that some of the animal oils had been employed with success for the purpose stated by Mr. Brotherton.—Colonel Challoner referred to the freezing process practised by the Geneva watchmakers, by which the solid and impure matters of vegetable oil were separated from the pure oil which resisted the effect of cold even at very low temperatures, and which was accordingly highly valued by them for the delicate purposes of their watch machinery.—Prof. Way referred to the separation of paraffine in the distillation of coal-tar, and to the separation of solid stearine from vegetable oils, and the thin oily matter left behind in a liquid state. The great object was to obtain a pure oil least subject to oxidation by friction.—Mr. Girdwood thought that the difference in price between Rape-oil and sperm-oil was so great that any successful substitution of the former for the latter was well worth attention.

Planting of Grain.—Messrs. Hardy and Son, of Maldon, transmitted a tabulated statement of their experience in the sowing of Wheat and other grain, with the following conclusion deduced by themselves:—

"We are fully persuaded, from repeated experiments, that the greatest possible amount of grain can only be attained from the standard of 1 foot apart square, from plant to plant; and that the surest and best plan to effect that object is by sowing it early, and transplanting it in autumn."

Nitrates.—The Board of Agriculture at Berlin applied, through the Prussian Consul-General in London, for detailed information on the locality, occurrence, preparation, freight, price in comparison with other manures, probability of reduction in price, and other facts connected with the commercial value and agricultural use of the Nitrates of Soda and Potash; requesting the favour of the Council's transmitting to the Board those volumes of the Journal of the Society containing information on the subject.—The Council ordered the Journals to be presented to the Board as requested, and an intimation to be given of the sources of commercial information referring to the nitrates; but the President regretted that until the present investigations so kindly undertaken for the Society by the Earl of Clarendon were completed, the detailed information required by the Prussian Board of Agriculture could not be supplied in a complete state. At the previous meeting, Mr. Caird alluded to the bar-harbour at Tampico, as *not* being an insurmountable obstacle to the exports of the nitrates from that place. In our report of that meeting, the negative was unfortunately omitted, and a different character, consequently, given to his remark—a correction which we are glad to avail ourselves of this opportunity of rectifying. Mr. Cair had been informed, by an officer who had surveyed the harbours of Archangel, Revel, and Riga, that those harbours were likewise bar-harbours, with not a greater depth of water than that of Tampico, namely, 9 feet; and that large ships were constantly loaded there out-side by the aid of lighters drawn out by steam-tugs. The President having summoned the special committee on Guano and Nitrate Supply to meet on the day of the next Monthly Council, that question and others connected with the subject generally had been referred to that committee for consideration.—The President gave notice, that at the next meeting, Mr. Jonathan Gray's model of a great improvement in the construction of shedding (on the span-tension and tent principle), both for implements and cattle, would be exhibited to the members.—Mr. Scott, of 5, Charing Cross, transmitted information on Fowler's Steam-draining Plough, with a statement that the present weather had not been found in the slightest degree to interrupt the operation of that plough.—The Bavarian Agricultural Society transmitted an account of their latest proceedings.—Mr. Cox, of 68, New Bond Street, presented a copy of his "Landlords' and Tenants' Guide."

Adjourned to Wednesday, Feb. 28th, at 12 o'clock.

Farmers' Clubs.

Botley and South Hants.—*On Agricultural Leases.*—Mr. Gale, County Court Judge, delivered an address on this subject at the meeting of this Club recently, from which we make the following extracts:—

"It has, indeed, been said that there are many instances in which, for one or more centuries, the same family have tilled particular land, without a lease; but, I believe, the answer has been truly given, that those instances often present examples of as bad farming as any to be found in England. Supposing, however, that the high character of a landlord may be a sufficient security that he will deal fairly by his tenants, who can guarantee the latter against the conduct of the successor to the estate, who may be a grinding man, or, from his extravagance or other causes, may think proper to sell it? I could advance, were it necessary, instances of the truth of this: but I think I may assume that no man in his senses would invest his capital in the land of another without the protection of a lease. There is a matter bearing on this subject which I desire to allude to, only to prevent any misconception of our views upon it. I mean Tenant-right. As it is demanded in Ireland, I understand it to mean a right to call upon a landlord, at the expiration of a tenancy, for compensation to the tenant for such improvements as he may have made upon the land, the effect of which is wholly or partially exhausted. This is sought for, not by a provision introduced in the demise, by the consent of both parties, to which it is obvious there could be no objection, but by the forcible interference of the legislature altering the effect of the contract they have entered into. I hope I express the general sense of the farmers of England in utterly repudiating such a doctrine, which tends manifestly to the subversion of the rights of property. If the legislature were to do this, it would be impossible to say where it would stop. Many Utopians might, with just as much reason, urge that it should fix the price of labour, or of bread, or of the course of cultivation, or, in fact, anything which benevolent but irreflective persons might think would conduce to the general good. If a proprietor wished to sell his land, no one would contend that the legislature should dictate the terms of sale, any more than if he had a load of Wheat to sell; and, if so, with what colour of justice can it fix the conditions on which he should let the possession and use of it to a tenant, which is in fact nothing more than selling to the tenant a partial interest in the land. The objects to be sought for in a lease are, security to the landlord and freedom of action to the tenant. The landlord seeks to secure himself by prescribing in the lease the course of cultivation to be followed either in express terms, or by compelling the tenant to follow the custom of the country, either by express allusion to it, or by calling in aid the law which commonly binds the tenant to observe it, on points upon which the lease is silent. I have the authority of a practical man of very large experience, Mr. Robert Stares, of Droxford, for saying that numerous existing leases prescribe a course of cultivation which is simply absurd. By a tacit consent these are commonly disregarded, and the consequence is that the tenant would be better off without a lease at all, as such a lease puts him at all times at the mercy of the landlord, and indeed is of no use but to put a fee into an attorney's pocket for copying upon stamped paper, or parchment, a senseless document originally prepared in the dark ages of agriculture. Usually a lease contains a clause of forfeiture for breach of covenant. The landlord in such case might bring an action to recover damages for the breach of covenant, and also an action of ejectment to recover possession of the land. The fear of the consequences of such actions might have an effect upon a good and respectable tenant, and induce him to observe the terms of the lease; but it is the case of the dishonest tenant that we have principally to do with, and he it is whom it is necessary to bind, if possible, by the firm hand of the law. The landlord commences his actions; the damages and costs ruin the defendant, and he usually pays them by passing through the Insolvent Court. This is so well known, that few landlords appeal to the law, because they do not wish to purchase, at a great price, a barren verdict. There was a case in this neighbourhood where a farmer, after holding a farm a year or two, which were not very good ones, would neither pay rent, cultivate, or give up possession. Possession was ultimately obtained from him by a compromise, and the land was then in such a state that the landlord was obliged to cultivate it himself at a heavy loss, to get it into a lettable condition. Such instances are numerous. I think it tolerably clear that at present a lease gives to the landlord but little security; let us now see how the tenant is affected by the covenant. His numerous advisers are perpetually urging him to spend more money, to exert himself vigorously to effect improvement, while he is bound by the conditions of his tenancy to follow a particular course of cultivation. This seems to me to be about as reasonable as to put a man in fetters, and then invite him to run a race. It seems to me that nothing can be a greater bar to improvement than binding any tenant to the same course of cultivation, whatever his style of agriculture may be—the man who sells everything off his land that his covenants will permit, who keeps little or no stock, and the man who expends a large amount of capital in artificial manure, or in supporting a large live stock. These routine covenants set nature at defiance. We all know how the seasons vary, and yet wet or dry, hot or cold, the farmer must take the same course. It thus becomes so difficult to observe the conditions of a holding, that probably few farmers have not sometimes deviated from them, and thus nullified their leases. They know that they have done, or probably may do so, and thus the sense of security of tenure, without which improvement is discouraged, is lost. To provide a remedy for this state of things some assistance from the legislature must be invoked. I suggest that the tenant should be left quite free to cultivate as he pleases during the whole term, except the last year, or perhaps the last two years. The only covenant should be that the land should be kept in a state of good cultivation, and proper tenantable condition. For the security of the landlord it should be provided that if the land be not so kept, he should have a right to institute a suit for damages, and also to recover immediate possession of the land. But as the present remedies at law are too expensive and not sufficiently expeditious to prevent the mischief of bad farming, a cheaper and prompter tribunal must be provided than the Courts at Westminster, with their spring and summer assizes, can give. I am afraid the only tribunal in existence that can be appealed to is the County Court. It cannot be expected that the judges of these courts should be practically acquainted with agriculture; they should be, therefore, at liberty to take the assistance of some practical man, who might aid them, as the Trinity-house brethren now do the judges of the Admiralty Courts. It should be the duty of such practical man to sit with the judge when hearing the evidence, and also himself to view over the land in question. The court should have power to award damages and immediate possession. It should also have power in assessing the damages to take into consideration any tillage that a successor to the land would have the benefit of, and also an equitable power to suspend the judgment for possession if the defendant could show a reasonable probability of his being able in a moderate time, by manure or otherwise, to restore the land to its proper fertile condition. The tenant should be bound during the last year, or perhaps two, of his lease to leave the land in certain crops, *ex. gr.* in the four course, otherwise, in case the lease was not renewed, the successor would be in a difficulty. It may be objected that the powers proposed to be given would be too large and arbitrary. With regard to one point, *i. e.* to claim for damages, there would be no more power given than an arbitrator has at present, but the remedy would be cheaper and more expeditious. With regard to the power of giving possession, though it may appear dangerous that the landlord should have a right to it, for the breach of a covenant which cannot give the required freedom to a tenant without being vague in its terms, I think a good tenant would have nothing to fear, and I cannot think it likely that the landlord would or could safely dispense with such a protection if he abstained from all dictation as to the course of cropping. To remove every objection on this score, it might be required that in order to give the plenary jurisdiction suggested, it should be necessary that the lease should contain a provision by which both parties should agree to submit to it."

Reviews.

A Diary for the Poultry-yard, Dairy and Piggery, for 1855. By an Essex Amateur. *Essex Gazette* office, Colchester.

This seems just the thing for which we are often asked. It contains a calendar in which to enter when fowls and pigs and cows should bring forth; pages for recording the eggs laid and sold; and corresponding diaries for the other items of poultry and of dairy produce. It seems to present the complete and useful diary which it professes to be, and which numbers now-a-days are asking for.

Hints on Fishing and Shooting, by C. Idle, Esq., Longmans.

Horses and Hounds, by Scrutator. Routledge.

These volumes contain full and detailed instructions, illustrations, and general and particular disquisitions on their respective subjects. Mr. Idle seems to be an agreeable and sociable companion, as intelligent men of his name generally are: and "Scrutator" is as full of anecdote in reference to his subject as any veteran in another field when discussing his feats in the past.

Fourteenth Annual Report and Transactions of the Royal Society for the Promotion and Improvement of the Growth of Flax in Ireland. Belfast.

We refer to this pamphlet containing the history for the year of a most useful Society, merely for the purpose of extracting from it the account by Mr. Andrews, of Comber, of the cultivation of a small farm which he had cultivated as a model for landholders—Flax being introduced as one item of its rotation. It is proper to explain that the Cunningham acre contains 6250 square yards, 10 Cunningham acres being nearly 13 acres imperial.

"The leading object being to keep the largest possible stock of black cattle and swine, Flax, before its independent value had been ascertained, was introduced very much because, from the early period at which it is taken from the ground, it affords the facility for sowing Rape for spring feeding. The Flax being pulled in the end of July, or very early in August, the one-half of the ground which had been occupied by it is moderately manured and sown broadcast with Rape in two or three divisions from the earliest period possible in August to the 1st of September. Such Rape comes into use soon after the middle of April, and affords an abundant supply of food for cows till about the 21st of May, when the first cutting of Clover is ready for use. The ground which has been so occupied by Rape is sown with spring Vetches late in the month of May, from which in the end of September and during October, when the second crop of Clover is exhausted, a supply of fine succulent herbage is most opportunely afforded. The other half of the Flax ground is, about the 1st of October, sown with winter Vetches mixed with a little Rye. These Vetches, by the 20th June, when the first crop of Clover has been consumed, have attained considerable strength and firmness, and supply the cows with excellent food till nearly the 1st August, when the second crop of Clover is ready. It continues in use till far on in September, when, as before stated, the spring-sown Vetches is succeed. The ground yielding the winter Vetches is prepared and manured for transplanted Swedes, fine strong plants of which, in the end of July and beginning of August, are taken from the drills in which twice the number of plants which is required for the crop have been permitted to remain, in order that alternate plants may thus be removed; and such plants having formed bulbs of the size of small eggs, and with largely developed leaves, are never found to fail, even though transplanted in a dry season, if the manure is placed in the drills in a moist state. The Swedes so transplanted continue to grow during the winter till checked by severe frost, and afford a valuable addition to the root crops for winter use. It will thus be seen that from the portion occupied by Flax, owing to its early separation

from the ground, facility is afforded for raising two green crops of distinct varieties in the succeeding year, and by no other means could such an advantage be so satisfactorily secured. Here, then, is a great benefit indirectly resulting from Flax culture.

"The rotation of the small farm, consisting of 10 Cunningham acres, of which I have been speaking, is so arranged that exactly one-half is devoted to the raising of cattle food, and one-half to cereal crops, Flax, and Potatoes—the latter, since that crop became so precarious, occupying only a twenty-second part of the whole. The farm is dispersed in 11 divisions, one of which is in permanent pasture, being enclosed separately by a fence, all internal fences having been removed from the remainder of the farm. The green crops for cattle food include Clover and Italian Rye-grass, Vetches, Beans, Turnips, Mangolds, and Cabbages. The succession of feeding, of which a fresh supply is provided for every month of the year, commences in spring, soon after the middle of April, with Rape; from about the 20th May, till the 20th June, Clover and Italian Rye-grass; thence till about the 1st August, winter Vetches; from the 1st August till late in September, second growth of Clover; in October and beginning of November, some Cabbages, Mangold Wurzel leaves, mixed with dry old straw, to correct their succulence, and a portion of Clover and Rye-grass of third growth. During the summer each cow is also allowed 2 lbs. of Bean-meal daily on her drink. I have never been obliged to resort to my root crops till about the 12th November, from which date till the return of the season for Rape in Spring, Turnips with chaff and cut straw, and such portions of hay from the first growth of Clover and Italian Rye-grass as could be spared, enriched with Bean-meal, boiled into gruel with distiller's wash, form the winter food. The greater part of the Mangold Wurzel is reserved for pigs, which are found to thrive much better on it than on Turnips. The pigs receive besides a little buttermilk and the refuse of the house, and some Bean-meal; and the Mangold Wurzel is available for them till August in the succeeding year, when early Cabbages come into use, and after them a succession of Drumhead Cabbages provides for the pigs till the middle of November, when the Mangolds are again ready.

"In the rotation, the white and green crops alternate, and the large number of cattle fed constantly in the house, except during two or three hours daily in summer, when they are admitted to the small pasture field, afford manure sufficient to give light dressings to the green crops in each alternate year. The stock of cattle, including an ox for draught, is never less, and is sometimes more than four in summer and six in winter, and the number of pigs is three on the average. The milch cows, highly fed as described, being kept for the supply of the family, are credited to the farm at 10*l.* each per annum, being certainly less than they would yield if their produce were sold; and the result of accounts of the farm, of 10 Cunningham acres, which are accurately kept, exhibited in the year ending 30th September, 1852, a gross product of 114*l.* 11*s.* 10*d.*, and a net profit of 43*l.* 5*s.* 6*d.*, the rent charges being at 2*l.* per Cunningham acre, and the sum paid for wages 33*l.* 11*s.* 6*d.*, and in the year ending 30th September, 1853, a gross produce of 128*l.* 6*s.* 4*d.*, and a net profit of 56*l.* 2*s.* 3*d.*, the rent at 2*l.* per acre, and the amount of wages, 34*l.* 6*s.* 3*d.*"

The balance-sheet of each year is appended to this statement:—

To this very satisfactory result Flax culture has directly, as well as indirectly contributed. The sum received for the produce of 3A. 23P. Cunningham measure of Flax, in the first year was for Flax, 5 cwt. 3 qrs. 2 lbs., at 52*s.* 6*d* per lb.	£15	2	8
For seed 10 1-16 bushels	5	1	0
	£20	4	2
From which, deducting 7*l.*, the estimated cost of an acre, including rent, taxes, seed, manure, and labour in all stages, the balance, 13*l.* 4*s.* 2*d.*, forms a handsome item in the profit account.			
In the second year the produce was:—			
Flax, 5 cwt. 3 qrs. 12 lbs., at 65*s.* 4*d.* per cwt.	£19	2	8
Seed, 10¾ bushels, at 12*s.* per bushel	6	9	0
	£25	11	8
Deducting	7	0	0
Nett profit	18	11	8

"The crop in both years was treated on the Courtrai system, winning and stacking it till the following spring, when the seed was taken off and sold for sowing, and the straw watered during the summer. I am not prepared to offer a decided opinion whether that mode of treatment will, on the whole, be found most profitable. If home-saved seed should continue in demand for sowing, I am satisfied it would be so, as the gain by the seed is so important an item. If a prejudice against home saved seed which has been encouraged in the present year, contrary to the experience of the writer, shall prevail, it is probable that more profit would result from rippling of the seed, and watering the straw immediately, as there can be no doubt that a finer fibre is thereby secured than can be obtained by any process yet known to us in connexion with winning and stacking. By one process or the other the seed should unquestionably be preserved. A much less sum than has been realised by the writer would materially increase the profit from the crop. Ten bushels of seed per statute acre is a moderate produce, and at 5*s.* or 6*s.* per bushel, which it is certainly worth as cattle food, the preservation of it would be sufficiently remunerative. It may be observed that to a large grower the winnowing and stacking of the crop is by much the more convenient plan, as the attention and labour required by the treatment in the water and on the Grass are thus transferred from the hurried season of harvest to the following summer, when a time can be chosen which shall not interfere with the other business of the farm.

TEN ACRE FARM—SEASON 1851-52.

Miscellaneous.

How Prize Cattle are Fed.—Mr. J. P. Phillips, of Broomborough, near Totness, in Devonshire, had a fine animal which was much admired for its size and symmetry. On the 19th of June last it weighed 13 cwt. 1 qr. 14 lbs., and was fed on Grass till the 18th of September, when it weighed 15 cwt. 1 qr. 18 lbs.; it was then put on common Turnips till the 30th of October, when it weighed 16 cwt. 1 qr. 8 lbs.; from that time it was fed with Mangold, meal, and hay till December 18, when it weighed 17 cwt. 3 qrs. 18 lbs. The general results were these:—When on Grass, it gained in 13 weeks 228 lbs., being rather more than 17 lbs. per week; on Turnips and meal, in six weeks it gained 102 lbs., being about 17 lbs. per week; and on Mangold and meal, in seven weeks 178 lbs., being about 25 lbs. per week.

Calendar of Operations.

FEBRUARY.

WEST SUSSEX, *Feb.* 20.—Since our last we have but little to report, except what every one reports, that the weather has been very severe, not so much snow, but a piercing wind and the dust flying on the roads they are so dry. It has not suited us so well for our Sheep, for the Turnips are hard to get up and then do them but little good, although they disappear very fast, and make us fear that we shall be hard up before the Grass comes. We have not at present any prospect of an early spring; everything has been put back with a vengeance, and now we must trust to hay and cake to eke out our other food. But though it has been so cold the ewes and lambs have not done so badly; we could hardly have expected them to do so well. The Wheat now looks very much cut down, but there has yet no harm happened to it. But how it may be with the young Clover we can hardly say; it was so wet before, that I fear it will be almost cut up; the Trifolium appears lifted out of the ground. Fat cattle must now turn out though they are not in first-rate order; the supply of food will not admit of any extra fatting, so that we are likely to see markets rather declining, but more from under-fat ones coming out than from any real fall in their value. Sheep have lately sold heavy, and pork has fallen from the high figure it was at in December—that is, from 4*s.* 8*d.* to 4*s.* 4*d.* per stone. The rick-yards are getting very much reduced, but the corn is not by any means all consumed, but stored up in various ways, as few think that under present circumstances we can have prices low, so they are not disposed to give way to any little depression very readily, and it is seldom that there is so little left in hand at this time of the year. Of course we are shut out of the ground at present, but must at the first opportunity turn the ploughs in where the sheep have finished eating off so as to get in Oats. At present carrying chalk and dung is all that we can do, but enough of this would be a great acquisition to hungry heavy land. *G. S.*

Notices to Correspondents.

GILLETT'S SUBSOIL COMPANION: *Peter* asks for information about this. It was spoken of favourably at a meeting of the Stow Agricultural Society. Can any one give information of its further use, successful or otherwise?

OXALIS TUBEROSA: *H H.* At page 423 of the *Gardeners' Chronicle* for 1854, it is said that some small tubers of this plant were raised in the spring in a Melon pit, and transferred to a glass-wall, where they continued growing till killed by frost in November, when their stems were five feet high, and numerous tubers had been found fully an inch in diameter. You will find further particulars on referring to the page named.

POULTRY: *A B.* The head of a full-grown turkey is at all times the "tender point;" but as we have never known or even heard of such a disease as our correspondent complains of, we can only attribute it to the "frost." To all young poultry keepers we would say a "word in season;" do not attempt to obtain any chickens until the present cold weather is at an end. Those hatched in the early part of April will be sufficiently early for all purposes, even for obtaining prizes.

STATISTICS OF CATTLE FEEDING: *Erratum.* At page 107, instead of nearly "20" tons read "26" tons to the acre. Our valued correspondent "Y." states that when the Turnip crop is lifted as late in December as the weather permits, he applies the following method for testing the weight of his crop. He says—"I pull first single rows at intervals of 20 yards through the field and weigh them; when dressed 150 yards of ridge were found to give on the average near 14 cwt., or 13 cwt. 3 qrs. 14 lbs., the ridges being 2 ft. 6 in. apart; the result appears near 27 tons per acre. I also mentioned a load which had been weighed; the Turnips averaged 3½ lbs. each, being 1 foot apart; the result appears near 26 tons per acre.

*** We have to apologise for the delay of several answers, owing to the absence of the Editor in Scotland.

RENDLE'S AGRICULTURAL PRICE CURRENT AND FARM DIRECTORY FOR 1855, *with Newspaper Stamp to go free by post, is now published, and can be had in exchange for six penny stamps.*

The proprietors of this well-known and widely circulated publication have much pleasure in announcing another edition for the present year. They have spared no expense nor trouble in making it a most useful and serviceable guide to all who take an interest in the cultivation of the soil. It contains a valuable Descriptive List of all the best AGRICULTURAL SEEDS, with prices affixed to every article, with cultural remarks and general information as to the best varieties for various crops.

The List of TURNIP SEEDS is very comprehensive, and is embellished with an ENGRAVING of RENDLE'S IMPROVED SWEDE TURNIP—a variety in great favour in the West of England.

The descriptive Lists and Tables of the best selected GRASSES are very complete, and will be found eminently useful to all who intend laying down land for Permanent Pasture, Ornamental Parks, Pleasure Grounds, &c.

There is a very useful ALMANACK, which has been compiled with much care.

In the MANURE DEPARTMENT there is a general Price Current of all the leading Manures, including Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, &c.

The ORIGIN AND HISTORY OF PERUVIAN GUANO will be found amongst its contents, as well as some excellent advice for detecting the spurious from the genuine article. The proprietors have been favoured with some good sound advice to Farmers on this point by J. C. NESBIT, Esq., the celebrated Agricultural Chemist. They have also reprinted PROFESSOR WAY'S LECTURE on the same subject, from the *Gardeners' Chronicle*, read to the Members of the Royal Agricultural Society.

Descriptive articles relating to Lawes' Patent Superphosphate, Nitrate of Soda, the new Mexican Guano, and other manures will also be found very useful and interesting.

The "SUPERPHOSPHATE CONTROVERSY" in the Plymouth Papers is also given at length. The whole of the letters are reprinted from the *Plymouth Herald*. In this Controversy the "*Gypsum mixers*" are fully exposed by Mr. J. PRIDEAUX, the eminent Agricultural Chemist.

A valuable Paper has also been written expressly for this Edition by Mr. R. ERRINGTON on the "*Cultivation of the Potato*," as well as an article on "*Liquid Manure*" by the same gentleman.

The Proprietors have also much pleasure in stating that they have been favoured with two Original Articles, by J. B. LAWES, Esq., Rothamsted, the celebrated Agricultural Chemist, on "*The Artificial Manures most suitable for the Growth of Barley*" and "*The Cultivation of one Grain Crop after another on heavy land.*"

There will be a good Engraving of the CEDRUS DEODARA, one of the hardiest and best varieties of Cedars ever introduced, and prices of various Forest Trees, Shrubs, and Fruit Trees.

Engravings and descriptions of a great many Agricultural Implements are also added in the present Edition, and amongst them will be found M'CORMICK'S AMERICAN REAPER, GARDNER'S TURNIP CUTTER, SAMUELSON'S REGISTERED LAWN MOWER, PATENT LIQUID MANURE DISTRIBUTOR, WARNER'S GARDEN ENGINES, PUMPS, SYRINGES, &c.; FOWLER AND FRY'S CHAFF CUTTING MACHINE AND ONE ROW TURNIP DRILL, ANTHONY'S PATENT AMERICAN CHURN, AND PARKES' STEEL DIGGING FORKS.

Descriptions are also given of the New CHINESE POTATO (Dioscorea Batatas) and the FLUKE KIDNEY POTATO, a sort highly recommended in the Midland Counties.

At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It contains 28 folio pages, "Chronicle" size.

Copies can be procured, price 6*d.* each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the

LONDON PUBLISHING OFFICE, 294, STRAND;

Or from the Proprietors, WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

NEW AND IMPORTANT LEVELLING INSTRUMENT.

GILLESPIE'S PATENT INCLINOMETER, for Taking, Fixing, and Adjusting Surface Slopes of Lands, Earthen Embankments, Railway Gradients, &c, and the Dip, Outfall, or Rise of Drains, Water Courses, &c., and universally applicable to determine the plans and aid the execution of all levelling or sloping operations known in civil engineering.

PRICES:—Inclinometer, with mahogany frame and brass mounting ... ... £3 3*s.* 0*d.*

Do. with oak frame and wrought iron mounting 2 12 0

Light Telescope, 10*s.* 6*d.* extra.

TESTIMONIALS.

From Mr. James Gentles, Contractor.—"I have for a considerable time past used Gillespie's Patent Inclinometer in extensive drainage operations carried on by me, and I have found it to be of the greatest service, in showing the minutest slope in the ground, and in saving of labour; and I could not have constructed many of the drains with any degree of accuracy without its assistance"—James Gentles, Hart Hill, by Whitburn.

Extract of a letter from John Mitchell, Esq., Stand Hill, Bathgate.—"I highly appreciate its capabilities as a levelling instrument. In level lands, where there is a difficulty in detecting in which direction the land slopes, it is invaluable."

Extract of a letter from Mr. John Turner, Surveyor, Whitburn.—"The more I have tested it the more have I appreciated its value. By this invention the power of levelling is brought within the reach of all men of ordinary capacity."

Sold by WILLIAM DRAY & Co., Engineers, &c., Swan Lane, London. Specimens and Models may be seen at their Warerooms. Also a Descriptive Treatise on the nature and uses of the Patent Inclinometer, and copies of Recommendations of its efficiency and value to be had on application.

GLAZING WITH OR WITHOUT PUTTY.

E. DENCH, Patent Hothouse Works, King's Road, Chelsea.—Priced Price List supplied on application.

SHEET GLASS (15 oz.) of good quality in 100 feet boxes.

SIXTEEN-OUNCE SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO Mr. Rivers, and of various dimensions, always on hand.

Double-crown Glass of various dimensions in 100 feet boxes.

Glass Tiles, ¼ of an inch thick, packed in cases, containing 50, at 1l. 17s. 6d. per case. Packages 2s. each extra, but allowed for when returned.

Glass Milk Pans, 21s. per dozen; Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoys' Milk Syphons, Wasp Traps; Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

TO GARDENERS AND OTHERS.

THE BRIDGEWATER FIRE AND WATER-PROOF MINERAL PAINT.—An Important Discovery.

This substance is a vein of earth found only in one of the Bridgewater Mountains of New Jersey, in the United States. It is the most extraordinary paint offered to the public, possessing new and valuable properties, and applicable to a variety of purposes. Its colour is dark red, never fading or changing in the hottest climates. When mixed with any other paint, the colour produced by that mixture will be rendered unfading also. After it has been applied and exposed to the atmosphere a few months, it becomes fireproof, and as durable as stone. Wherever it is applied neither rain, sea-water, nor damp can penetrate; thus preserving iron from rusting, wood from rotting, and brickwork from damp. It will endure intense heat without cracking or blistering. It has also the property of flexibility; Canvas, Tents, &c., covered with it become waterproof, retain their previous flexibility, and are not liable to crack when they are rolled up. Coarse Wrappers, covered with two coats of it, are an excellent substitute for Russian mats, to cover gardeners' pits and frames, or to protect wall fruit trees, being cheaper and more durable. If two coats of it be applied to trees, above and below the ground, where the borer generally enters, it will prevent the attack of that destructive grub, or insects of any kind; a new bark will be formed under the paint and the trees kept in a healthy condition. It is spread out easily, and does not emit any unhealthy effluvium.

A specimen of the paint on coarse wrappers for Gardeners and others may be seen at J. Le Creu's, House-painter, 26, Moorgate Street, who undertakes to supply Gardeners and the public with any quantity of painted wrappers at moderate prices.

Sole Consignee for the United Kingdom, John Eives, 17, Cornhill, London. Sold by Agents in most of the principal towns of the United Kingdom. In London by L. Frank & Son, Oil Merchants, 14, Borough, London Bridge, of whom may be had Quick Drying Oil to mix with it, for use during the winter season, and also Testimonials in its favour from Shipowners, Builders, Painters, &c.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

BLOSSOM OF FRUIT TREES.—WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7d. per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices.—R. Richardson, 21, Tonbridge Place, New Road, King's Cross, London.

HALL'S GARDEN NETTINGS; the best and cheapest for all purposes of shelter and shade from Frost, Hail Storms, and Gales of Wind. No. 0, 5d.; No. 1, 5½d.; No. 2, 6d.; Nos. 3 and 4, 7d. All 56 inches wide, and in lengths of 10, 20, 30, and 60 yards.—Manchester.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

FRUIT TREES, POULTRY, RABBIT, SHEEP, AND LAMB FENCING.—Worsted Netting, to protect the Bloom of Peach, Nectarine, and other Trees, Flower or Seed Beds, from frost, blight, and birds, 2 yards wide, 5d. to 6d. per yard. New Twine Netting (tanned if required), 1 yard wide, 2d. per yard; 2 yards wide, 4d. per yard; 4 yards wide, 8d.; half-inch Mesh do., 2 yards wide, 8d. per yard. Tanned Netting, 2 or 3 yards wide, 1½d. per yard; 4 or 6 yards wide, 3d. per yard. Elastic Hexagon Garden Net, or Scrim Canvas, 4½d. per square yard. Cocoa-nut Fibre, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4d. to 6d. per yard. Rabbit Net, 4 feet wide, 2d., 6 feet wide, 3d., 8 feet, 4d. per yard. Each edge corded, ½d. per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3d. to 4d. per square yard; this is the best article for Fencing against Fowls, Cats, &c.—W. Cullingford's, 1, Edmund Terrace, Ball's Pond, Kingsland, London.

CHEAP WIRE GAME & POULTRY NETTING, 5d. per running yard.

GALVANISED DITTO, 7d. per running yard, 2 feet wide.

	Galvanised.	Not Galvanised.
24 in. wide, 2 in. mesh,	7d. per yard.	5d. per yard
30 in. " 2 in. "	9d. "	6½d. "
36 in. " 2 in. "	10½d. "	7½d. "
48 in. " 2 in. "	1s. 2d. "	10d. "

Sparrow Proof Netting, Galvanised, 3d. per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1s. 6d. and 2s. 3d. per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. Fox, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

GALVANISED WIRE NETTING FOR GAME AND SHEEP FENCING, AVIARIES, PHEASANTRIES, &c.

2 inch Mesh, light, 6d. per lineal yard, 2 feet wide.
" strong, 8d. " "

Netting of any size or quantity, and Fencing of all kinds, supplied on the shortest notice.

William Dray & Co., Manufacturers, Swan Lane, Upper Thames Street, near London Bridge.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. Treloar, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

"FRIGI DOMO," a Canvass made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey, and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

STEPHENSON and PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING or SALTING MACHINE for GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by Alexander Shanks & Son, Arbroath, Forfarshire, from whom particulars with prices may be had.

HOT-WATER PIPES at wholesale prices, with Elbows, Syphons, Tee Pipes, and every requisite connection. Cast Iron Boilers, 55s. each. Improved Soot Doors and Furnace Doors. Builders' Castings of every description kept in Stock at — Mr. LYNCH WHITE'S, Old Barge Iron Wharf, Upper Ground Street (near Blackfriars Bridge), London.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

GARDEN ORNAMENTS.—Several Hundreds of VASES, FIGURES, and SUN-DIAL PEDESTALS, which have stood wholly exposed to the late frosts, may now be inspected at

AUSTIN and SEELEY'S Show Yard, Keppel Row, New Road.

☞ A few articles which have been standing as patterns for many years will be sold at reduced prices. Any gentleman unable to visit the yard may have sketches sent, if he will describe the object required, and the price.

ECONOMY IN SHIRTS.

EVANS (6 years with B. Nicoll), now manufactures the best Long Cloth Shirts, Linen fronts, &c., 6 for 37s. 6d.; in Linen, 6 for 57s. 6d.; Three-fold Collars, 10s. 6d. per dozen. Sample Collar, for 12 stamps, and easy directions for measuring, post free, sent by John Evans, Inventor and Sole Manufacturer of the Elysian Shirt, 13a, New Bond Street, London.

☞ See the *Times*, February 19th.

LADIES' HEADDRESSES.—Whatever may be attempted in the production of the most elegant Ladies' Headdresses, whether designed by the highest taste, or executed by the most undoubted skill, must fail in the accomplishment if the roots of the hair have lost their proper tone and firmness, one of the common causes of lank and weak hair, or if the hair itself has begun to decay or fall off in patches. The certainty and facility with which these defects are obviated by OLDRIDGE'S BALM of COLUMBIA, from its nourishing and bracing qualities, have long obtained for it that extensive reputation which it is so well known to possess. The first application causes the hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again. Price 3s. 6d., 6s. and 11s. per bottle. Sold retail by the proprietors, 13, Wellington Street, North Strand.

EFFECTUAL SUPPORT FOR VARICOSE VEINS.—This beautifully elastic compressing Stocking is impervious, light, inexpensive, and easily drawn on without lacing or bandaging. Instructions for measurement with prices on application, and the articles sent by post from the Manufacturers, Pope & Plante, 4, Waterloo Place, Pall Mall, London.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. Douglass, 18, Holland Street, Brixton, London.

PARR'S LIFE PILLS correct disorganisation of the stomach, and restore a healthy action of the liver, bowels, and kidneys, and remove pains in the back without the least griping or inconvenience. Persons who are suffering from headache or indigestion, whether arising from constitutional inaction, biliary disarrangement, or over-indulgence at the table, are particularly recommended to try Parr's Pills. They have never been known to fail in affording immediate relief. Parr's Life Pills will prove highly efficacious in bilious complaints, scorbutic complaints, affections of the nervous system, lowness of spirits, palpitation of the heart, rheumatism, pains in the head, limbs, and other parts of the body, oppression of the chest, indigestion, redundancy of bile, dizziness of the eyes, violent pains in the temple and across the forehead, impaired memory, sick headache, tremulous action of the whole frame, restlessness, and bad dreams, stuporific dozing, flatulency, costiveness, &c.

London Agents:—E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, Farringdon Street; Sutton & Co., Bow Churchyard; Hannay & Co., 63, and Sanger, 150, Oxford Street; and can be obtained through all respectable chemist and medicine vendors in town and country.—In boxes, price 1s. 1½d., 2s. 9d. and in family packets 11s. each. Full directions with each box. None are genuine without the English Government stamp fixed round the sides of each box.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

In a few days, in fcp. 8vo, with many Woodcuts,

THE GOLDEN COLONY; or, Victoria in 1854: With Remarks on the Geology of the Gold Fields of Australia. By G. H. WATHEN. Illustrated from Sketches by the Author.

London; LONGMAN, BROWN, GREEN, & LONGMANS.

Second Edition, enlarged, in fcp. 8vo, price 5s. 6d.

THE CHOICE AND COOKERY OF FISH: a Practical Treatise. By PISCATOR.

"This is one of the most useful volumes of the kind ever issued. We find in it concise and lucid directions, both as regards the selection of fish and the dressing of it. Now, these two subjects have often been treated by various writers, but we have never met with a work so thoroughly clear on the matters of fact, nor so mentally pleasing in the rendering of those matters of fact. Piscator not only enlivens with culinary tactics, but he interests with a graphic sufficiency of natural history relative to fish. With the salmon and the sprat, the mackerel and the mussel, the conger and the crab, the turbot and the tench, he is equally at home. He seems to be cognisant of all processes between the shoal in the fishing-boat and the sauce in the butter-boat. He can tell you the best management of a white shark and the most delicate condiment for a red herring. We beg to say that the ladies of our household are so satisfied with Piscator's agreeable and sensible edification that the volume has been appropriated by them, and on the warrant of this we cordially commend the book to all who like a fish dinner in perfection."—*Sun.*

AN INTRODUCTION TO THE STUDY OF JURISPRUDENCE.

BEING A TRANSLATION OF THE GENERAL PART OF THIBAUT'S SYSTEM DES PANDEKTEN RECHTS WITH NOTES AND ILLUSTRATIONS

By NATHANIEL LINDLEY, of the Middle Temple, Esq., Barrister-at-Law.

WILLIAM MAXWELL, 32, Bell Yard, Lincoln's Inn, Law Bookseller and Publisher; HODGES & SMITH, Grafton Street, Dublin.

NURSERY AND SEED BUSINESS, ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.—Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

DISTILLERY FOR SALE, in the neighbourhood of London, in full and profitable work, turning out about 7000 gallons per week, and requiring but moderate capital. May be had on advantageous terms under particular circumstances.—Apply to Messrs. BOOKER & Co., 59, Mark Lane.

TO NURSERYMEN, FLORISTS, ETC.

TO BE SOLD, and may be entered upon immediately, at a fair valuation, or by private contract, a most eligible and old-established NURSERY, of nearly 10 acres, well stocked, situate in a large town, close to the London and North-Western Railway Station, and convenient for railway transit to all parts of the kingdom. To a person of good capital it presents an opportunity rarely met with. The entrance grounds, recently laid out, are most pleasantly situated. The Vinery, Greenhouses, Pits, and Frames well stocked with Camellias, Geraniums, &c., are of recent erection, and have been arranged with strict attention to usefulness and convenience, having an excellent supply of water from cisterns in each house, supplied from the roof, and also a fine Pond in the centre of the grounds, with an Ornamental Fountain. There is a handsome Seed Shop at the entrance, excellently fitted up, with a Warehouse and Counting-house attached. The Purchaser would be required to pay two-thirds of the amount on entrance, and to give satisfactory security for the remainder in six months.—For particulars apply to Mr. J. AGNEW, Nurseryman and Seedsman, Coventry.

TO BE SOLD, by private treaty, a NURSERY and PLANT BUSINESS, established nearly 70 years. The Proprietor of this old-established Nursery Business is willing to retire, and dispose of the Stock and Good-will. The nursery comprises about 20 acres of ground, and about 15 large and commodious Stove, Greenhouse, and Propagating Houses, with numerous Pits, frames, &c. *The business is in full working order, and is capable of being increased to almost any extent, and of being made one of the best provincial nurseries in the kingdom.* The stock is in a flourishing condition, being young, healthy, and in good saleable order, and comprises a general assortment of all the most saleable Forest Trees, Shrubs, Fruit Trees, Stove, Greenhouse, and Miscellaneous Plants. The Nurseries are situated close and adjoining one of the largest towns in the West of England, with a population of more than 100,000 inhabitants. The whole of the land, houses, &c., belongs to the proprietor, *who will have no objection to grant a long lease to his successor or successors, and at least one-half of the purchase money could remain on security at common interest.* The business has been carried on with great success by the present proprietor, which partly contributes to his retiring from the business. None but principals and *bonâ fide* purchasers will be treated with.—Address in the first instance, A. B. C., Office of this Paper.

TO BE SOLD, the NURSERY STOCK and SEED SHOPS in Glasgow and Paisley, and Goodwill of Business, belonging to the sequestered estate of Mr. Thomas Robertson, situated at Greenlow and Billfield Nurseries, Paisley. Also the stock of Seeds, &c., in the premises, Candlerigg Street, Glasgow, and in the shop at the Cross of Paisley. The nursery stock and shop stocks will be sold either altogether or separately, as may be arranged. This is an excellent opening for any party wishing to commence business in the above line, and well worthy of attention. The nursery stock is of a very superior description, and one of the most extensive in Scotland, comprising all descriptions of plants. The greenhouses also contain a very beautiful selection of the choicest flower plants, foreign and home. Inventories will be seen on application to JOHN FLEMING, Accountant, 21, St. Vincent Place, Glasgow, by whom offers will be received either for the whole or separately, as offerers may incline.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trellises, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Bunhill Row, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

DORKING FOWLS.—Eggs, from remarkably large and weighty birds, of the best coloured breed, will be disposed of at 15*s.* the dozen, box included.—Address W. G., Railway Inn, Holme, Stilton, Hunts.

COLOURED DORKINGS.—EGGS, from coloured Dorking Fowls, which have taken prizes and been commended at Reading, Cambridge, Norwich, and Colchester Shows at half a guinea the setting of 13; also Eggs from prize Buenos Ayrean Ducks at the same price.—Apply to Rev. E. H. KITTOE, Chadwell Rectory, Grays, Essex.

EGGS, from the Yards of Mr. G. BOTHAM, Wexham Court.—Prize Spanish, 30*s.*; ditto Brahma Pootras, 21*s.*; ditto White Cochin, 21*s.*; ditto Grey Dorking, ditto Red Speckled Dorking, ditto Silver Pencilled Hamburgs, ditto Duckwing, Game, ditto Rouen and Buenos Ayres Ducks, at 10*s.* 6*d.* per setting of 13.—May be had by sending a Post-office order, payable at Slough. Box and packing, 1*s.*

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, March 8th, at 12 o'Clock, about 200 choice double Camellias, from 18 inches to 5 feet, comprising all the approved kinds, beautifully furnished with bloom buds; 100 very strong Camellia Stocks; also a choice assortment of Standard and Dwarf Roses; a fine collection of American Plants; choice Dahlias in dry roots Pœonias, Verbenas, Fuchsias, &c.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

T. F. WINSTANLEY, NURSERYMAN, SEEDSMAN, and FLORIST, begs respectfully to inform his patrons, the nobility, and public, that he has added to the above business that of AUCTIONEER and VALUER to noblemen, gentlemen, and nurserymen about relinquishing their establishments, or otherwise desirous of disposing of their stock of Conservatory, Greenhouse, and Stove Plants.

T. F. W. having been for some years in a Nursery previous to his coming to Manchester, trusts that his knowledge of Plants and their value will enable him the better to dispose of them than any ordinary Auctioneer.—28, Market Place, Manchester.

Just published, in 2 large vols. super royal 8vo., 3l. 15s.

FIFTY OF THE MOST EMINENT FARMERS, LAND AGENTS, AND SCIENTIFIC MEN OF THE DAY.

Illustrated by above One Thousand Engravings on Wood and Steel.

BLACKIE AND SON: WARWICK SQUARE, LONDON; AND GLASGOW AND EDINBURGH.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES

CONSISTENT WITH GOOD

MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

NEW CUCUMBER.

SIR COLIN CAMPBELL.

THE ABOVE is the Finest and most Superb New Hybrid Cucumber ever yet sent out for Exhibition, Winter Cultivation, and every other purpose for which a Cucumber is required.

SIR COLIN CAMPBELL CUCUMBER.

THE above Cut is an exact representation of the fruit grown this summer, which measured exactly ten of its diameter long, being 25 inches, with not more than half an inch handle. It is a splendid Black Spine, of a dark green colour, and free from ribs or shrivels; grows very quick, sets free, and carries its bloom well. As a Cucumber for Exhibition nothing can surpass it, and is very prolific, often throwing out four or five fruit from every joint, and the vines are short jointed. The fruit is solid, and eats very crisp, and for market it keeps its bloom well for many days, not turning colour at the stem or point as most varieties do. Fruit was cut from the above in January 1854, and the same plants continued to produce fine fruit until the end of October.

UNEQUALLED NEW MELON,
GOLDEN DROP GREEN FLESH.

EDWARD TILEY having purchased the whole of Messrs Wood & Son's stock of Seeds of the above-named Melon, can with confidence recommend it to all growers of that splendid fruit. It has been thoroughly proved by an eminent Melon grower, and declared by all who have seen and tasted it to be one of the finest-flavoured Melons yet grown. It is a very beautiful colour when ripe, skin very thin, flesh firm and solid, and of a most superior melting and delicious flavour. Free setter and prolific bearer. It possesses a great advantage over others in its exceedingly handsome appearance when placed upon a table or on the stall of a fruit salesman, and for exhibition this Melon will be the favourite.

THE KING, Superb Scarlet Flesh Melon.—This is a variety very much wanted, and which has for some time past been neglected, but is now becoming in great request; such being the case, EDWARD TILEY has just procured a stock of this most superb Hybrid Scarlet Flesh Melon which he can recommend with as great confidence as [illegible] before sent out by him, and which have all given the greatest satisfaction to the public.

Each of the above varieties [illegible] had in packets containing six seeds 1s. 6d. per packet.

The following fine varieties [illegible] Melons can be highly recommended, and are all warranted [illegible]:—

The Queen	1s.	Beechwood	1s.
Bromham Hall	1s.	Windsor Prize	1s.
Incomparable	1s.	Emperor	1s.
Golden Ball	1s.	Fleming's Hybrid Persian	1s.
Golden Perfection	1s.	Blackall's Green Flesh	1s.
Bowood	1s.	Bailey's ditto	1s.
Victory of Bath	1s.	Snow's Hybrid	1s.
Camerton Court	1s.	Gordon Castle	1s.
Chichester Prize	1s.		

A packet of the Golden Drop and one of the King Melon, and one packet of any other variety mentioned will be forwarded, post free, on receipt of 3s. 6d. in cash or penny postage stamps.

NOTICE.

EDWARD TILEY having received several letters wishing to know if his new seedling "Champion Kidney" Potato is the same as the one advertised by Mr. Joseph Wilson, of Ipswich, under the name of "The Early Champion Ashleaf," begs to say that it is not, for he purchased the whole stock from the Grower, who obtained it in the first instance from the seed of the Potato Apple, and has never parted with any of the produce but to him. E. T. feels confident that it will give the greatest satisfaction to all purchasers who may favour him with orders for the same.

TILEY'S SEEDLING POTATO.
THE CHAMPION KIDNEY.—Never before sent out.

This Potato bears a great resemblance to that fine old Potato, the Ashleaf Kidney; it possesses the following good qualities over the Ashleaf. If planted at the same time it will be ten days earlier, all the sets always vegetate well, and do not die off in the ground as the Ashleaf does; 2 pecks of seed will produce a greater weight of Potatoes than 3 pecks of the Ashleaf. It is quite equal to that in flavour, and is eatable during the whole winter. Sets that have had the shoots broken off five or six times during the spring will vegetate again as if it had been the first shoot. About twenty Gentlemen and Gardeners who had seed to plant last season have assured me that they never before grew any Potato to equal it, and should continue to grow it as a first early Potato. Numerous orders have been already received from persons who saw it growing during the last summer. It has been grown and thoroughly proved for the last four years, and found to be less liable to disease than any other Potato that has been grown. Out of 25 sacks grown this season there was not a single diseased Potato among them.

Sold in quantities of not less than 1 peck; they will be sent Hamper and Package free, at 5s. 6d. per peck, or 4 pecks for 1l., hamper free. A remittance in cash must accompany all orders, or small amounts in penny postage stamps. Purchasers would do well to name the nearest railway station to their residence.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST, 14, Abbey Church Yard, Bath, Somersetshire.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

GODFREY'S BLACK SPINE.
SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2s. 6d.; 6 ditto, 1s. 6d.

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1s. each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, February 24.

CONTENTS OF SUTTON'S COLLECTIONS OF GARDEN SEEDS,

—In consequence of the numerous applications for the particulars of sorts and quantities contained in these Collections, Messrs. SUTTON have prepared a List of the CONTENTS of the COLLECTIONS, which they have no doubt will be generally and highly approved. This List may be had for one penny stamp, post free.

Gardeners and others who may prefer making their own selection are recommended to apply for our GENERAL PRICED CATALOGUE.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

CEMETERIES.

WILLIAM MASTERS AND SON having been engaged upon extensive Cemetery works, are prepared to undertake the LAYING OUT and PLANTING NEW GROUNDS, as well as the Ornamenting such as are closed by the recent Act of Parliament, by contract or otherwise.—WILLIAM MASTERS & SON, Landscape Gardeners, Canterbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

LANDSCAPE GARDENER AND GARDEN ARCHITECT.

MR. W. DAVIDSON having lately concluded his engagement with Sir William F. F. Middleton, Bart., Shrubland Park, in consequence of the completion of extensive alterations on which he has been there employed, respectfully tenders his services in the above capacities to noblemen, gentlemen, and the public generally, in laying out or improving Gardens, Grounds, Parks, Cemeteries, Arboretums, &c.; designing Conservatories and other garden structures.

Mr. D. feels strongly the importance of the opportunities he has had of maturing his taste for natural arrangement and artistic design under Sir William and Lady Middleton, and appeals with confidence to Shrubland for examples of his practical and scientific knowledge as a civil engineer, in directing the satisfactory and economical execution of works in general.

Mr. D. begs to mention further that his practical experience enables him to offer advice upon all subjects connected with a garden, both structural and cultural, and he will give careful attention to every matter, extensive or otherwise, in which his advice may be required; and will regulate his professional charges in proportion to the nature and extent of each particular case. Mr. D. is kindly permitted to refer to Sir William Middleton, Sir Charles Barry, Westminster, Dr. Lindley, and many others who are pleased to consider him worthy of their recommendation.—37, Bloomsbury Street, Bedford Square, London.

FLOWER POTS and STANDS of all kinds, including Suspension and Bracket, of the most approved shape, Classical, Italian, and Grecian Vases, Pedestals, Fountains, &c. in stock. Prices for 1855 forwarded on application to WILLIAM MAULE & SONS, Horticultural Potteries, Bristol.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 16s. per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and loam at moderate prices.—KENNARD, BROTHERS, Swan Place, Old Kent Road.

CRYSTAL PALACE.—HORTICULTURAL FETE.—It is intended to hold a grand Horticultural Exhibition at the Palace on SATURDAY, the 2d June next. The Rules and Schedules of Prizes will be immediately issued, and early notice will be given when they are ready for distribution.

Feb. 24. By order. G. GROVE, Secretary.

THE NATIONAL FLORICULTURAL SOCIETY.—The Anniversary Meeting, by adjournment, will be held on THURSDAY next, the 8th instant, at 1 o'clock precisely, for the Election of Officers and other business.

21, Regent Street. J. EDWARDS, Hon. Sec.

NORTH OF ENGLAND SEEDLING SOCIETY.
ESTABLISHED AUGUST, 1854.

Gentlemen, Professionals, Amateurs, and others desirous of joining the above Society are requested to observe that the annual Entrance Fee, viz. 5*s*., will become due on March 7, 1855. Meetings for the Exhibition of Seedlings will take place at the Commercial Inn, Bolton, on the following days, viz. May 30, July 18, September 19, 1855. Prospectuses of Society, &c., with any other information, on application to the Secretary.

R. DUNDERDALE, President.
P. CHARLTON, Secretary.

ENROLLED AGREEABLY TO ACT OF PARLIAMENT.
UNITED GARDENERS' BENEFIT SOCIETY
Waterloo Arms, Camberwell, Surrey. Instituted 1839.

This Society (established for Gardeners only under 35 years of age), has proved for 16 years the accuracy and soundness of principle upon which it is founded, namely, the highest amount of benefits to be received by its Members in Sickness, Superannuation, and Mortality, for the smallest amount of contribution consistent with stability and permanence. The accounts are always open to the inspection of all the members, who have also the control of the expenditure of its funds; it is therefore incumbent on all, by a small monthly contribution, to provide against the casualties of life, from which none are exempt, by enrolling themselves in a Society of this nature, which guarantees 12*s*. per week in sickness; 3*s*. and 4*s*. per week superannuation; 10*l*. at the death of a member, and 8*l*. member's wife, for the small contribution of 2*s*. 3*d*. per month.

Camberwell Green, Surrey. CHARLES STUNELL, Secretary.

CAMELLIA JAPONICA.
CHANDLER AND SONS' extensive collection of this beautiful plant is now coming into flower, and promises to be very fine this season. Healthy plants with Flower-buds, in a fit state for travelling without injury, 3*s*. 6*d*. to 5*s*. and upwards each.—Wandsworth Road, Vauxhall.

ONION SEED for Sale, 3*s*. 6*d*. per lb. SPANISH WHITE ROUND, the same charged by dealers, 6*d*. per oz.—Apply by letter, post paid, to B. S., 4, Crooked Lane, London Bridge.

PAGE & Co. having a large Agricultural connection, their prices are, strictly speaking, *Farmers' Market Prices*.
Seed Stores, Oxford Street, and Above Bar, Southampton.

CABBAGE PLANTS.
THOMAS WELLAND, GARDEN AND CATTLE CABBAGE NURSERYMAN, offers true and strong Drumheads, Early Battersea, Early York, Early Imperial, &c., safely packed for any part of England, Scotland, Ireland, and Wales, for 3*s*. 6*d*. per 1000; crates included.
Surrey Gardens, near Godalming, Surrey.

WANTED TO PURCHASE, a quantity of FRUIT TREE STOCKS and MAIDEN TREES.—Address, stating sorts and price, JAMES LAKE, Nurseryman, Bridgewater.

LIQUIDAMBAR.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

IPOMŒA RUBRO CÆRULEA.—Seed of this exceedingly beautiful Climbing Annual being now obtainable at a moderate price, all cultivators of flowers having a greenhouse or wall with warm aspect are advised to include it in their spring selection.—Seed supplied to Seedsmen and Nurserymen only, by GEORGE ROBERTS, 32, Moorgate Street, London.

FOWLER AND WRIGHT, SEEDSMEN and NURSERYMEN, Glasgow, have for sale 1 year Seedling LARCH, 2 year Seedling LARCH, 1 year Seedling BEECH, and 1 year Seedling ALDER. Price forwarded on application.—March 3.

PYRAMIDAL PEAR TREES,
GRAFTED ON THE QUINCE STOCKS.
J. AND J. FRASER have still to offer strong trees of the above PEARS; a Descriptive Catalogue of the sorts may be had on application. To prevent disappointment early orders are requested, as the Stock of some of the varieties is getting low.—The Nurseries, Lea Bridge Road, Essex.

FRUIT TREES, FOREST TREES, AND SHRUBS, GARDEN AND FLOWER SEEDS, PERMANENT PASTURE GRASSES, and FINE DWARF LAWN GRASSES. —Catalogues of the above may be had on application to WILLIAM BARRATT, Saint John's Nursery, Wakefield.

TO PLANTERS.
HAY, SANGSTER, AND CO., have for sale the following;—600 to 700 strong Standard PEARS, 500 Dwarf do., and 100 Dwarf-trained do. Any reasonable offer will not be refused, as the ground must be cleared by the 25th March.
Apply to HAY, SANGSTER, & Co., Newington Butts, London; of whom also may be had for seed York Regent Potatoes, 6*s*., and Early American, 8*s*. per bushel of 56 lbs., the produce of their prepared Cuttings. Terms cash.

JOHN GREGOR AND CO., NURSERIES, Forres, N.B., have for sale several millions of Seedling and Transplanted TRUE HIGHLAND SCOTCH PINE PLANTS, raised from Seeds collected in the celebrated native Forests of Strathspey. They have received the numerous premiums hitherto awarded by the Highland and Agricultural Society of Scotland for the propagation of the true native Pine. The superiority of such plants compared with the produce of planted woods, degenerated by cultivation, will be seen on referring to the article "PINE TREE" in *Morton's Agricultural Cyclopædia*, published by Blackie and Son.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz.:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Raby Castle. Also a quantity of strong dwarf-trained Pears and Plums of the best sorts, Fastolff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes, well kept, of the best sorts.—For further particulars apply to JAMES LAKE, Nurseryman, Bridgewater.

STRAWBERRY PLANTS.

WILLIAM NICHOLSON is now sending out fine strong plants of his four New and excellent varieties, viz., AJAX, the finest dessert fruit; RUBY, do.; CAPTAIN COOK, dessert and market; FILLBASKET, do., tremendous bearers, at 5s. per 100. The plants have been kept in frames under glass, and are in good condition for planting. Post-office orders payable at Yarm, Yorkshire, which are in all cases required with the order.

Egglescliffe, near Yarm, Yorkshire, March 3.

POLYANTHUS SEED.

JAMES WOODS has again this year to offer a quantity of POLYANTHUS SEED, saved with more than ordinary care, from named and good laced flowers, which he can recommend with confidence, having had numerous Testimonials from different parts of the Kingdom of good and valuable flowers being raised from his seed. He will be able to send seed to grow 300 plants, with directions for sowing. Price 1s. per packet, or sent free on receipt of 13 postage stamps to JAMES WOODS, Florist, Harwich, Essex.

P.S. Plants of Polyanthus will be sent out in April, with blooms on each plant, with name or otherwise, from 6d. to 3s. 6d. per plant.

J. W. has a small quantity of Auricula Seed, saved from a fine collection of Alpines, at 1s. per packet as above.

SHILLING'S SELECTED LIST OF SEEDS.

North Warnborough Nursery, Odiham, Hants.

STEPHEN SHILLING will send on application his List of Seeds and Prices for the season. Those who have tried his seeds in past years can vouch for their good quality. He will also send free of carriage to the principal railway stations in Hants, Berks, and Surrey a liberal selection for 1l. 10s.; a smaller selection, 15s.; either of which will be a suitable choice of quantities for gentlemen where professional gardeners are not kept. Collections of Flower Seeds, containing from 24 to 48 varieties, from 3s. 6d. to 12s., free per post. Trees, Forest and Fruit; and Evergreens. Potatoes, Walnut-leaved, Shilling's Frame, &c., and all other Kitchen Garden Plants, &c.

THE LARGEST STOCK AND LOWEST PRICES IN ENGLAND.

JOHN WESTWOOD, the Floral Nursery, Acton Road, Turnham Green, near London, having an enormous and well selected stock of SOFT-WOODED PLANTS, and most extensive premises (the glass covering 3 acres of land), is enabled to offer it to the public and the Trade at prices far lower than any hitherto heard of, but as it is impossible to convey by advertisement anything like detailed or sufficient information of the advantages or resources of his establishment, he respectfully requests all who desire to purchase plants to apply for his Catalogue for 1865 (which is now ready), and he will immediately forward it postage free.

SUTTON'S COMPLETE COLLECTIONS, CARRIAGE FREE.

PARTICULARS OF THE SORTS AND QUANTITIES CONTAINED IN SUTTON'S COLLECTIONS OF SEEDS will be SEEN AT PAGE 50 OF "GARDENERS' CHRONICLE" FOR JANUARY 27.

By the perusal of this List, it will be seen that the very best kinds of Vegetable Seeds may be obtained in full quantities, and proper proportions for one year's supply of a large garden for the sum of 3l., and other complete Collections of equally choice sorts for smaller Gardens at 2l., 1l. 5s., and 15s. The economy of cost is by no means the only advantage gained by ordering one of these Collections.

Address, JOHN SUTTON & SONS, Seed Growers, Reading.

SPLENDID IMPORTED GERMAN FLOWER SEEDS.

CHARLES PENNELL begs to offer to his patrons and the public, at reasonable prices, very superior and unrivalled collections of GERMAN SEEDS, comprising extra double German Bouquet Stocks, new large flowered; New Yellow and New Hybrid ditto, German Emperor, and the fine Autumnal and Winter Flowering varieties, &c. Extra double German Larkspurs, Salpiglossis, German Zinnias, in several fine varieties, Phlox Drummondi, and many other varieties too numerous to insert here, prices of which may be had on application.

C. P. takes this opportunity of announcing that owing to a three years' residence in different parts of Germany, including Prussia and Austria, he has been enabled by dint of great attention, to make one of the most superior selections of German Seeds ever before offered in England. He feels therefore the most unbounded confidence in offering the above to the public, being assured that they will afford the most ample satisfaction to all honouring him with their purchases.—Nurseries, Lincoln. Mar. 3.

DWARF-BUDDED ROSES,

Adapted either for Potting or Planting in Groups.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, have the pleasure of offering fine strong Plants of the following DWARF HYBRID PERPETUAL ROSES, at 15s. per dozen:—Baronne Prevost, Duchess of Sutherland, Jacques Lafitte, La Reine, Madame Trudeaux, Pius the Ninth (pillar Rose), Robin Hood.

The following at 10s. per dozen:—Madame Laffay, Marquise Boccella, Marquis of Ailsa, William Jesse.

N.B. A very liberal allowance to the trade on the above.

NEW ROSES.

WOOD'S DUCHESS OF NORFOLK, a superb bright crimson Hybrid Perpetual Pillar Rose, 10s. 6d. per plant. Usual discount to the trade, and a further reduction if six or more plants are ordered at once.

WILLIAMS' EVERGREEN CLIMBING ROSE, 3s. 6d. each. Usual discount to the trade.

NEW EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, beg to intimate to their friends that they ARE NOW prepared to send out AT ONCE good strong plants of WILLIAMS' EVERGREEN CLIMBING ROSE, at 3s. 6d. each, with the usual allowance to the trade, and a still further reduction if one dozen or more are ordered at once. Price may be had on application.

N.B.—Single Plants will be sent free per post on receipt of six penny postage stamps EXTRA to defray postage. Strong Plants of the above may also be obtained at the same price from Mr. CHARLES TURNER, of the Royal Nursery, Slough.

WILLIAMS' EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, have strong Plants of the above now ready for delivery. This highly interesting and valuable addition to the class of Evergreen Climbing Roses was raised by the late John Williams, Esq., of Pitmaston. It is a Seedling from Ayrshire Splendens, fertilised with Yellow Tea. Its rapid growth and elegant habit is precisely like the Ayrshire Splendens, while its glossy foliage and long lemon-coloured buds partake of the character of the Yellow Tea. Its flowers are creamy white, deliciously sweet-scented, and are borne in long racemes of 12 to 20 on a single shoot, being produced from every axil. It is highly desirable for covering walls, lattice work, verandahs, or buildings of any kind, and, as a pillar Rose, is unequalled, being of an extremely elegant habit for forming festoons or arches, and is also very hardy. For Bouquets it is a most beautiful variety, producing an immense number of its finely formed buds. It only requires to be grown to be pronounced the best Climbing Rose for all purposes in cultivation.

Good established Plants at 3s. 6d. each, with the usual allowance to the trade, and a further reduction when one dozen or more are ordered at once.

MYATT'S NEW SEEDLING POTATO. BROCKLEY KIDNEY.

W. AND J. MYATT can dispose of a limited quantity of the above excellent new Potato, which they have proved to be a first-rate variety, and has been selected as the best out of many thousand seedlings raised at Manor Farm.

In flavour it is quite equal to the Ash-leaf, and for produce very far superior: it is a compact strong grower, and ripens off quickly, making it an invaluable summer variety. To be sent out in peck bags, 3s.; bushel, 56 lbs., 10s.

Also, EARLY MAY or BRITISH QUEEN, the earliest round Potato, middling size, suitable for planting whole, 5s.; Early Shaw, 5s.; York Regent's, 5s.; Hen's Nest, a good field Potato, 5s per bushel; Red Ash-leaf, 2s. 6d. per peck. These are all one year's growth, from Yorkshire or Scotch sets, and will be delivered free to any railway terminus in London.

Post Office Orders are requested from unknown correspondents, payable at Deptford, to WILLIAM MYATT.—Manor Farm, March 3.

NOTICE.—For full particulars of EDWARD TILEY'S two unequalled new Cucumbers, Melons, and Seedling Potato, see advertisement in *Gardeners' Chronicle* of 24th February, 1855, page 128, together with an exact representation of the Cucumber, Sir Colin Campbell.

TWO NEW CUCUMBERS, SIR COLIN CAMPBELL and GENERAL CANROBERT, 3s. 6d. per packet, or a packet of each and a packet of either of the Melons mentioned in the advertisement of the above date (except Golden Drop and Scarlet King), for 6s.

TILEY'S SEEDLING POTATO, THE CHAMPION KIDNEY, the best and earliest in the world, price 5s. 6d. per peck, hamper and package included, or 1l. per bushel.

UNEQUALLED NEW MELON, GOLDEN DROP (Green Flesh), price 1s. 6d. per packet.

THE KING, a superb Scarlet Flesh Melon, 1s. 6d. per packet. A packet of Golden Drop, one of the King Melon, together with a packet of any other variety mentioned in the former advertisement, will be forwarded post free on receipt of 3s. 6d. in cash or penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somersetshire.

DILLISTONE AND CO., STURMER NURSERY, near Halstead, Essex, will supply the following at the annexed low prices:—

Remittances respectfully requested from unknown correspondents. Carriage of all orders above 20s. paid to London. Fine collection of Fruit trees, Seeds, &c.—March 3.

SUPERIOR GERMAN SEEDS WARRANTED.

JOHN WEEKS AND CO., King's Road, Chelsea, London, beg most respectfully to call the attention of their patrons to their very superior collection of German Seeds, Asters, Stocks, &c., which, having been grown, ripened, and selected under their own immediate care at their Branch Establishment in Germany, they can guarantee to be of the finest sorts and best quality. In order that ladies and gentlemen not possessing them from Messrs. WEEKS this season may be enabled to judge of the rare beauty of the different sorts in their splendid collection, they will be grown at Messrs. WEEKS' Horticultural Establishment, King's Road, Chelsea, where their patrons may make a personal selection for a future season.

For the general List of all other Seeds, see J. W. & Co.'s Seed Catalogue, and also their various Catalogues of Stove and Greenhouse Plants, Vines, &c. Also their Illustrated Catalogues on Horticultural Buildings and Heating by Hot Water.

The Horticultural Building and Engineering Department is near Sloane Square, Chelsea. The Nursery Establishment is near the Cremorne Gardens.

SUTTON'S LAWN GRASS SEEDS,

At the Crystal Palace, Sydenham.

SUTTON AND SONS *have had the honour of supplying to the Crystal Palace Company the Grass Seeds by which so many acres of Arable Land have been converted into the beautiful Park and Lawns, now so much admired at Sydenham.*

The following letter has been received, besides many others:—*From Professor Lindley, Horticultural Society, 21, Regent Street, London.*—"We have already made trial of your Lawn Grass Seeds, and it is only justice to say that they have proved the best we have sown for many years."

Price 1s. per lb.; 2s. 6d. per gallon; or 20s. per bushel. Quantity required for forming new Garden Lawns, 2½ bushels, or 50 lbs.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Great improvement may be effected by sowing 8 to 12 lbs. per acre of SUTTON'S Renovating Seeds, which consist of Perennial Clovers and Grasses of the finer kinds for improving the bottom.

An increase of several Tons of Hay per acre has been thus effected on many Meadows and Upland Pastures. The Seeds should be sown early.

The drought of last summer having caused partial failures in the ordinary Grass and Clover Leys, SUTTON'S Renovating Grass Seeds may be sown with great advantage *in all such cases.* PRICE REDUCED TO 9d. PER POUND.

SUTTON & SONS also supply Grass Seeds for laying down Land to Permanent Pasture at a moderate expense, the sorts being selected in accordance with the nature of the soil to be laid down, particulars of which may be obtained by post.

Goods delivered Carriage Free by Rail.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

CORNISH EARLY WHITE BROCCOLI, 1s. per packet, or 6s. per oz.

CONQUEROR OF THE WEST CUCUMBER, 1s. per packet, containing 12 good seeds.

The above can be had, warranted genuine, by forwarding postage stamps for the amount to

JAMES LAKE, Seedsman, &c., Bridgewater.

PELARGONIUMS OR GERANIUMS.

Also the best CUCUMBER in the world, the IPSWICH STANDARD, for table market, or exhibition. It is unrivalled, as proved by the numerous testimonials lately received. 2s. 6d. per packet.—Agents: the principal Nurserymen in England, Ireland, and Scotland.

VINES FROM EYES.—THE CHAMPION.

JOHN BUTCHER can with the greatest confidence recommend this truly noble Grape (but little known); it was raised at Warwick by the late Mr. W. Canning. Berries, extra large and globular; skin, thin; flavour, superior to the Hambro, and 9 days earlier. Plants 5s. 6d. and 7s. 6d. each Stock limited. Stratford-on-Avon, March 3.

VINES FROM EYES.—THE BLACK BARBAROSSA, THE LAST LATE GRAPE IN COVENT GARDEN MARKET.

JOHN BUTCHER can supply fine Plants of the above splendid late Grape. Plants, with well-ripened wood, stopped at from 5 to 7 feet. J. B. has been awarded Prizes for the above Grape by the Floricultural Society of London, at Regent Street, on the following occasions:—Oct. 19, 1852; Feb. 18, 1853; Feb. 21, 1854; and Feb. 6, 1855.

All the following varieties true to name:—Black Hamburgh, Black Muscadel, Black Tripoli, Black Alicant, Black West's St. Peter's (Oldaker's), Black Raisin, White Muscat of Alexandria, White Frontignan, White Syrian, White Malvaise or Grove-end Sweetwater, and Red or Grisly Frontignan.
Stratford-on-Avon, March 3.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

FIRST-RATE PELARGONIUMS AT LOW PRICES.

W. H. WHEELER, FLORIST, &c., Hendon, Middlesex, offers a choice of 12 from the following, at 21s. per dozen:—Carlos, Magnet, Medora, Optimum, Pilot, Enchantress, Mochanna, Sanspareil, Colonel of the Buffs, Governor-General, Magnificent, Sunrise, Village Maid, Supreme, May Queen, Virgin Queen, Basilisk.

SEEDLING CALCEOLARIAS (3000), from the collection of a first-rate grower, out of pots, at 2s. 6d. per dozen; in 4-inch do. at 3s. per dozen, good and strong plants.

CINERARIAS, just coming into flower, 3s. to 6s. per dozen.

HOPS SUPERSEDED BY THE BAVARIAN BITTER, a perfect substitute for Hops, of an agreeable flavour, quite soluble in wort or beer, saving the trouble of straining through a Hop-back, and giving to Beer the well-known keeping properties of the Bavarian Beer. Price of 1 packet, 2s. 8d., which is equal to 5 lbs. of best Hops.—Prepared only by THOMAS PRATT WILLS, St. George's Square, Portsea. Free per post.

BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Cinerarias in variety, Primula sinensis, Acacia armata, Deutzia gracilis, Erica Willmorea, &c. &c. The Trade supplied.—Dulwich, Surrey. March 3.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

GEORGE SMITH'S PRICED AND DESCRIPTIVE CATALOGUE of first-class Verbenas, Fuchsias, Geraniums (Show, Fancy, Variegated, and Scarlet), Dahlias, Chrysanthemums, splendid new Hollyhocks, very choice Petunias, &c., will be forwarded in return for one postage stamp.

The Geraniums are in extra fine condition, and require repotting. Parties giving orders immediately will save much in carriage, with less liability to damage by having them before they are repotted. Choice Verbena Seed from the finest show flowers.—Tollington Nursery, Hornsey Road, Islington, London.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

GREAT NOVELTIES FOR THE ENSUING SEASON,
FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

BASS & BROWN, Sudbury, Suffolk.

LATE WHITE SUPERB BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

SEED FLAX.

PAGE AND CO. have a splendid sample of about 150 Bushels (one year's growth from imported), saved with great care by GOVERNMENT AUTHORITIES. Sample and price upon application.

Seed Stores, Oxford Street, and Above Bar, Southampton.

ROSES.

GEORGE CLARKE begs to announce that he can still supply fine Standards of all the leading varieties, his own selection, at 18s. per dozen. Also, fine strong dwarfs of Perpetuals, Bourbons, Tea scented, &c., 12s. per dozen. Well varied collections of Evergreens, Fruit Trees, Coniferæ, and every article connected with the trade, at most moderate prices. Catalogues may be had on receipt of two postage stamps.—Nursery, Brixton Hill, near London.

NOW READY.

WILLIAM AND GEORGE DAVISON can supply complete collections of KITCHEN GARDEN SEEDS, to suit the various sized Gardens, at the following prices:—

No. 1 Collection ...	£3 0 0	No. 3 Collection ...	£1 2 6
No. 2 " ...	1 16 0	No. 4 " ...	0 12 6

FLOWER SEEDS: 50 packets, including the best hardy, half hardy, and tender Annuals and Biennials, with printed instructions, 10s. 6d.; 25 ditto ditto, 6s.; 12 ditto ditto, 3s.

GRASS SEEDS: Fine Lawn Grass Seed 1s. per lb.; Grass Seeds for laying down permanent pasture mixed to suit any soil, 30s. per acre. Every variety of agricultural Seeds of the finest quality. Priced Catalogues may be had on application to W. & G. DAVISON, Seed Warehouse, St. Peter's Street, Hereford.

"THE CATALOGUE OF SEEDS *sold by* J. C. WHEELER AND SON, of Gloucester, *appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short, select Seed List, to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish.* Messrs. WHEELER'S *little book will do something to satisfy their expectations.*"—Gardeners' Chronicle.

J. C. WHEELER & SON will forward a copy of their Catalogue post free on receipt of two postage stamps. They can most confidently recommend the following collections of Garden Seeds, as comprising the most select sorts, and such that they feel sure will give entire satisfaction.

No. 1. A complete Collection, suitable for a large Garden	£3 0 0
No. 2. A Collection of equally choice varieties, but smaller quantities	1 10 0
No. 3. A Collection suitable for a small Garden	0 15 0

These Collections will be sent Carriage Free to any Railway Station within 200 miles of Gloucester.

J. C. WHEELER AND SON, SEED GROWERS, Gloucester.

SEEDS CARRIAGE FREE.

SUTTON'S COLLECTIONS OF SEEDS.—A Clergyman, whom we have had the honour of supplying many years, writes us:—"*I have much satisfaction in recommending your Seeds to various friends, as I find they are much pleased with them;*" and another purchaser says, "*I never received so numerous a Collection, so good in quality, from any house.*"

We therefore confidently recommend those gentlemen who are not themselves acquainted with the best sorts of Vegetables, to order immediately (while we have a large Stock), one of the undermentioned complete Collections:—

KITCHEN GARDEN SEEDS.	£	s.	d.
No. 1. A complete Collection, for one year's supply ...	3	0	0
No. 2. A complete Collection, in reduced quantities ...	2	0	0
No. 3. Ditto Ditto Ditto	1	5	0
No. 4. Ditto Ditto Ditto	0	15	0

SEEDS FOR IRELAND, SCOTLAND, AND WALES.

SUTTON AND SONS having many customers in North and South Wales, Scotland and Ireland, whom they have supplied with Agricultural and Horticultural Seeds for many years, are well acquainted with the sorts which thrive best in each locality.

SUTTON & SONS *deliver their Goods Free of Carriage to the Seaports, and many other parts of Ireland, Scotland, and Wales. For particulars, address*
JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, MARCH 3, 1855.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, March 6—Horticultural ..... 2 P.M.

PAPERS relating to the REORGANISATION of the CIVIL SERVICE have been just laid before Parliament. The territory belonging to the *Gardeners' Chronicle* may be said to include the Woods and Forests only; but in our complicated system of government all branches of the service are so nearly connected that it is difficult for a critic to confine his comments within very narrow limits. If, therefore, the following remarks shall be found to bear upon matters not immediately within our scope, we must ask for the indulgence of our readers.

In the year 1853 Sir CHARLES TREVELYAN and Sir STAFFORD NORTHCOTE, two most able and experienced civil servants, were directed to report in what manner admission to the Civil Service could be regulated so as to secure a more universally good class of public officers than is provided by the existing system. We presume that the report was called for with a view to the extinction of that *improper* exercise of parliamentary and

family influence, which is universally known among us by the name of jobbing, and which under our present vicious arrangements seems to be inevitable. These gentlemen avow that the public service suffers both in internal efficiency and in public estimation from the existing system of admission by favour, and they do not hesitate to ascribe to it the complaints that are made of "official delays, official evasions of difficulty and official indisposition to improvement." How far this opinion is supported by facts known to all men we need not say. The Woods and Forests afford as much evidence as to the truth of the allegation as any reasonable person can require; and Sir James Stephen, who was so long in a high position in the Colonial Office, entirely confirms the statement. He declares that when he quitted office seven years ago, the gentlemen employed under him "were clearly distinguishable into three classes; the first, a very small minority; the second being more numerous than the first; and the third *exceeding the number of the others united.*" Of these the first were men of the greatest ability and energy, the second were meritorious, while the third was "made up of persons of whose official characters nothing but the obligation which you have imposed upon me would induce me to speak at all." These last were "without exception, men who had been appointed to gratify the political, the domestic, or the personal feelings of their patrons; that is, of successive Secretaries of State." When we are told by men of such standing as Sir Charles Trevelyan, Sir Stafford Northcote, Sir James Stephen, and others, that the Civil Service of the country is in such hands, it is impossible not to feel that honourable exceptions, however numerous, can have little effect upon a body of between 50,000 and 60,000 persons, and we see at once the history of our bungling blundering Civil Service in the Crimea.

It is right to say that Mr. George Arbuthnot, also a high civil officer, does not admit the existence of such a state of things, and without much regard to official courtesy gives it a flat denial. But it will be seen by readers of the "Papers" that every point upon which he has ventured to make a stand is shown by positive evidence to be untenable, and that the assertions of the Government Court of Inquiry, if it may be so called, remain unshaken. This will surprise no one who recollects that it was this very Mr. Arbuthnot who maintained before Mr. Drummond's Committee, that he saw nothing wrong in the management of the Woods and Forests, and who from anger dropped to pathos when he adverted to the facility with which any public department might be run down; another opinion from which we presume to differ:—the truth being that no public department can be "run down" until its mismanagement becomes utterly indefensible. The *Times* has plainly declared, as the result of its own experience, that—

"The officials of our public establishments seem to think not only that they may do wrong, but that it is an unwarrantable presumption in any one to set them right. The same spirit has been visible through the whole period of the war, nor is there, we believe, a single one of the examples of mismanagement, now flagrant and confirmed, which was not denied or disputed as long as dispute was possible."

In order to meet difficulties of so great a magnitude, it is proposed that no person whatever shall be admitted hereafter into the Civil Service unless he shall have passed certain examinations, and a period of official probation. To this principle there is nothing to object. If honestly and skilfully worked out it should extinguish the whole system of improper appointments; by which we mean appointments without qualification, or in spite of disqualification. It is not patronage, it is not nepotism, it is not influence that reasonable men object to, provided they are honestly exercised. In a country like this wealth, political power, or high rank, will, we trust, always have their legitimate weight. It is only when they are executed improperly that they require to be checked. The world does not object to Mr. Fitzburgh, an idle young scamp, because he is placed in office by the Duke of Hereford; the objection is taken to his unfitness; the appointment would have been none the better had he been the nominee of a tailor. Why have we objected to the appointments of Forest officers? Certainly not because their places were procured for them by Lords and Earls, and members of Parliament, but because they were wholly ignorant of the duties they had to perform. A sufficient previous examination would have prevented such reckless sacrifices of public interest.

Previous examination and probation are sound in principle, but they must be suited to the occasion. And this leads us to inquire whether the plans suggested by Sir Charles Trevelyan and Sir Stafford Northcote will really answer the end proposed. Upon this some differences of opinion are certain to be entertained.

Of what is the proposed examination to consist? It is to be "in all cases a competing literary examination," and this is elsewhere explained to signify an extensive range of acquirements in history, jurisprudence, political economy, modern languages, political and physical geography, and other matters, *besides the staple of classics and mathematics*:—rather a tough affair for a gentleman aspiring to become a clerk with such miserable pay as the Civil Service offers to the mass of its officers. The examination is, however, to be modified to suit the exigencies of special departments. We own that we agree with those who think such a system not likely to work satisfactorily. What we want in our public offices are well-educated, active, intelligent men of business, and it is questionable whether success in any competing literary examination will secure such a class. We should say the contrary. Let us take the case of a man who has gained the highest honours at an University; he would doubtless stand high in the proposed official examination; but it by no means follows that he would make a good public officer. He might want method, good business habits, knowledge of the world, and a practical acquaintance with the subjects with which he would have to deal officially. Place such a man in a situation commensurate with the literary attainments he shall be found to possess, and the chances are that he will break down. Examples of officers of state, and high officials, possessing, no doubt, far more literature than any board of examiners could require, being totally unfit to conduct the business of a public department, are unfortunately too recent as well as flagrant to leave any doubt upon the point. Such men fail, not for want of literary attainments, but because they want clear heads, business habits, and a knowledge of common things, as well as the decision, firmness, and moral courage necessary to render the other qualities effective. Nelson would have broken down in the presence of a literary examination, and yet what a war minister would he have made! Or if we look at what is, instead of what might have been, we shall find some of the very best of our civil officers by no means distinguished for literary attainments. Or let us take the case of a deputy-surveyor in a Royal forest; would proficiency in Greek and Latin stand him in any stead? He would not learn either the art or science of forestry from the Georgics or the Geoponic writers; though he might from English, French, and German books, the very names of which would be to a board of examiners unknown.

Possibly such a modification as is suggested by the Chairman of Inland Revenue might meet these objections; indeed, it is evident that without some such change as Mr. Wood suggests, the system of examination would lead to no useful result; for if it killed the inefficiency which comes of patronage, it might revive inefficiency by erroneous education.

We think that the head of each department should have absolute control over the appointment, discipline, promotion, and dismissal of the persons employed under it, subject to certain rules of universal application, exactly as is the case in a great public company. The head of the department should settle the kind of examination and probation which its peculiar nature may require; and a general board of examiners should be called upon to examine candidates in the subjects prescribed by the head of the department, and in no other. But the head of the department should not be the removable political head; he should be the permanent working chief. The Treasury should be itself deprived of all patronage except that which it could claim in common with any other department; and its permanent chief should be the only officer with power even to settle the line of examination to which candidates for appointments in the Treasury should be subject. The permanent head of a department knows what is required; he should be made heavily responsible for the good working of his office; and if he were able to promote good men, remove bad ones, and settle what qualifications his rank and file should possess he would, we think, soon take as great a pride in the excellence of his office as a good Lieut.-Colonel does in the discipline of his regiment. The system would require to be surrounded by certain precautions, no doubt, but men who have the conspicuous talent shown in drawing up the papers which have led to the present remarks, would have no difficulty in guarding the system against abuse. We should have an end to scandalous appointments, and obtain fair security against their recurrence. The clamour which has been raised against what are not very fairly called aristocratic influences, by which is really meant Parliamentary jobbing of all kinds, would be at once put down; the aristocracy would contend in honourable rivalry with the democracy, and if the former fairly won, the latter would no longer complain.

We see with amazement that a minute portion of the newspaper press is protesting against men being dismissed for inefficiency, and crying out upon the hardship which individuals must suffer. Those who write thus can have no real wish for the reform of the Civil Service. Others, however, who, like ourselves, represent the public interest, will listen with little sympathy to such appeals, and deny that any one would be used unjustly if deprived of duties which he cannot fulfil, and for not doing which he has already been allowed to plunder the public purse. It is because official dismissals are so rare that official incompetency is so common. We engage to say that as the former increase the latter will diminish, but in an accelerated ratio. Under circumstances thus altered, it would not be possible for any future board of inquiry to introduce into their report such a paragraph as the following:—"We have before us," say Sir Charles Trevelyan and Sir Stafford Northcote, "the testimony of an eminent public officer who was for many years connected with one of the chief departments of the State. He writes thus:—During my long acquaintance with the —— office I remember four, *and only four* instances of young men being introduced to it on the ground of well ascertained fitness. I do not venture to mention any names, but I confidently affirm that the superiority of those four gentlemen to all the rest was such as to extort the acknowledgment of it from their rivals, and to win the high applause of each successive Secretary of State." After such an avowal who can wonder at the calamities that have of late befallen us, or expect them to be averted for the future until jobbing is crushed, and the whole race of worthless nominees returned upon the hands of their patrons as discarded public servants?

Last Tuesday Sir John Shelley brought on in the House of Commons his motion for a select committee to inquire into the grounds upon which the Right Hon. T. F. Kennedy was dismissed from his office of Commissioner of H. M. Woods and Forests. The ex-Chancellor of the Exchequer, from whom the dismissal came, defended his act in a speech, the precise meaning of which we fail to discover, and in which the statements of most public interest were two—the first that he, Mr. Gladstone, was the only person responsible to the House for the management of the Crown estates, and the second that "not one word or syllable had ever been said by members of the Government which Mr. Kennedy could imagine to touch his honour, his veracity, or his integrity." Mr. Wilson also disavowed, on the part of the Government, "in the most ample manner" that any such imputation had been ever made. And yet unless our memory deceives us strangely, the ground of the Right Hon. gentleman's dismissal was declared to be that a Treasury tribunal had reported unfavourably upon a question, relating to Mr. Brown and Mr. Kennedy, in which, as the Treasury then asserted, were involved the veracity, honour, and character of the parties.* Upon this mode of meeting complaints comment is superfluous.

The temper of the House was, however, so obviously hostile to Mr. Gladstone, and speeches by Lord Stanley, Mr. Malins and others told with such force upon the act of dismissal, that a Committee would have been inevitable had not Lord Palmerston come to the rescue, and undertaken that there should be placed on the records of the Treasury a full acknowledgment that Mr. Kennedy stood fully unimpeached. And so the matter ended.

New Plants.

116. Thyrsacanthus barlerioides, *Nees ab Esenb. in DC. Prodr.* xi. 323. *Planchon in Van Houtte, Fl. des Serres, t.* 986.

Why this is called Barleria-like we are unable to comprehend, unless upon the principle of *lucus a non lucendo*. It is a broad-leaved Brazilian shrub, with a close thyrse of long, slender, deep crimson flowers, which are very handsome. Dr. Planchon says it has the appearance of a herbaceous plant, scarcely woody at the base, with an

---

* The words of the Treasury minute of March 31, 1854, are these:—"In the case, however, of the controversy which has arisen between Mr. Higginbothom and Mr. Brown, and also between the former gentleman and Mr. Kennedy on the subject of Mr. Brown's reports on Alice Holt and Woolmer Forests, the questions at issue are reduced to matters of simple fact, but which, from the spirit in which the discussion has been conducted, have assumed a character involving the veracity, integrity and honour of the parties." If there is any meaning in Treasury minutes we have here an assertion that the veracity, &c., of Mr. Kennedy, as well as of Messrs. Brown and Higginbothom, for all were parties to the controversy, are involved. Yet this is what Mr. Gladstone and Mr. Wilson assured the House of Commons was never said!!! We observe in the *Times* that late in the evening Mr. Wilson attempted to reconcile the fact and his assertion; but we are unable to discover by what process it was proposed to effect this desirable object.

upright simple or forked stem, 1½ to 3 feet high, clothed to the base with great, light green, membranous leaves. It was first seen in the garden of San Donato, at Florence, in the collection of Prince Demidoff. Mr. Van Houtte now possesses it. Its native country is said to be the province of Minas Geräes in Brazil. In the hands of English gardeners we have no doubt that it would prove a species of much beauty.

A ROYAL FOREST.

In passing through Whittlewood forest the other week, I found by the auctioneer's mark apparently on every tree worth a shilling, that it is going to be disforested in earnest. So far, so good, and though now too late to retrieve the past as regards the trees, it is not too late to let the country know the disgraceful manner in which its property has been managed for nearly two centuries. Including Silsoe, I believe there are about 6000 acres of excellent land under forest in the county of Northamptonshire, and according to the account published in your columns, they have been costing the country within the last twenty years some 10,000*l.* above the returns, for mismanaging it. But how can it be otherwise ?—the Duke of Grafton claims all the underwood, and I believe up to his time his forefathers claimed all but the Oak timber ; it was, therefore, their interest to grow underwood and not Oak, and they have not lost the chance of doing so.

I send you a rough sketch of the forester's system of pruning, practised for I believe nearly two centuries, apparently to the satisfaction of John Bull. You will see by it, that even the few straggling Oaks (many of which must have stood there in Charles II.'s time, and are 12 feet and upwards in circumference containing upwards of 200 feet of timber) are completely mutilated to afford pasturage for the deer and allow the underwood to grow. Had this race of managers for the public done their duty, these Oaks (a century past their best, and now of no use for ship-building) would have been cut down long since, and the ground properly prepared and replanted with Oak (and Larch, the latter as nurses) and might have been bringing in the country at least 6000*l.* annually. Since many thousand acres of forests are still in the hands of the country, and are, generally speaking, not much better than the above, I trust they will not be allowed to remain so. I think it is quite time to put aside the razor, and lay the more powerful weapon the axe to the roots of this much-abused branch of the public property. As the trees in Whittlewood Forest will not be cut down till May, any one who imagines that my sketch is in any way exaggerated has still an opportunity of satisfying himself in the matter. *David Ferguson, Stowe, Buckinghamshire.*

VEGETABLE PATHOLOGY.—No. LXI.

272. Apostaxis. *Constitutional and Organic or Accidental.* 3. Discharge of resinous fluids.—Like gum, resinous fluids are deposited in particular cavities, or are to a greater or less extent mixed up with the general circulating medium, from which it is necessary that they should be eliminated when present in greater abundance than is consistent with health. In some cases, as in the Silver Fir, the Cowdie and Kauri Pine, &c., the resinous matter flows naturally, hardening on exposure to the air ; and to a small extent the same may be said of most resiniferous plants ; but in other instances no great discharge takes place without accident or artificial incision. The quantity of matter discharged varies immensely ; while in Pistacia Terebinthus (the Chian Turpentine Tree) it amounts to only 10 or 12 oz. in the course of the year, in some of the Indian Varnish plants, as Dipterocarpus, Shorea, Melanorrhea, &c, the quantity is prodigious,* without affecting in any sensible degree the health of the plant. There are, however, in some cases limits to the demand which can safely be made on the plant: "A strong and vigorous Spruce Fir," says Loudon, "will yield every second year from 40 to 50 lbs. of congealed resin ; and this may be collected for from 20 to 25 years, if no other value is set upon the tree ; but if the collection of the sap be continued for this length of time the tree becomes rotten and decays, giving birth to myriads of insects, which seriously injure the surrounding trees. It is therefore better to cut the trees down after extracting the sap for 10 or 12 years, because the wood may then probably be used for packing boxes, and at any rate will be good for fuel and charcoal." Similar cautions are given by Hartig. In Thuringia and Franconia the disastrous consequences of an over-greedy demand for resin are notorious. The trunks from 8 to 10 feet high are so bad that they can scarcely be sold at the price of firewood. Moderate bleeding is attended by no evil consequences, especially if the trees are allowed to rest every alternate year. If such precaution be not taken, they soon assume a sickly aspect, the growth becomes dwindled, the seeds do not come to perfection, and death ultimately ensues.

* In Oreodaphne opifera a volatile oil is produced in immense quantities by merely making an incision into the bark with an axe as deep as the liber. It gushes out in such quantities that several quarts may be obtained from a single incision. In the Shoreas and other allied trees several feet of the trunk from the ground are often covered with a crust of resin.

273. A discharge of resinous matter is not so likely to be injurious to a tree by inducing decay as gumming, because it has a tendency rather to exclude than admit outward atmospheric agencies which might prove injurious to the ruptured tissues. It may, however, be complicated with gangrenous disease. In shallow ill-drained soils, with an impervious substratum, where the ground is alternately water-logged or extremely dry, extensive disease sometimes prevails amongst Conifers, the bark cracking in the first instance from drought, and then affording a perennial outlet for the resinous sap ; or in case the discharged sap hardens into a compact mass of resin, through which nothing can pass, the circulation is impeded, and the tissues swell around the original wound, producing unsightly tumours. In these cases where the disease is very aggravated, decay is the sure consequence, but where the injury is but slight, genial seasons may effect a cure, or what is far more effectual, the roots may at length penetrate the barrier, and convey a more regular and better supply of nutriment, under the influence of which the more healthy tissues may overgrow and ultimately obliterate the diseased patches. Where the subsoil is absolutely impervious the plantations will never recover, and the profitable growth of timber is altogether hopeless. In some cases, as in Liquidambar styraciflua, the liquid balsam is collected principally from fissures in the bark, through which it exudes from accumulations between the bark and wood. Occasionally the flow of resinous matter in Conifers is so great that the stream extends from the trunk to the roots, where it at length finds an exit, and in consequence protrudes into the surrounding soil large amber-like masses of resin.

274. Besides the cysts in which resinous matters are usually contained, which themselves vary considerably in size and form, and though having no proper tissue of their own are closed with a wall built up of regular cellular tissue, more or less distinct from that which surrounds it, there are in some cases irregular cavities which contain large quantities of such production, comparable to the accumulations of gum in the trunks of Cycads. In the trunk of Dryobælanops Camphora, for instance, vast cavities or fissures sometimes exist, as in a case from Labuan, described by Mr. Motley (see Hook. Journ., 1852, p. 201), in which five gallons were saved from one cavity, though much was lost. From this the camphor itself is deposited in crystals on the walls.

275. Sometimes on the contrary, the turpentine penetrates by infiltration into every part of the wood, even those which in general are free from resinous matter. Wood in this condition is called by the Germans Kienholz. It is probable that in such cases there is a defect of vitality in the cell walls, in consequence of which the turpentine is distributed according to mere dynamic laws. It is well known that dead branches of Pines inclosed in living wood are strongly impregnated with turpentine, and acquire, in consequence, an extreme degree of hardness ; and such is more or less the case with all the other portions of the wood. The punctate woody tissue and the medullary rays are equally affected ; their membrane itself is saturated, and the intercellular passages are gorged with resin. The affection is either general or partial, and is sometimes confined to the tops of the branches, which are then known in Germany by the name of Kienzöpfe. The wood, however, for many purposes, is not deteriorated by this process, but acquires a high degree of durability, and in consequence is much valued by mechanists. The roots of Fir trees gradually acquire a similar condition, and are dug up in ancient forests after the expiration of hundreds of years and used as torches, from the immense quantity of resin which they contain. *M. J. B.*

DRACOPHYLLUM GRACILE.

This is a remarkably useful plant, and, under good management, it soon forms a pretty specimen. Its little heads of white flowers, with which every shoot is crowned, have a very pleasing effect and last a considerable time in beauty. Although not very difficult to propagate, this part of its culture had better be left to nurserymen; for the propagation of any hard-wooded plant is a work which requires time and careful attention, and good, strong, well got up, young plants may be procured for a trifle.

To begin, let us suppose that a couple of nice bushy, healthy young plants are procured at once with which to commence. Those that are dwarf, bushy, and strong, and neither under nor over-potted, should be selected. When received let them be placed in a close part of the greenhouse, where they will be near the glass and out of the way of cold draughts, giving water to the soil very carefully for the present. About the beginning of March, see to the state of the roots, and if these are found to require more pot-room, shift at once into pots a good size larger, using prime rich turfy peat broken up rather small, and well intermixed with plenty of sharp silver sand and some lumpy bits of charcoal, to ensure the soil being permeable by water. Secure perfect drainage by placing plenty of potsherds in the bottom of the pot, and in potting make the fresh soil rather firm about the ball. Place the plants after potting in the warmest part of the greenhouse close to the glass, or in a pit where the night temperature may be kept at about 45°, keeping them rather close during the day, to encourage the roots to strike into the fresh soil. With proper care to have the ball and soil used in a healthy state at the time of potting, very little water will be necessary for some time after potting, but the plants should be dewed over head with the syringe on the afternoons of clear days, taking care also to secure a moist state of the atmosphere by frequently sprinkling any available surface. But, although over-watering must be avoided, the opposite extreme would be nearly as injurious, therefore when the soil requires water, and only then, give a good soaking, avoiding dribblings, or waterings when it is not absolutely required. In course of a month or so after potting, the roots will probably have got hold of the fresh soil, and as soon as this is apparent, cut back any straggling shoot, stop the others, and train them nicely, bringing them well down to the pot, and keeping them thin. The object after this should be to get the plants to break as thickly and strong as possible, and this will be best secured by keeping them near the glass, giving air freely on fine days, keeping close when the weather is cold, and the atmosphere can hardly be kept too moist. When the weather becomes mild, remove them to a cold frame, which is the best situation for them in summer, and use a thin shade on the forenoons of bright days, but not until it is wanted, for too much shading is productive only of long-jointed weakly wood. As the young shoots advance in length train them out to neat thin made stakes.

A second shift will probably be wanted towards June, and this should be attended to as soon as the pots are full of roots, in order to avoid checking the plants, and also to get them well rooted into the fresh soil before winter. Use similar soil, &c., to that recommended for the last shift, and keep the plants rather close for a fortnight or so after repotting. In summer every precaution must be used to secure a moist state of the atmosphere, for except this is attended to strong rapid growth will not be obtained; and, perhaps, the best way of effecting this is to place the plants on a bed of coal ashes, which, by sprinkling in fine weather, can be kept continually moist. Give air freely on fine days, but guard against drying winds by giving air sparingly, and on the sheltered side of the light keeping down the temperature by shading. Sprinkle the plants over head early in the afternoon, and keep them close for the evening, but air should be given freely for the night; and after the middle of July the lights may be thrown off in the evening, so as to expose the plants to the night dews, replacing them in the morning before the sun becomes powerful.

A drier system of treatment must be pursued in autumn, in order to get the wood well ripened for winter, and the plants should be removed to a light airy part of the greenhouse for the winter. The same treatment pursued a second season will produce nice little specimens, which will be useful for flowering, and in this case they should receive the ordinary greenhouse treatment until they come into bloom, when they should be slightly shaded, to prolong the beauty of the flowers. As soon as their beauty is over, cut back the shoots sufficiently to ensure a compact growth, and remove the plants to where they can be afforded a moist atmosphere, keeping them close to the glass, but not too warm, in order to induce them to break close and strong. As soon as they fairly start into growth, give a shift if the roots are found to be in want of more space, which will be the case if all is right. Attend to training the shoots as may be necessary, and treat them during the remainder of the season as already recommended. With care in watering, &c., the plants may be expected to last many seasons, and form fine large bushes; but it will be safe to be prepared for the loss of a specimen occasionally by having a succession of young plants. The compact heads of white flowers are very suitable for bouquets, in which they are much valued, and their removal for this purpose improves rather than injures the plant. *Alpha.*

COMMON THINGS.

Asparagus.—Now that the weather has changed Asparagus beds will require early attention, as the plants will soon commence growing. Presuming of course that they have been top-dressed with rotten manure or some light rich compost before winter set in, this should now be mixed with the surface soil by forking it lightly over, taking care of course not to go deep enough to injure the crowns of the plants. After the operation of forking, a moderate dressing of salt may be given, and when the newly broken up soil has been acted upon by the atmosphere sufficiently to allow of its being neatly raked, this operation may be performed, first shovelling up the loose soil out of the alleys and spreading it over the surface of the bed. The beds being neatly edged another dose of salt will ensure the beds in a great measure against weeds. Before these matters are attended to it is advisable to take up as many plants as will be required for forcing, and cover them with old tan or something similar, which will preserve them from frost without exciting them.

Seakale.—It is a common practice to throw away the old roots of Seakale that have been taken up and forced; but it is a pity this should be the case, as if taken care of they will produce fine plants for another year with very little trouble. After the "Grass" has been cut, which should be done without injuring the crown, the plants may be laid in carefully in some sheltered out-of-the-way spot, until a half spent hot-bed frame is at liberty, with a surface soil of leaf and sand. The roots may now be cut into pieces 2 or 3 inches long, and after dusting them over with quick lime they may be planted all over the frame 3 or 4 inches asunder. The frame should be kept rather close for a few weeks, and by the time the season will admit of it the plants will be in a nice condition for removing to some rich well trenched ground, and having all the summer before them will make fine strong plants by autumn quite equal to what two-year-old seedlings generally are.

Home Correspondence.

Grafted Rhododendrons.—Being one of the advocates for grafted Rhododendrons, I think it right to observe that I have had no desire to adopt that "Irish" species of defence which "J. R." attributes to them. My object from the commencement has been to state in a straightforward manner my reasons for considering some of his statements erroneous, and I have advanced nothing but what my own observation and practical experience prove to be correct. I have recommended grafted Rhododendrons for standards, as I consider them better calculated to make handsome specimens than plants propagated from layers, and this in a much shorter time; I only stated the fact of its being possible by deep planting to induce the scion to emit roots, and become independent of the stock, as a secondary argument, and with the view of helping "J. R." out of his supposed difficulties. I do not wish to deny that stocks, even though weaker than the scion, will not occasionally throw up suckers, but I hold that even when this does happen to its greatest extent, it is but a small evil, and easily remedied by common attention; it is an evil too which gets less every year, and when the scion has gathered strength will disappear altogether. I am, however, perfectly aware that some skill is required in the selection of proper stocks for different varieties, but this is never overlooked in an establishment where the proprietor has an eye to his own interest. In endeavouring to refute my assertion that Rhododendron ponticum and maximum are more luxuriant than their hybrids crossed with arboreum, "J. R." seems to be unacquainted with the parentage of the hybrids, which he names as examples; R. Russelianum is not from caucasicum, but from some of the varieties of catawbiense crossed with arboreum, and it illustrates very well the truth of my statement that hybrid Rhododendrons almost invariably assume the habit of the female parent; but the hybrid obtained from caucasicum crossed with arboreum, and known as Nobeanum, furnishes a more perfect illustration; here we have the dwarf habit of caucasicum, and the foliage far more like that variety than arboreum, and many more examples could be named in support of this point. As regards my assertion that hybrids raised between hardy and tender sorts will not be hardy unless the seed is saved from the hardy sort, I may state that, before trying the experiment myself, I had the testimony of two or three practical hybridisers of extensive experience. And I have since proved it for myself in the case of a batch of hybrids, in which the seed was saved from a tender sort, all of which suffered from frost, while those from the same parents crossed *vice-versâ* have stood uninjured. *Hugh Fraser, Stanwell Nurseries, Edinburgh.*

Snow a Protector of Vegetation.—Your observations at p. 99 remind me of the protection afforded by snow to vegetation in the neighbourhood of St. Petersburgh. On the melting of snow there I noticed in a large field that the last year's Grass, and many weeds mixed with it, remained green, excepting that the ends of the leaves were frost-bitten; young shoots were even sprouting out between the old stems. The preceding winter had been unusually long and severe; on one occasion Réaumur's thermometer marked 25° of cold about noon; it had been as low as 36° the preceding night, being equal to 35½° below zero of Fahrenheit. Market gardeners seemed to avail themselves of the protection snow affords, for at Ochta, near St. Petersburgh, I saw a man sowing Peas on prepared ridges whilst snow was still on the ground around them; after drawing earth over the seeds, he covered the ridges with a thick coat of snow. Rarely in this country is there enough of it to protect the soil beneath from frost; but might not this practice serve as a hint to our gardeners? Might not they spread some waterproof material over tender plants or seeds? Old nets have long been sold for nailing against walls, old carpets would form excellent protection if previously coated on one side, with tar for instance. *B.*

Temperature.—In your Paper of Feb. 24, p. 115, you give a table of the extremes of cold since the year 1813 or 1814, but in the column Extreme Lowest against the years 1819 and 1820 are three dots, thus ...; also in 1822 and 1823, and again in 1855. May I ask whether this means above zero? [Yes; the dots have been put in merely to fill up the space.] All the other years have the minus sign —, meaning, I suppose, below zero. [Yes, in the usual way.] The following table, copied last year from one of the leading journals, may perhaps be useful. It is by Mr. Lowe, of the Highfield Observatory:—

1810—February 21...	12°	above zero.	1826—January 15...	11° above zero.
1814—January 9...	4	"	1830 " 19...	10 "
" " 13...	3	"	1836 " 20...	7 "
" " 14...	5	"	1841 " ...	4 "
1815 " 33 ...	11	"	1845—March 14...	13 "
1816—February 9...	2	"	1854—January 3...	4 below zero.
1820—January 1...	6	"		
1823 " 19...	6	"		

On 14th March, 1845, temperature fell to 1° below zero on the Grass.

On the 3d January, 1854, the thermometer on the Grass was 6° below zero by several thermometers; at 4 feet above the ground it was 2° below zero.

The year 1829-30 was a very severe winter, but none of the tables I have seen seem to notice it. The river Medway was then full of ice. [In that winter the thermometer gave the following results for the 31 coldest days:—

1829—1830	Mean max.	Mean min.	Mean.	Lowest extreme
Dec. 20 to Jan. 19	34·12	25·80	29·99	Jan. 18th 10°.

The period was remarkable for continued low, but not extremely low temperature.] On Feb. the 10th inst. we had the thermometer at 5° above zero here. *Fred. B. Hankey, Fetcham Park, Surrey, Feb.* 25.

Discrepancies between Thermometers at different Elevations.—At p. 115 you make a comparison between the observations at Chiswick, during the late severe frost, and those of Howard, for the frost of 1813-14, as given in his "Climate of London." Now, a comparison between two instruments can only be strictly true when the elevation of those instruments is identical; and I can prove that there was a difference between the elevation of Howard's instruments and those at Chiswick amounting to no less than 9 feet, as regards the minimum thermometer. When I wrote to you on this subject in March, 1852, you inserted a sketch of the positions of the instruments at Chiswick in your Paper of March 13, which I have now by me. In the explanation of the diagram you say, "The minimum thermometer is about a foot above the surface of the ground," consequently within the influence of radiation, and indicating with precision the temperature to which vegetation is exposed. But Howard's observations seem to have had no reference to the science of horticulture. If you refer to the "Climate of London," vol. i., page 4, in the article on temperature, you will see that Howard's instruments during the frost of 1813-14 were suspended no less than "10 feet from the general level of the garden." Now it is a known fact that the temperature, 1 foot above the ground, is always lower than at 10 feet elevation, so that observations conducted at this height, though valuable as a record of weather, are worthless as regards the effect of frost on vegetation. As a proof of the discrepancy between two instruments of different elevations I may mention that on January 10 of this year, one of my thermometers (a), 6 feet above the ground indicated at 8 A.M. 24°, while another (b), 20 feet above the ground, registered 29°. On the 19th (a) was 1°, while (b) was at 17°. Here, 8° has been the lowest point reached by (a), 9° by (b) on Feb. 18. If observers would make it a rule to give the elevations of their instruments as well as their readings, a comparison might be instituted on strict principles, and the cause of meteorology and horticulture be much benefited. *C. B. N. P., Stevenage, Herts, Feb.* 26.

"Dommiska" Apple.—Mr. Hogg mentions, in his work on "British Pomology," a foreign Apple under the name of "Dommiska," amongst the list of those with which he is imperfectly acquainted. Can your correspondents give me any certain information respecting the Apple so called? From the description given of it, I suspect it is the same as an Apple which I met with in Wallachia, where it was called the "Domm-

neshti" Apple (this difference in name would be merely the natural change into the common form of names in the Wallachian language). If it be the same, I can answer for its quality being of the very finest in Wallachia, where I have eaten it in the latter part of October. It was then fully equal, if not superior to any Apple I have ever tasted, somewhat similar in appearance and quality to a very large and well-ripened Ribston Pippin. *C. W. Strickland, Wassand.*

Scottish Arboricultural Society.—In your notice of this new Society, at p. 100, you say that "it is but just to the veteran Billington to state that this (formation of such a Society) is a measure of which he has been the advocate ever since you remember his name." Now, if your knowledge of Mr. Billington only began with the advent of the *Gardeners' Chronicle* in 1841, I take it for granted that another has a prior claim to the merit of suggesting the propriety of establishing an association for the improvement of Forestry; for those who possess copies of the "Gardeners' Magazine" will find, in the October Number of 1833 of that work, that the utility of forming such an association is insisted on at considerable length. *A Forester, Easton Maudet.* [What then?]

The Winter in the North; at Jedburgh, N. B.—On the morning of the 15th ult. we had the thermometer down to zero, and on that of the 17th 4½° below that point. This was at 5 o'clock A.M. At 8 o'clock on that morning it was 3°, and at 2 o'clock 2° below zero. The snow around the town has been a foot deep. Jedburgh is situated in a finely sheltered valley, so that in some localities near us the temperature would doubtless be more than 4½° below zero. In a place not a mile and a half off the thermometer indicated 9° below zero on the 17th at 8 o'clock, A.M.; and I believe it would be perfectly correct, as it was the standard instrument by which the owner, one of the most eminent makers in the north, used to regulate all his thermometers. We shall experience a fearful loss of plants; bushes of Aucuba japonica are as black as coal, all my Noisette Roses, the very hardiest of them, and plants covering a great space of wall are killed to the ground. The loss in standard Roses will be considerable, and I should think the whin (Furze) fences, unless saved to some extent by the snow, must be ruined. *William Deans, Anna Nursery, Jedburgh.*——An ordinary registering thermometer fell here as follows:—Feb. 15, 11° below zero; Feb. 16, 16½° ditto; Feb. 17, 20° ditto; and on the 19th 4° below zero. The above occurred between 6 and 7 o'clock in the mornings. *Charles Kay, Blackadder, Dunse, Berwickshire.* [What is here meant by the expression below zero! or has the writer a thermometer that misleads him!]

Water Rats.—Having been rather an extensive planter, on low ground and near a running stream, and having been much annoyed by water rats barking the young trees (about six inches from the ground) quite round the stems, and completely destroying them, I am induced to ask whether you can point out any effectual plan for killing these animals, except by shooting them, which is a very tedious operation; the professed rat-catchers will not undertake to extirpate these aquatic pests. *A Subscriber.* [We destroyed or drove away all ours, in 1838, by laying phosphoric rat poison in their runs.]

Societies.

LINNEAN, *Feb.* 20.—The President in the chair. Among the objects before the meeting were three varieties of Rice from the kingdom of Nyami, Upper Gambia, together with the fruits of Amomum Danielli, cereum, latifolium, exscapum, and grana-paradisi, from Western Africa, presented by W. F. Daniell, M.D. The following communications were read:—1. A letter from Mr. E. D. Lockwood, of Haileybury College, Hertford, recording the occurrence in that neighbourhood during the late severe weather, of the red-throated diver, and the little auk, both killed between Ware and Hertford. 2. A continuation of Dr. Hooker's memoir on the Balanophoreæ. Polymorphism and extreme simplicity in every organ were stated to be the prominent features of this order, when surveyed in a structural point of view; and, it was remarked, were value to be attached to the fact of every organ appearing in a most degraded state in one or more of the species, Balanophoreæ would rank low in the system of phænogamic plants. Disregarding imperfection, however, all the organs are present which are necessary to warrant their being placed among phænogams, with the exception of terrestrial roots. The arguments used to exclude these plants from the Phanerogamia were summed up by the author, as coming within the following category: (*a*) erroneous views of the nature of the seeds (Endlicher, Martius, Blume, and others); (*b*) of their origin being in a diseased state of the plants they grow on (Junghuhn and Trattinick); (*c*) a supposed similarity to fungi, and an erroneous idea that their appearance is meteoric and their growth rapid (Endlicher); (*d*) the resemblance between the articulated filaments on the capitula of the Helosideæ, and the paraphyses of Musci, and between the pistilla of Balanophora, and the pistillidia of Musci (Griffith and Lindley); (*e*) the resemblance of the cellular and vascular tissues in some of their characters to those of Ferns (Unger and Goeppert); (*f*) a very peculiar view of the nature and relations of the parts of the female flower (Weddell, who hence refers Balanophoreæ with Rafflesiaceæ to Gymnosperms). These views, Dr. Hooker observes, their several authors would never have entertained had they been sufficiently furnished with specimens. After discussing further some of the opinions entertained by botanists as to their affinities, Dr. Hooker goes on to state his own view, which is, briefly, that the vascular bundles in the rhizomes of Helosis and Langsdorffia are sufficient evidence of their being dicotyledonous, these being altogether exogenous, and not differing from the stems of Menispermaceæ and other anomalous but undoubted dicotyledons. "The Balanophoreæ," he continues, "have an adherent perianth in all the genera where this organ is developed, and an epigynous stamen in Cynomorium, the only species in which hermaphrodite flowers occur. These characters indicate a position amongst the epigynous Calycifloræ, a group which, though far from being well limited as a natural class, is in our present state of knowledge one of considerable value, as comprehending many nearly allied natural families. Amongst them, the most direct relation of the Balanophoreæ is certainly with Halorageæ and Gunnera, with both of which it presents many important characters in common, and between which I would place it in the linear series." This view Dr. Hooker proceeds to illustrate by a detailed comparison of individual organs, and to meet such objections as may probably be urged against it. In the classification of the genera and species, Dr. Hooker prefers Griffith's primary divisions, monostyles and distyles, which are perfectly natural. The greater number of these plants belong to the tropical and subtropical mountains of Asia and South America; in both hemispheres certain species ascend to 10,000 feet. A considerable number are extra-tropical, as Cynomorium, which attains lat. 41° N. in Europe; the two Mystropetala and Sarcophyte, which inhabit South Africa; an Helosis from the Plata district, and the North Indian species of Balanophora and Rhopalocnemis. The individual species have often exceedingly wide ranges, though some are extremely local. The most conspicuous examples of extensive distribution are Cynomorium coccineum, which ranges from the Canary Isles to the mouths of the Nile, namely, through 3000 miles of longitude; Rhopalocnemis, which is found in lat. 27° N. in East Nepal and Sikkim, in the Khasiya mountains of East Bengal, and in Java under the line, places no less than 3000 miles apart; Balanophora fungosa, which is found both in East Australia and in Tanna, places separated by 1500 miles of ocean; and in the New World, Langsdorffia hypogæa has been found in the province of Oaxaca, in Mexico, in the mountains of New Grenada, and at Rio de Janeiro, having thus a range of 4000 miles in a straight line. The widely distributed species, it is remarked, do not vary much according to the distance they spread.

Notices of Books.

The Art of Travel, by Francis Galton, (Murray, post 8vo, 12s,) will be found as indispensable to the traveller in wild countries as "the Handbooks" are to mere tourists. It is evident that the author is a man of experience; he knows what the traveller wants and what he has to encounter; upon both points he gives advice, which is as judicious as it is abundant. Water, fire, bivouac, clothes, food, discipline, defence, hiding places, boats, ponds, &c.; roads, carriage, carpentry, skins, writing materials, cattle, horse furniture, fire-arms, trapping, fishing, medicines, presents for barter, expenses, philosophical instruments, form so many distinct subjects, each of which is carefully worked out and well illustrated with woodcuts. Such a quartermaster-general or commissary-general would have secured us against the disgraceful mismanagement in the Crimea; it is of men like Mr. Galton that such officers should alone be made, carpet knights and gentlemen in uniforms with red tape facings are only fit for the atmosphere of St. James's. The author's advice as concerns water enables us to make an extract illustrative of the manner in which his very useful little volume is written:—

"*To purify water that is muddy, putrid, or salt.*—With muddy water, the remedy is to filter, and to use alum, if you have it. With putrid, to boil, to mix with charcoal, or expose to the sun and air; or, what is best, to use all three methods at the same time. With salt water, nothing avails but distillation.

"*Muddy Water.*—When at the watering-place there is nothing but liquid mud, take a good handful of Grass, and tie it roughly together in the form of a cone, 6 or 8 inches long; then dipping the broad end into the puddle, and turning it up, a streamlet of partly-filtered water will trickle down through the small end. This excellent plan is used by the northern bushmen—at their wells quantities of these bundles are found lying about (Andersson). Otherwise, drink through your handkerchief—either put it over the mouth of your mug, or else throw it on the liquid mess as it lies in the puddle, and suck through. For a copious supply, the most perfect plan, if you have means, is to bore a cask full of auger-holes, and put another small one, that has had the bottom knocked out, inside it, then fill up the space between the two with Grass, Moss, &c. Now sinking the whole in the midst of the mud, the water will filter through the auger-holes and Moss, and rise up clear in the inner cask, whence it can be ladled. With a single cask, the lower parts of the sides may be bored, and alternate layers of sand and Grass thrown in, till they reach up above the holes; through these layers the water will strain. Or a canvass-bag that is kept open with hoops, made on the spot, may be moored in the muddy pool, by having a heavy stone put inside it, and will act on the same principle, but less efficiently than the casks. Turbid water is also, in some way as yet unexplained, made clear by putting a piece of alum into it. Three thimblesfull of finely-pounded alum will clarify a bucketful of turbid water. It is generally used in India. I cannot say if alum will clear every kind of turbid water, but it is certainly met with in very general use.

Putrid Water should always be, at least, boiled before drinking it, as low fevers and dysenteries too often are the consequences of its being used; bitter herbs, if steeped in it, or even rubbed well about the cup, are said to render it less unwholesome."

Tintern Abbey: a Poem (by F. B. Ribbans, F.A.S. 4to, Hall and Virtue), contains three extremely good representations of this fine old ruin, introduced by some agreeably written stanzas, and a few antiquarian notes. The volume is one for the drawing-room.

Every Man his own Printer, or Lithography Made Easy (4to, Waterlow, 5s), is an explanation of the manner of preparing lithography for the printer, and of using the "patent autographic press," now a good deal employed in large offices for the rapid multiplication of copies of letters, &c. Private persons will, we suspect, prefer to send their drawings to a printer for working off, rather than trouble themselves with a press of their own.

Garden Memoranda.

HORTICULTURAL SOCIETY'S GARDEN, TURNHAM GREEN.—The stoves here are now becoming gay with Begonias which are well known to be most useful plants for winter decoration; but in addition to these some other plants at present in flower require especial notice. One of the most ornamental of these is Thyrsacanthus rutilans, a stove plant as yet scarcely known, but which should be in every collection, as it is really one of the handsomest things that has been introduced for years. It produces great quantities of brilliant crimson tubular flowers attached near the ends of long branched drooping flower stems, which when tied out a little, so as to fully expose the blossoms to view, render the plant very effective. The flowers also keep a long time in perfection, a desirable property at all times, and especially at this season of the year. Another plant, which cannot be too highly spoken of, is the Flax called Linum trigynum, a hardy greenhouse plant, whose numerous bright yellow blossoms, each as large as a half-crown piece, are extremely showy, and they continue to be developed in succession for several weeks. Sciadocalyx Warscewiczi, a Gesnerad resembling Achimenes picta, is a tolerably handsome stove plant at this season, as is also a Clerodendron, with pale yellow flowers, called C. splendens Hugeli.

Among Orchids in bloom the most important was Dendrobium speciosum, a noble plant, which, however, is scarcely yet in perfection. It has upwards of 12 flower spikes on it, many of them quite 15 inches in length, and when fully out must produce a glorious effect. This plant has been kept comparatively cool, and we are thus led to believe that the reason it so seldom flowers is because it is kept all the year round in too warm a temperature.

In the great Conservatory several kinds of Habrothamnus were in bloom, among which one called scaber promises to be an improvement on elegans, to which it bears considerable resemblance. A mass of H. fascicularis was also in blossom, and when large and well flowered as this was few winter flowering plants are handsomer. The Camellias in this house are coming finely into flower; elegans in particular is literally loaded with its large showy blossoms, notwithstanding that its flower-buds had been previously very much thinned. The sweet-smelling Luculia gratissima is also still in fine condition, although it was in full flower when we saw it a month ago, and even long before then. On the side shelves plants of Selago distans were in flower, together with Heaths, early Tulips, Hyacinths, and other spring bulbs, Primroses, and Acacias, all of which serve to produce a large amount of gaiety, even thus early in the year.

The Orchard-house has been re-arranged and put in order; it is well stocked with fruit trees of new or little known kinds in pots; even Raspberries, Gooseberries, and Currants (red, white, and black), have been potted and put in it for trial. Round the sides of the beds are Strawberries in pots, a situation well adapted for them in winter, and from which they may either be removed to warmer quarters if it be desired to have them early, or if allowed to remain where they are they will come in a little before those in the open air.

Protections for pits, &c., have been in great requisition during this winter, and in addition to frigi domo, several contrivances made of straw have been tried. The best of the latter has been made of long Wheat straw laid crosswise on three pieces of tar twine (at equal distances apart), on which the straw is worked with common twine, in the manner recommended by Mr. Brewer, of Pine Apple Place. These protections when completed are about 10 feet in length, and nearly 4 feet in width; they are light, and have the advantage of being capable of being speedily rolled up and set on end in any corner out of the way. Another description of covering is straw fastened on a skeleton sash; this answers very well, but when they are pulled off they cannot conveniently be put out of the way. The third kind of new covering tried has been straw placed be-

tween wire screens made of zinc, but these are said to have the faults of being too heavy and apt to break the glass.

Out of doors the thaw had only two days set in, and although the snow had nearly disappeared, little if anything certain can as yet be said of the effects on vegetation of the late severe weather. It may be mentioned, however, that Berberis nepalensis, tinctoria and other species appear to be much injured, as are also several of the Mexican Pinus, except Lindleyana, which has not been hurt in the least. Ribes speciosum is apparently injured considerably, and so are plants of Daphne pontica and laureola. A small plant of Assam Tea has only had a leaf or two browned. Rhododendrons appear to be safe, and Laurustinus do not seem to be hurt, nor even the young shoots of the common Bay. The Chusan Palm has unfortunately suffered in the outer leaves, but the centre looks green and healthy. The Pampas Grass is quite blanched, but whether or not it is killed remains to be seen. In the kitchen garden young Cabbages and Broccoli are greatly blanched, but we think not killed, although it is reported they are so in some of the market gardens in the neighbourhood. In a short time it will be better known what has been killed and what has not. When the thermometer has been down to zero, as it has been here, and the frost a foot deep in the ground, the effects on vegetation must be expected to be great, and these it will be our business to report next month.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Such of the twiners as were closely pruned in autumn will, under the influence of sunny days, soon be starting into free growth, and it is of the utmost importance to get them as thoroughly cleared of insects as can be done while they are in a dormant state. The flowering plants should be removed to one end of the house, so as to allow of giving the twiners a good washing with the engine, which will have the desired effect on most things, and will also be useful in cleaning the glass, &c. But such things as Acacias and Jasmines, if affected with white scale, to which they are very liable, will be but little benefited by this operation, for these are more difficult to eradicate when allowed to get fairly established than red spider, and we know no other way of destroying these pests, than by taking them in time, and painting the affected parts with a mixture similar to that recommended a few weeks ago for fruit trees. This, like all other insects, is particularly troublesome only when the plants liable to its attacks are grown under circumstances unfavourable to its habits, and in this case the affected plants should be taken up and replaced with others of a more suitable character for the position, for it is nearly impossible to keep plants clean, unless they can be kept in vigorous health. Take every opportunity of admitting fresh air; but after the confinement to which the plants have necessarily been subjected, cold currents will be dangerous and should be avoided. Be satisfied with a rather low temperature at present, and use only sufficient fire-heat to secure this and prevent damp in the atmosphere.

Stove.—Plants of Dipladenias, Echites, and other twiners in active growth will require frequent attention in order to properly direct their growth and prevent the shoots getting entangled. Get such things into the pots in which they are to bloom as soon as this can be done with due regard to the state of the roots, so as to allow of the shoots being properly trained to the trellises before there is risk of their being broken in the operation. Look sharply after insects of all kinds, particularly mealy bug, which will be emerging from its winter quarters, and will soon be sufficiently numerous to afford any amount of work unless every means is used to eradicate it at present.

FORCING DEPARTMENT.

Pineries.—The large use of fire-heat which has been necessary for a considerable time, will, except where great care has been used to counteract its effects, have been injurious to plants swelling fruit. Now that the weather is such that the requisite temperature can be maintained by a very moderate use of the fires every care should be exercised to keep the atmosphere saturated with moisture until the fruit begins to change colour, giving manure water to the soil as often as it may be wanted, letting the temperature range between 80° and 90° with the assistance of sun-heat; also see that the bottom-heat does not fall below 85°, nor rise above 90°. Young plants growing in the open bed that have been some time planted will be benefited by having the soil loosened up as deeply as can be done without injuring the roots, giving it a liberal soaking of tepid water if it is found to be too dry. The water should be applied by means of a rose-pot, and not so fast as to flood the surface, for if this is done the soil will be rendered almost as close as before forking up; indeed, careless watering is the great cause of the surface of the soil becoming close and hard, and should be carefully avoided. Endeavour to afford these a nice regular bottom heat, with a thoroughly moist atmosphere, and keep them growing as freely as may be consistent with keeping them dwarf and stocky. Have a constant eye to maintaining a succession of fruit, or securing a supply at the season when it may be most wanted, and let the treatment of the plants be regulated in time by your circumstances; for this is a matter which demands considerable forethought, and which can be successfully managed only by careful observation and attention.

Vineries.—The unusual amount of fire-heat which the long-continued severe weather has rendered necessary has been anything but favourable to Vines fairly started, and this, combined with the absence of sunshine and the difficulty of admitting fresh air, has had a tendency to induce weak long-jointed wood and thin foliage, and where this has occurred the greatest care should be exercised to get the wood and foliage strengthened. Take advantage of every favourable opportunity to admit fresh air as freely as can be done with safety, and be satisfied with as low a temperature from fire heat as may be considered safe under the state of the Vines, but shut up early on sunny days, allowing the glass to rise considerably. This will to some extent economise fuel, and will be much more congenial to the Vines than so much fire-heat. Except where the Vines are in flower keep the atmosphere moist, but the foliage should always be allowed to become dry in course of the day. Look carefully for red spider in the early houses, for the amount of fire-heat which has lately been necessary will have been very favourable to the increase of this pest, and it will probably be making its appearance upon Vines that have been at all liable to it formerly. Attend carefully to the state of the borders, and where fermenting materials are used do not allow the heat to decline because the frost is gone, but aim at securing a steady warmth of about 70°, at a foot below the surface.

Peaches.—Where the trees are in bloom admit air freely whenever the weather is mild, and keep the atmosphere rather dry, maintaining a steady night temperature of about 50°. Trees on which the fruit is fairly set should be afforded a moist temperature, syringing them liberally in the afternoon to prevent red spider, and keeping the border in a healthy state as to moisture, &c., to secure a vigorous root action.

Cucumbers.—These may now be kept at from 65° to 70° by night, and 70° to 80° by day, with a steady bottom-heat of about 85°, which, combined with a thoroughly moist atmosphere, will induce free growth. Keep the shoots thin near the glass, and attend to stopping, &c., as may be necessary. Attend carefully to the early Melon plants, and regulate the temperature according to the state of the plants and the amount of sunshine, taking care not to get the Vines weak and long-jointed through a high close temperature, for a fair crop of fruit need hardly be expected unless the Vines are kept strong and short-jointed. Do not omit putting in seeds of the favourite summer kinds.

FLOWER GARDEN AND SHRUBBERIES.

In the present state of the ground but little can be profitably done in these departments; it may be reasonably hoped, however, that the ground will be in a fit state for work of all kinds before this appears; meantime walks and lawns will require frequent rollings, to properly consolidate them after the frost, and this should be attended to at once, for if dry weather should set in the roller will be less effective than now, and the walks and lawns will not be easily put into proper spring order. Where any alterations are in hand, these will of course demand attention as soon as ever the frost is out of the ground, and the removal of shrubs or planting, where such has been unfortunately delayed thus far, should be finished with the least possible delay; and no unnecessary time should be lost in getting alterations involving the relaying or putting down of fresh turf completed, for it is a great saving of after labour and attention to get this kind of work finished before the drying March winds set in. If not previously done, get Pillar Roses pruned and tied; and where wood stakes are used examine these carefully, and renew such as are not likely to last the season, for they are troublesome to replace after the plants begin to ramble about. It is an excellent practice on most soils to give these a liberal dressing of manure water in a very strong state in the winter; or, where it can be obtained, night soil mixed with water, so as to reduce it to the consistence of thick paint. The surface soil should be removed for about two feet from the stem of the plant, placing it so as to form a basin, and the under soil stirred as deeply as can be done without injuring the roots, giving from four to eight gallons to each, according to the strength of the plant, and replacing the soil. This will be much more efficient in inducing a vigorous growth, and in the case of the autumn blooming kinds securing a fine display of late flowers, than all the manure that could be applied. Push forward the work of propagation with the least possible delay, and endeavour to keep the young stock strong and stocky.

HARDY FRUIT AND KITCHEN GARDEN.

There will be no want of work whenever the state of the ground will admit of its being done. A small sowing of Radishes, to succeed those in frames, should be made on a warm dry border; also Early Horn Carrots, Turnips, and a moderate breadth of Parsley should be got in where there is any danger of a scarcity of this much used plant. Where the Lettuce and Cauliflower plants have been injured by the late frost, there will of course be a supply coming on under glass. These and the early Celery are best raised on a slight hot-bed, where they can be kept close to the glass, and afforded plenty of air; but where this convenience cannot be commanded, they may be raised in pans or boxes in the forcing-houses, taking every possible care to keep them stocky, and carefully inuring them to exposure to the open air before planting out. Onions and Parsnips may also be sown at once, where the ground is clear of frost, and in a fit state for working, but until this is the case all seeds will be better in their papers. Peas that were sown before the frost should be carefully examined, in order to ascertain what amount of injury they have sustained, and fresh seed put in as may be necessary to make good the lines. See to providing for a succession of this much esteemed vegetable, and get those raised under glass prepared for planting out by full exposure on mild days. Of course every advantage will be taken of favourable weather for nailing, &c., in order to get this work done so as to have the hands at liberty for other work.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the week ending March 1, 1855, as observed at the Horticultural Gardens.

Satur. 10	50.8	32.4	41.6	12	0.69	3	4	1	3	3	7	3	[illegible]

The highest temperature during the above period occurred on the 9th, 1826—therm. 68 deg.; and the lowest on the 10th, 1847—therm. 7 deg.

Notices to Correspondents.

Bell Glasses: *Milo.* They may be had of any large glass dealer.‡

Books: *F H G.* Endlicher's "Synopsis Coniferarum" is the best modern work on Conifers, but it is quite technical and abounds in errors or omissions. The most accurate list is that published in the Journal of the Horticultural Society, Vol. V., p. 148. A good work is much wanted; but there is no chance of its being undertaken until a sufficient fund is subscribed to secure author and publisher against loss.—*A. N.* There is a Flora Melitensis; but it can only be procured in Malta, even if there. There is no other.

Crickets: *Manchester.* The best trap for crickets is *thick treacle* in soup plates, preserving jars, or wide-mouthed bottles, placing in each just sufficient to cover the bottom. They should be plunged to the rim in the ordinary plunging material of the house, in order that the crickets may experience no difficulty in entering, though if soup plates are used they will jump in freely. When the surface of the treacle is covered they must be emptied into hot water, and the traps baited again.‡

Dioscorea japonica: Buyers of this are recommended to take care what is sold them before they pay. We have seen lately what are called plants, for which the mere postage would be too great a price. They ought to be tubers, and not smaller than a sparrow's egg.

Guano: *P Y.* The purity of guano can only be ascertained with certainty by means of chemical analysis. If, however, you fill with it the bowl of a clay pipe and put it into a fierce fire, if there is any red colour communicated to the clay you may be certain that the sample is adulterated. Cover such a bank with Ivy, the larger Tutsan, Privet, Holly-leaved Berberries, Savin bushes, and plant among them any coarse herbaceous plants.

Laburnums: *An Old Sub.* We presume you have before you what is called *Cytisus Adami*, a curious production, sometimes putting out branches of the common Laburnum, sometimes of *C. purpureus*, sometimes of a plant intermediate between the two. The exact cause of the appearances has never been satisfactorily explained; but they are probably owing to a plant of the common Laburnum having been budded with the purple Cytisus, which having failed to develope its own bud, tainted the stock on which it was worked.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Ditton.* A very bad specimen of some Crassula, probably Cr. lactea.—*Rusticus.* We do not know.

Orange Boxes: *W H.* Orange trees or other plants grown in boxes coated over inside with Stockholm tar, are not injured thereby.‡

Portulacas: *Buxton.* They require an open soil, such as very sandy loam, moderately enriched with leaf mould, or other light manure. They do best in pans about four inches deep, well drained, or if pots are used, they should be filled half full of potsherds. The damping off has been caused most probably by the plants growing too thickly together, and the soil being too rich ‡

Roses: *A Lady.* The following selection of three dozen Hybrid Perpetuals may possibly suit your purpose. Blush:—Jeanne d'Arc, Madame Aimée, Marquis of Boccella, Queen Victoria, Mrs. Rivers, Madame de Manoel, Mère de St. Louis, Lady Steward, and Blanche de Beaulieu. Pink and light Rose:—Caroline de Sansal, Auguste Mie, Duchess of Sutherland, Madame Aline Gibbon, Louis Peyronny, Madame Lamoricière, Reine des Fleurs, and Duchesse d'Orleans. Rose:—Augustine Mouchelet, Baron Prevost, William Jesse, Dr. Marx, Madame Laffay, Comtesse Duchatel, Louis Odier, James Veitch, and Jacques Lafitte. Crimson:—Géant des Batailles, Beranger, Robin Hood, Comte d'Egmont, Louis Buonaparte, Triomphe de Paris, President Pierce, Apollo, Baronne Hallez, and Melanie Cornu.‡

Stephanotis floribunda: *W N.* The fruit of this, when ripe, is greenish Apricot coloured and poisonous.‡

Misc.: *Sub.* We doubt whether Lapageria rosea is a sufficiently free-blooming plant to be really ornamental under the conditions you mention. It is, however, well spoken of by some. See our vol. for last year, p. 725. It likes a light situation and peaty soil; a place against a wire-work pillar exposed to the sun would suit it better than the back wall. Passiflora Buonapartia will not flourish in the temperature of 40° by night. Pleroma elegans will do so; Dipteracanthus spectabilis will not. ‡—*O B.* 2*s.* 6*d.* first four lines, 6*d.* a line after.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, sec.

Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

THE MANCHESTER SEWAGE GUANO COMPANY respectfully inform Agriculturists that they have made arrangements which will enable them to meet the increasing demand for their Manures. The MANCHESTER SEWAGE GUANO is a compost of Blood, Bones, Urine, Nightsoil, and other Animal Matters, and highly fertilising Chemical Ingredients, which are in a concentrated state incorporated with Animal and Vegetable Charcoal, ground to a fine powder, *the whole forming a dry portable Manure.* It is free from all kinds of Seeds, Weeds, &c., and enriches the land to a considerable degree for several years after it is used. Price 5*l.* 5*s.* per ton. Net cash on delivery. Testimonials forwarded on application. Carriage free to any Railway or Canal Wharf in Manchester.—JOHN THOMPSON, Secretary, 3, Watling Street, Shudehill, Manchester.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

RENDLE'S AGRICULTURAL PRICE CURRENT AND FARM DIRECTORY FOR 1855, *with Newspaper Stamp to go free by post, is now published, and can be had in exchange for six penny stamps.*

The proprietors of this well-known and widely circulated publication have much pleasure in announcing another edition for the present year. They have spared no expense nor trouble in making it a most useful and serviceable guide to all who take an interest in the cultivation of the soil. It contains a valuable Descriptive List of all the best AGRICULTURAL SEEDS, with prices affixed to every article, with cultural remarks and general information as to the best varieties for various crops.

The List of TURNIP SEEDS is very comprehensive, and is embellished with an ENGRAVING of RENDLE'S IMPROVED SWEDE TURNIP—a variety in great favour in the West of England.

The descriptive Lists and Tables of the best selected GRASSES are very complete, and will be found eminently useful to all who intend laying down land for Permanent Pasture, Ornamental Parks, Pleasure Grounds, &c.

There is a very useful ALMANACK, which has been compiled with much care.

In the MANURE DEPARTMENT there is a general Price Current of all the leading Manures, including Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, &c.

The ORIGIN AND HISTORY OF PERUVIAN GUANO will be found amongst its contents, as well as some excellent advice for detecting the spurious from the genuine article. The proprietors have been favoured with some good sound advice to Farmers on this point by J. C. NESBIT, Esq., the celebrated Agricultural Chemist. They have also reprinted PROFESSOR WAY'S LECTURE on the same subject, from the *Gardeners' Chronicle*, read to the Members of the Royal Agricultural Society.

Descriptive articles relating to Lawes' Patent Superphosphate, Nitrate of Soda, the new Mexican Guano, and other manures will also be found very useful and interesting.

The "SUPERPHOSPHATE CONTROVERSY" in the Plymouth Papers is also given at length. The whole of the letters are reprinted from the *Plymouth Herald.* In this Controversy the "*Gypsum mixers*" are fully exposed by Mr. J. PRIDEAUX, the eminent Agricultural Chemist.

A valuable Paper has also been written expressly for this Edition by Mr. R. ERRINGTON on the "*Cultivation of the Potato,*" as well as an article on "*Liquid Manure*" by the same gentleman.

The Proprietors have also much pleasure in stating that they have been favoured with two Original Articles, by J. B. LAWES, Esq., Rothamsted, the celebrated Agricultural Chemist, on "*The Artificial Manures most suitable for the Growth of Barley*" and "*The Cultivation of one Grain Crop after another on heavy land.*"

There will be a good Engraving of the CEDRUS DEODARA, one of the hardiest and best varieties of Cedars ever introduced, and prices of various Forest Trees, Shrubs, and Fruit Trees.

Engravings and descriptions of a great many Agricultural Implements are also added in the present Edition, and amongst them will be found M'CORMICK'S AMERICAN REAPER, GARDNER'S TURNIP CUTTER, SAMUELSON'S REGISTERED LAWN MOWER, PATENT LIQUID MANURE DISTRIBUTOR, WARNER'S GARDEN ENGINES, PUMPS, SYRINGES, &c.; FOWLER AND FRY'S CHAFF CUTTING MACHINE AND ONE ROW TURNIP DRILL, ANTHONY'S PATENT AMERICAN CHURN, AND PARKES' STEEL DIGGING FORKS.

Descriptions are also given of the New CHINESE POTATO (Dioscorea Batatas) and the FLUKE KIDNEY POTATO, a sort highly recommended in the Midland Counties.

At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It contains 28 *folio pages, "Chronicle" size.*

Copies can be procured, price 6*d.* each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the

LONDON PUBLISHING OFFICE, 294, STRAND;
Or from the Proprietors, WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh,	light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch „	strong „ ...	9 „	6½ „
2-inch „	extra strong „ ...	12 „	9 „
1⅝-inch „	light „ ...	8 „	6 „
1⅝-inch „	strong „ ...	10 „	8 „
1⅝-inch „	extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.

Canonmills Bridge, Edinburgh.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s.*

M. WEDLAKE, 118, Fenchurch Street, London.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which RICHMOND AND CHANDLER have attained in the manufacture of Agricultural Implements; and the recent improvements made upon their various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated) are of the highest value in the economical preparation of food for cattle.—Address RICHMOND & CHANDLER, Salford, Manchester and South John Street, Liverpool. Catalogues gratis.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

NEW FEEDING SYSTEM.—NO OTHER MACHINE BUT KEALY'S PATENT PRIZE ROOT PULPER prepares the Turnip or Root for Lambs, Mash Feeding, or Fermented Food, which method is attended with an immense saving in time and money. Its exposition at the Cattle Show has created an unprecedented demand.

KEALY & Co., 369, Oxford Street, London.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.

Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

The Agricultural Gazette.

SATURDAY, MARCH 3, 1855.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

MONDAY,	March 5	—Central Farmers' Club.
TUESDAY,	— 6	—Agricultural Imp. Soc. of Ireland.
WEDNESDAY,	— 7	—Agricultural Society of England.
WEDNESDAY,	— 14	—Agricultural Society of England.

IN reference to the article on TURNIP-GRATING in another column, we may just mention that we saw at Mr. TELFER'S, last week, a Turnip-grater which made a very near approach to pulp—a thing we had never seen before. Any previous so-called Turnip-grater has turned out the Turnip merely in thinner, narrower slices than is done by the common Banbury machine. And this is done by the acting cylinder

presenting to the direction in which it revolves a number of raised edges over holes, which the ribbon-like pieces, cut or grated off the root by these edges, pass through. Mr. TELFER's grater is a solid cylinder of wood covered with sheet iron, which has been pierced all over from the inside outwards, with a solid pyramidal-pointed punch. At each of these points the sheet is torn open, presenting three torn teeth, and over the whole surface so punctured these teeth point promiscuously in every direction. The cylinder revolves several hundred times in a minute, and 18 cwt. of roots are torn down by it in the hour. This grated Mangold is not allowed to ferment as in the plan described in another column: 3 cwt. of it are steamed and mingled with 25 lbs. of Bean-meal and 84 lbs. of Linseed and 70 or 80 lbs. of the Oat-husk from the Oatmeal mill—each steamed separately, and the whole then mingled together, and these quantities make one of the feeds which are given daily to 48 cattle in the byres. It is in the adaptability which they thus acquire for intimate commixture with other food that the advantage of grating or pulping roots is chiefly found.

THE present is the season during which purchases of artificial manures are generally made, whether for top-dressing the young Wheat—and its present appearance after the frost will be a temptation to the more general use of top-dressings than has hitherto prevailed—or for use as auxiliaries to the ordinary dressings of farm dung for Turnip and other green crops. Mr. PUSEY's confident recommendation of nitrate of soda will occur to many a purchaser about to enter the guano market; and salts of ammonia, whether obtained by direct distillation from coal, as in the sulphates, &c., prepared from gas water, or made in a roundabout way out of various preparations of animal offal, blood, &c., which are now coming into more general use—anything, in short, as well as nitrates and ammoniacal salts, which shall in any degree lessen the demand upon our limited supplies of guano, is of great agricultural and national value. We hope next week, or very soon, to give what information we can obtain of the London Manure Company's supplies and methods of supply—of the Nitrophosphate Manure Company's proceedings also, where blood comes into direct use—of the Cyanic Manure Company too, all of whom advertise in our columns: but before giving in this way the actual quantities and qualities of the material on which the annual fertility of the land is to depend so much, it may be well just to direct attention to the principle on which all these fertilisers act. And no way of doing this can be more appropriate than that afforded by a short review of an interesting lecture lately delivered to the members of the West Cambridgeshire Agricultural Club, "On the connection of chemistry with agriculture—its uses and abuses,*" by the Hon. and Rev. L. VERNON HARCOURT, to whom the readers of the *Agricultural Gazette* have in past years been indebted for some of the most valuable papers which have appeared in its columns.

The first few pages of this pamphlet are occupied by a parallel between the arts of agriculture and medicine—showing how, in both, chemistry has reformed practice, and how experiment, under its guidance no longer groping in the dark, is likely to improve experience. The larger and more important portion of this publication is, however, devoted to a critique upon Mr. PUSEY's late paper on "the Nitrate of Soda as a Manure," and it is to this that our remarks must at present be confined. We believe that in this matter Mr. HARCOURT is right and Mr. PUSEY is wrong; and as the subject on which they differ is of real and, at the present time, of seasonable importance, we shall reproduce the statement of the former, avoiding however the character which he has unnecessarily given to it of a personal attack upon the then President of the Royal Agricultural Society of England.

Mr. PUSEY, it will be remembered, attributed the whole effect of the nitrate of soda to the nitrogen which it contains.

Mr. HARCOURT shows that the experiments on which he depends for this conclusion do not necessarily lead to it. He also says that the idea of the nitrates being the only fertilisers is opposed to the experience of every other observer. For himself he says:—"For eight years together I tried nitrate of potash on Wheat against sulphate of soda, and invariably found the latter yield a better crop than the nitrate, though during all that time not a particle of nitrogen was added artificially to the soil." And Professor JOHNSTON says in his "Experimental Agriculture" that though the nitrates "usually, but not invariably, increase the quantity of corn crops, yet they impair the quality of the grain, or market value per bushel: this is said to be especially the case in regard to Wheat; and Mr. HOPE found 90 lbs. of nitrate with 180 of guano give a heavier crop of Clover and Grass at less expense than 180 of nitrate alone."

Now Mr. HARCOURT says truly that nobody will contest any moderate praise of nitrogen in its forms of the various nitrates and of the several ammoniacal salts. "Its value is well known, especially since the publication of Mr. LAWES's experiments. It is a constant subject of advice to farmers to prevent the escape of ammonia from their dunghills; and nitrate of soda and sulphate of ammonia have long been used as valuable manures." But to speak of nitrogen as "the main strength of vegetation by a law of nature" is not only mistaken in itself—it is calculated to mislead with regard to the whole scope and philosophy of manuring.

We prefer guano to nitrate of soda as a manure, because the former supplies nearly all the building material needed by the plant; while the latter at most supplies but three, and in effect but two, of these essential substances. Doubtless the most economical manuring is that which supplements deficiencies in the natural supplies of food for plants; but seeing that generally we do not know wherein a soil may be deficient, it is well to employ manures which are more compound in their nature than a single mineral salt can be. Hence it is that farm-yard manure is the best of all as to its character, though no doubt there are many forms of fertiliser more intense and energetic in their action.

If a soil does contain abundant store of mineral and other food, then some nitrogenous manure, such as nitrate of soda, will no doubt excite most vigorous growth and produce, and experiments with nitrate of soda performed under such circumstances will corroborate all that Mr. PUSEY has said in its favour. But such soils are the exception, and we believe that top-dressings of the young Wheat plant will be safer and more profitable if they are more mixed and compound in their character. We recommend, therefore, in preference to 1½ cwt. of nitrate of soda per acre for the Wheat plant an equal value of genuine Peruvian guano.

* Published by JOHN WARREN, Royston.

LAND IMPROVEMENT COMPANIES.

I have to beg you will favour me with space for a few words of explanation on the points referred to by Mr. Napier in last week's *Agricultural Gazette*.

Mr. Napier alleges that there are two inaccuracies in the passages you did me the honour to quote from my recently published paper on "Land Drainage and Drainage Systems," which might injuriously affect the Lands' Improvement Company; and to a certain extent the allegation is true, but not wholly so. I admit the error respecting the clearing of lands—it was unintentional, and shall be rectified in the second edition of my pamphlet, which is now preparing. But with respect to the maximum amount of annual instalment chargeable by that company, the question of what rate of interest shall represent the future value of money is so entirely problematical that the Lands' Improvement Company are in fact rather benefited than injured by widening the latitude of possibilities. I am informed by persons conversant with money matters that, if the present war continues, there is great probability that the rate of instalment of 7*l.* 11*s.*, which is the rate complained of, will not only be reached but will be exceeded; and as some proof of this the Lands' Improvement Company have, I believe, already increased their annual rate of instalment to 6*l.* 17*s.* 6*d.*, which is within 3*s.* 6*d.* of Mr. Napier's maximum. I tender this explanation merely to justify your observation that the account I gave in my paper of the different companies was "historical," and not ex-parte.

But the concluding observations by which Mr. Napier supports the practice of the Lands' Improvement Company of advancing money to landowners who have executed works of improvement by "their own agents," require a few remarks to show in what way the General Land Drainage Company does the same thing. The fact is this: the General Land Drainage Company has two branches of business, the execution of works (which the Lands' Improvement Company does not undertake) and the advance of money on works approved and executed, which is simply and singly what the Lands' Improvement Company does undertake. That the two branches of business do not militate against each other is proved by the fact that the General Land Drainage Company has been selected by many leading landowners, to execute works of improvement on commission, while their system of advancing money on approved works has been gradually gaining a position to which it would appear there will be no limit when it is properly understood and appreciated. If we compare the mode of working this money advancing system adopted by the two companies, we shall find a somewhat different but equally simple means of effecting the object. The Lands' Improvement Company requires simply that the "Assistant Inclosure Commissioners" or inspectors shall be satisfied, whereas the Directors of the General Land Drainage Company having greater powers to protect as well as a practical character to maintain, require to be *self* assured that the powers entrusted to them are not abused, nor the character of their company prejudiced by bad work.

I observe the compliments bestowed by Mr. Napier on the Government Inspectors, and I do not desire to lessen the influence of his good opinion, but I venture, nevertheless, to assert that there is not one of those officers who has not seen reason to regret the very imperfect manner in which much of the drainage has been done under the Public Drainage and Private Money Drainage Acts.

No one has ever thought of holding the Inspectors responsible for details committed to the superintendence of ignorant and unpractised men, and as long as ignorant and unpractised men are intrusted (as they continue to be) with such important works as drainage so long will the mode of carrying out the several Drainage Acts be liable to abuse. Now, it is just this abuse of the powers delegated to them that it becomes the duty of all companies to use their utmost vigilance to prevent. It is not assumed that everything a draining company may undertake must itself be perfect; all that is insisted upon is—that knowing the liability to defects which all works of drainage are subject to, the directors acting as trustees for capitalists, and as sureties for the "advance of agriculture" are bound to use every precaution against abuse. The amount of vigilance to effect this security practised by the Directors of the General Land Drainage Company in cases where the works are performed by the landowner's own agents, is simply, in the first instance, to satisfy themselves that the proposed works are creditably designed, and, in the next, that they will be fully carried out by competent hands. And when landowners become cognisant of the fact that whereas the Lands' Improvement Company have the power to charge estate for a term of 25 years only, the General Land Drainage Company can charge for 50 years, the necessity for vigilance will not fail to be manifest to them, particularly when the explanation is accompanied by a tangible proof of the advantages attending the extended term, in the truth that it takes 6*l.* 17*s.* 6*d.* to repay 100*l.* to the Lands' Improvement Company, while it only requires 5*l.* 2*s.* 10*d.* to satisfy the General Land Drainage Company—a very sensible difference when landowners are arranging with their tenants for the payment of interest.

And what is the cost to landowners of this vigilance on the part of the General Land Drainage Company? It will be found to depend entirely upon the capability of the "landowner's own agent" to design and carry out the improvements. I need not say there are many agents quite as competent for the work as any officer connected with the Government or with the companies. In instances where the landowner is represented by such agents, the cost of the company's vigilance will be minimum, but cases may happen in which the qualifications of the agents may be so small as to raise it to a maximum. Now the maximum cost cannot exceed two per cent. on the outlay in drainage, road making, and the erection of farm buildings. And what does this practically amount to? One penny farthing per acre per annum on drainage works charged for the term of 50 years!

However gratifying or politic it may be to compliment the Drainage Inspectors and to treat with the agents of landowners without distinction of character, I fearlessly submit that such a mode of proceeding does nothing to prevent the abuses of the present system, nor to advance the character of agricultural improvements.

It would be easy to prove that in every instance where a land agent has presented a creditable work of improvement, the General Land Drainage Company have not only given him every facility of carrying it out without any objectionable interference of its own officers, but the advantages on the score of cost which they have offered will bear a favourable comparison with any other method of effecting the only legitimate object in view—effective work at the least cost.

In estimating the actual cost and charges to the landowner when treating with the Lands Improvement Company, it must be borne in mind that with an increase of responsibility the Government Inspectors must, in justice to themselves, increase their inspections. They will have, in fact, to satisfy the three parties—the landowner, the company, and the Inclosure Commissioners. *J. Bailey Denton, 52, Parliament Street, London, Feb.* 28.

AGRICULTURAL STATISTICS.

THE total Wheat crop in Scotland last year is estimated to have yielded 606,000 quarters, or about 1-30th only of the annual consumption of Great Britain. So very small is the proportion in which Scotland contributes to the staple food of her southern neighbours that, in so far as the supply of Wheat is concerned, we should miss her less than if the ports of Denmark and the Hanse towns were closed against us. Prussia alone sent us last year twice as much Wheat as all Scotland produced; and the shutting of the Russian ports is attended with much the same effect on the bread consumers of England as if the northern half of this kingdom had for two years yielded no Wheat harvest. Such facts are, doubtless, painful at the present moment, for they press upon us the extent to which this country of manufacturing industry is dependent for its food on foreign supply; but it would be as senseless to try to ignore that as to attribute its existence to free trade. The breadth of Wheat sown in this country was probably never greater than last year, under the stimulus of high prices and the prospects of war, and yet, with

all the farmer's exertions, aided by a propitious season, Scotland has yielded us only 12 days' consumption of Wheat!

The returns of land under crop in Ireland show the increase of Wheat last year, as compared with 1853, to have been very considerable; and, if the yield has been in the same proportion, Ireland will this year give us about 1,400,000 quarters of Wheat, or nearly one month's consumption. Scotland and Ireland together thus furnish us with about six weeks' consumption of the United Kingdom. So far we have something like trustworthy data on which to rest an estimate of the last crop; and, when the returns from those English counties where the experiment has been tried come in, we shall have the means of still further verifying current estimates. England is the great Wheat-growing quarter of Great Britain, and, with the favourable weather of last year, and the increased breadth sown, will probably yield not less than 14,000,000 quarters of Wheat.

Of Barley, Scotland gives about one-seventh part of the annual consumption, and of Oats nearly one-fourth. Compared with Ireland the two countries are nearly equal in Barley, while Ireland grows more than double the quantity of Oats which are produced in Scotland. The total corn produce of Ireland in 1853 was 13,500,000 quarters, and that of Scotland in 1854 about 6,000,000 quarters, Ireland thus yielding considerably more than twice as much corn as Scotland, which may be a useful hint to the Chancellor of the Exchequer, if any future claim for exemption from taxation should be made from Ireland. The crop of Potatoes in Ireland in 1853 was upwards of 5,500,000 tons; that of Scotland in 1854 about 500,000 tons, or not quite one-tenth of that of Ireland. The total money value of the corn and Potato crop of Ireland for 1853, at average prices (50*s.* for Wheat, and corresponding rates for other produce, and 30*s.* per ton for Potatoes), was upwards of 24,000,000*l.* sterling, while that of Scotland for 1854, at the same rates, is little more than 8,000,000*l.* sterling. We know not whether the revenue raised in each country bears the same proportion to the produce of their soil, but the facts stated above form a sound basis for the consideration of questions of revenue hereafter.

We have not space, amid the more stirring matters that absorb public attention, to enter in detail into these returns; but we have been struck with the comparative produce shown by them when placed beside those of Ireland for 1853. For instance, the following figures show the average produce per acre in bushels of corn and tons of Turnips and Potatoes:—

	Wheat.	Barley.	Oats.	Turnips.	Potatoes.
Ireland.....	27	40	38	16	6¼
Scotland	28	36	36	14¾	3½

Now, this indicates an inferior style of agriculture in Scotland when contrasted with Ireland, as in every kind of produce but one the latter appears to excel. But every one who has travelled in both countries must feel that this is not the fact, but that very much the contrary is the fact. If the Scotch returns, therefore, are in any degree accurate, the Irish ones must be most erroneous, and in extending this inquiry to England we should do well to follow the Scotch mode rather than that of Ireland. It is worthy of note that the two most northerly counties of Scotland, Caithness and Sutherland, show the highest average produce of Wheat and Turnips per acre, a fact which we cannot help attributing in a great degree to the spirit of agricultural improvement early introduced into that remote district by the late Sir John Sinclair, formerly President of the Board of Agriculture.—*Times.*

[The average produce of Wheat in the northern counties being so large is owing to the very small extents to which those returns refer—extents confined exclusively to the best soils in the several counties. And as to the comparison between Irish and Scottish agriculture here instituted, we have no doubt that the explanation suggested is the true one. The Scottish estimate is, no doubt, near the truth—and the Irish *is* "most erroneous."]

DUCHESS 67 AND HER CALF.

In your interesting article on short-horns of the 10th Feb. you allude to the calf of Duchess the 67th as "one of the most vigorous young quadrupeds that ever puzzled those who condemn in-and-in breeding." If, however, you examine her pedigree, you will find that although it contains a good deal of close breeding, it can scarcely be cited as an instance of strict in-and-in breeding. In the first place, the sire of Duchess 67 was Usurer, whose blood is totally different from that of Mr. Bates' herd. It certainly was a bold innovation to introduce this strain into the Duchess family; whether it was a judicious move or not, time alone can show. At any rate, there is no affinity between the sire of the calf and the sire of its dam. The dam of Duchess 67 was by second Duke of Oxford, grandam by second Duke of Northumberland.

Fourth Duke of Oxford, the calf's sire, is by Grand Duke, his dam by second Duke of Northumberland, granddam by Short Tail. Every one who is conversant with the pedigrees of these celebrated animals will perceive a considerable closeness of affinity so far. On the other hand there is also considerable diversity of individuals, no actual identity occurring until we arrive at the gr. gr. g. sire of the calf in the female line, and her gr. g. sire in the male line, both being the second Duke of Northumberland. We find then in the maternal line Cleveland Lad as the sire of Duchess 51, and he was own brother to the sire of Grand Duke. After this the maternal line continues steadily among the members of the Duchess family, while the remainder of the ancestors in the male line belong to the Oxford family.

On the abstract question of breeding in-and-in I shall say nothing, as I believe no one defends it for its own sake. The difficulty is for those who have animals of superlative merit to continue their herd without either risking the loss of some of their most valuable qualities, or resorting to near degrees of affinity. My belief is, that no man of our day has possessed such a herd as the late Mr. Bates. That he scrupled not to combine very near relations is undoubted; but it must be remembered in the first place, that the animals he began with were of most excellent quality, and in the next, that his tribes were so numerous that he was able to produce much variety, even while apparently urging the changes within a limited circle. You have yourself pointed out on the other hand, that when he saw occasion, he would freely resort to new blood. He has been condemned for both courses; but his success, now tested by time, is the best answer to his censors. The fact is, that he possessed that intuitive genius, without which no man can hope to rise above a bungler in the difficult art of breeding. With this he united long experience, and a degree of enthusiasm which no difficulties could repress, no failures could daunt. He loved his cattle for their own sake, not for the money he might happen to make by them: above all, he never forgot the character of the animal he was dealing with. He insisted on a cow being a cow, and not a mere oblong box of fat. Hence the charm of his herd, of which every individual has a character which when once studied will never be forgotten. Hence he did not, as some breeders do, neglect the milking qualities of his favourites, for he well knew that a first-rate animal may both milk and feed.

From my own experience I find the cows of Mr. Bates' blood the best thrivers on hard keep and in an exposed situation I ever possessed. The popular notion that high-bred animals are tenderer than mongrels is a mistake, arising in great measure from the injudicious nursing they too frequently receive. I never pamper my short-horns, and, therefore, when removed from my farm it would be difficult to find a situation on which they would not thrive, or food on which they would not keep their condition. *Willoughby Wood, Holly Bank, Burton-on-Trent.*

TURNIP GRATING.

[The following is the abridgment of a letter to the *Dublin Farmers' Gazette*, giving the results of experiments on grated food; the report alluded to seems to have been an opinion adverse to the practice, by Dr. Hodges of Belfast. Our opinion is, that the real use of grating is to enable the thorough mixture of different sorts of food, and not to enable or facilitate fermentation.]

The trial which Dr. Hodges reports upon took place under his auspices near Belfast, with animals the property of members of the society, who kindly offered any selection, amongst 140 tied up, and also with pigs.

At the request of some of the members of the society to my brother (the inventor of the system, and upon his request to me), I sent my steward to Belfast for one week, to show them how to go to work, and to superintend the proceedings for that time; at the termination of the week I went myself out of curiosity, and found it, not only all, but quite beyond my expectations. Also, the professor expressed himself to me—"That it was the greatest discovery of the age." The results at the end of the first week were as follows:—

	Increase—qrs.	lbs.
2 heifers on their feeding	2	0
2 " on fermented food	3	14
3 pigs on steamed food	1	7
3 " on fermented food	2	4

In the pamphlet is brought forward a trial made by another steward of mine, and carried out with the greatest precision for 30 days, and which is borne out by subsequent experiments, and which, at a low calculation, makes about 4d. per diem, saved on each pig fed on Turnips and Barley-meal, and still returning a larger and harder quantity of meat by fermenting instead of cooking.

At the termination of the first week, and after the weighing, I ordered my steward to return home, as agreed upon; but there was so great a desire amongst the members that he should be present at the second weighing that, with extreme reluctance, I so far yielded the point as that he should return for it. As he was, therefore, at the second weighing, he must stand godfather to the results, although he did not superintend the proceedings.

A chemical friend of mine stated, that the professor over fermented, and that, according to his calculation, his pigs had swallowed several gallons of brandy. The fact is, the food at first is apt to scour the animals and when this happened I suppose the professor's staff went on with the regular dose, instead of correcting it by increasing the quantity of dry food, and diminishing the other.

English hay is notoriously superior to Irish, merely because there great care is taken that it goes through but the one fermentation, and this sweet hay is again the reason why Englishmen say that Irish horses show such wonderful improvement, when they have been one year in their country. The Frenchman says, his sheep prefer the refuse of Beetroot to young Grass—as the object of their manufacture is sugar, their Beetroot must have arrived only at the first fermentation.

Why should not the pigs have sugar in their grub, when giving them a dinner to their taste—saves half our Turnips and all our fuel. *Jervase Bushe, Glencairn Abbey, Lismore.*

Home Correspondence.

Manures. With the rotation or routine of crops is connected the judicious application of manure, of which I now venture to offer the following suggestions. Many years have not elapsed since it was received as an established fact, worthy of all acceptation, that farm or fold-yard dung formed the basis of manure; but that before it could act as a fertiliser, it must be dissolved in the soil, converted into a liquid, to be then absorbed by the sponge-like processes of the rootlets, and thence carried up, as raw sap, through the ascending vessels and cells of the growing plant. About the commencement of the present century the discovery of a new substance was announced. This was analysed by Fourcroy, Davy, and other eminent chemists of the day; it was then termed vegetable mould; but subsequently, on the authority of Thaer, it received the name of humus. By some persons, zealous supporters of the humic theory, it was fancifully denominated "the cooked food of plants." Humus was described as "a dark, unctuous, friable substance, a compound of oxygen, hydrogen, carbon, and nitrogen; the result of the slow decomposition of organic matters in the earth, and found in greatest abundance in rich garden mould, or in old neglected dunghills." Thus viewed, its components constitute the elements of all animal and vegetable substances. To the theory of humus succeeded that of humine and humic acid; and here I might refer to the fourth edition of Liebig's "Agricultural Chemistry," chapters i., ii., and iii.: but considering the principles therein advocated as purely hypothetical, I prefer to return now to the agency of farm-yard manure. It is curious to observe the different opinions that have been entertained concerning the action of this manure within the soil, although not one particle of it can be taken up by the roots of plants. Some persons contend that the dung must be dissolved, and thus presented in the form of a watery solution. Liebig believed that the humus or vegetable mould (and by parity of reason the dung when reduced to carbonaceous matter within the soil,) becomes carbonic acid by absorption of oxygen, and thus yields an atmosphere of carbonic acid gas, which being taken up by the green parts of a plant nourish the organism, and thus furnish its entire system of woody matter. The specific action of manure of any kind, organic or mineral, depends mainly upon the constitution of the land. If the staple be clayey, it must be thoroughly broken up and drained to the depth of 3 or 4 feet, by tiles or pipes laid with all the accuracy that a spirit level can effect, so as to provide a gradual fall from end to end, without one single depression. Drains so made, as "Talpa" has practically shown, constitute underground furrows, which effectually carry off every drop of superfluous rain-water, be the amount of the fall what it may. I do not attempt to inquire into the varieties of soils; it must suffice to urge the absolute necessity of deep intermixture and comminution, being convinced that if adequate labour is actually bestowed upon those fundamental operations, the required manure will be placed in a position wherein it cannot fail to produce its greatest effects. We will select farm-yard manure, by way of example, as containing every fertilising element, provided the dunghills have been formed upon the principles of the one termed "Norfolk-pie." This consists of a vast heap compressed to the utmost by carting over it, and then covering it with a thick stratum of earth, by which the ammonia developed is absorbed and permanently fixed. When a manure so prepared is duly blended with deeply pulverised land decomposition of its organic elements commences, and electricity, or electro-magnetic action is set up, particularly when the ground is under crop and roots advance in growth; thus by the play of affinities sap is prepared, and propelled into the spongelets of the roots; it then ascends through the cellular system, is laborated by the leaves, and finally certain portions of it are returned to the soil through the channels of the reducent vessels. Such is the general routine of vegetable growth, the whole being effected by a reciprocating agency between terrestrial and atmospheric electricity. *J. T., Croydon.*

Horse Food.—They have Clover and a pint of corn in the morning before they go to work; they leave the stable at 6 o'clock and return to it by 11, being five hours out of the stable at their work; when they come in they have Clover as much as they can eat, and after 12 they have their feed of corn, and leave the stable at 1 o'clock for their work, and return to it from their work at 6, being five hours from their stable. They then have as much Clover as they can eat; at 8 o'clock they have their supper, which is a mash of cut straw, Linseed, bran, or Beans mixed up in this way—2 lbs. of Linseed meal is boiled in 8 gallons of water for about 15 minutes, and 6 lbs. of straw chaff is spread on the barn floor, the liquid is spread over it and well mixed, and the chaff imbibes all the liquid; it is again spread out, and then 5 lbs. of Bean-meal and bran are sifted through a sieve on the chaff, and the whole being well mixed together is given to each horse for his supper. During the winter the horse is fed in the morning—he gets first his feed of corn, and when this is done some Carrots are put before him to eat till he leaves the stable for his work; when he comes in at 12 o'clock he then gets his feed of corn and Carrots till he is taken out to his work, and when he comes in at night he gets some more Carrots, and has the same as above for his supper. We do not make any hay, and the horse has no dry fodder but straw, which he has in his mash, as we think Carrots are not only superior to hay but much cheaper.

We can easily raise 20 tons of Carrots per acre on the land which never, before it was broken up, produced 1 ton of hay. Now if one horse daily consume 56 lbs. of Carrots instead of 26 lbs. of hay—which they did consume the first winter, as we had not any roots to give them then—an acre of Carrots will last a horse 800 days, while an acre of hay at 28 lbs. per horse per day will only last him 80 days, but the cost attending the acre of Carrots may be double of that attending the crop of hay. *M.*

Administration of a Charity.—Below are the statistics of a Rice fund which I originated last year in an agricultural parish in Herts, with a population of about 700, consisting chiefly of labourers. The same plan has been adopted this year with success, though the Rice sold weekly has not amounted quite to the same quantity as last year, which is to be accounted for from the fact that bread has not ranged quite so high this year as last, and also that there has been more employment for labour. The conditions on which the Rice is sold, which is done by the wife of one of our farmers, are these:—1, No person in the receipt of parish relief to buy any; 2, No married couple, with either one or two children, to buy any; 3, Man and wife with three children under 16 years, to buy 7 lbs. a week; 4, Man and wife with four children under 16 years, to buy 9 lbs. a week; 5, Man and wife with five children under 16 years, to buy 11 lbs. a week; 6, Man and wife with six children under 16 years, to buy 13 lbs., and so on, increasing 2 lbs. a week for every child over 6 and under 16 years of age. The reason for prohibiting a person in receipt of parish relief from purchasing any Rice is, that as in this union the relief is given partly in kind, bread and flour, the price of these articles to the recipient is a matter of indifference, as whether the bread is 6*d.* or 10*d.* a loaf he has his bread. The reason for the second rule is obvious, that with only two children, and the present rate of wages, the aid of charity is not so much needed. If these statistics in your estimation are like to be of use, you will perhaps give them publicity. One advantage I think in this way of administering relief is, that the Rice being sold and not given away, the feeling of self-dependence is not materially weakened in the poor man; and another advantage is that children, who are the great sufferers in these dear times, need not, and do not, go without a daily supply of food well suited to them.

—*A Country Curate.*

Backward Agriculture.—Excuse me taking the liberty to ask you through the medium of your widely-circulated paper, how it is that we see in travelling through almost every county in England so much land wretchedly cultivated in the middle of the 19th century, and in this boasted age of agricultural improvements. I will thank you to tell me who are to blame, whether the landlords or the tenants, and what remedy you would propose for that great national evil. *A Correspondent.* [You must study Mr. Mechi's writings on the subject!]

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Weekly Council, *Feb.* 28.—Mr. Miles, M.P., President, in the chair.

Shedding.—Mr. Jonathan Gray's model of an economical mode of constructing shedding for agricultural and other purposes was submitted to the Council; and, in the absence of the inventor (through illness) explained to the members by the President. The framework consisted of rows of upright posts, consisting of barked larch poles, let into holes in the ground made by an auger, and held securely in their upright position by longitudinal and transverse metallic wires, ropes, or rods passing over their tops, and carried, like the chains of a suspension-bridge, on each side into the ground, where they were firmly moored and kept at their full stretch. The canvas awnings, by which the frame-work was covered, were secured in their position on each side of the shedding by elastic holders, which accommodated themselves to the varying strain and dimensions of the canvas, keeping it constantly at even tension. Though intended in the first instance only for agricultural purposes, especially as a convenient awning for the exhibition of live-stock and implements at agricultural societies, the principle of arrangement proposed by Mr. Gray would be equally applicable to the construction of tents, field hospitals, or other portable and temporary coverings for out-door purposes.—The President also explained to the members the ingenious minor contrivances adopted by the inventor in the details of his plan for rendering his arrangements complete.—The thanks of the Council were ordered to Mr. Gray, for the trouble he had himself taken in submitting his invention to the notice of the Council.

Australian Wheat.—The South Australian Local Committee for the Great Exhibition of 1851 transmitted to the Council a portion of their sample bottles of Adelaide grain received back from the Royal Commissioners at the close of the Exhibition. Sir Matthew White Ridley, Bart., informed the Council (in a letter addressed to them in August last), that although the Australian seed-Wheat had not succeeded well with some of the members who had tried it, he was himself partial to it as a Wheat after Turnips in his district in Northumberland. He had previously had good crops of it and a good sample; and had that year (1854) again a superb crop of it, from the produce of the small quantity he had received at a Council meeting six or seven years ago. He had of course changed the land on which he had grown this particular Wheat.

Stoppage of Drains.—Mr. Frere, of Roydon Hall, Diss, Norfolk, having frequently had his improvements checked by the stoppage of drains on his property, occasioned by fibres from the roots of trees, had recently met with a plan which appeared to him as likely to prove a radical cure of the evil in question. It was contained in Mr. Brown's second edition of his work entitled "The Forester," in pages 132—4. Mr. Frere had adopted the plan proposed, to a small extent, as an experiment, the result of which he would in due course report to the Council. In the meantime, he thought that some other members of the Society might possibly be induced to join him in the trial during the ensuing spring. He suggested that Mr. Brown would, perhaps, on application to him, kindly supply the result of his own experience of the plan he had proposed, during the four years that had elapsed since the second edition of his work had appeared. Mr. Brown's shut drain among trees is 48 inches deep, 12 wide at the top and 9 at the bottom. In filling the drain, he recommends rough gravel to be put in for the first 8 inches from the bottom, on which a sole of slates is to be laid for the drain tiles to rest upon, leaving between each sole a vacancy, or chamber, of 1 inch deep. The tiles being laid, are to be surrounded with a puddle of good clay 3 inches thick on each side, and the same over the top of them. This covering of clay, he conceives, will prevent the fibres descending into the tiles, while the current of water filtering through the gravel will induce them to remain below them, the chamber between the soles being intended to receive any superabundant water that the bed of gravel might on any extraordinary flow be unable to contain. Mr. Brown considers that such a drain would keep good for 50 years.—Sir John Johnstone feared that such drains would be double the expense of those constructed in the ordinary way.—Mr. Paine had been in the habit of using double tiles for the purpose proposed, and these were found fully to answer the purpose.

Cock's-foot Grass.—Communications on the value of the *Dactylis glomerata* were received from Miss Banister, of Steyning, Mr. Graburn, and Mr. Scott. Miss Banister's paper referred to her own experience in the cultivation of that Grass, and to the various specimens she had forwarded from time to time to the Council; Mr. Graburn's, to his comparison of the Cock's-foot with the Italian Rye-grass, for forcing purposes, and to a regular series of experiments on the productive powers of various Grasses by means of irrigation, in which he was about to engage, and of which he would furnish to the Council the detailed result; Mr. Scott's, to information on the value of the Dactylis glomerata, given by Mr. Fulton in his prize essay in the Highland Society's Transactions for October, 1853, and to Mr. Lawson's work on Grasses.—Dr. Calvert remarked that the Cock's-foot Grass took the lead of the other Grasses after mowing until the frost set in, when it was destroyed. He preferred the Tall Fescue (Festuca elatior), which came in earlier, and continued later, being at the same time ravenously preferred to all other Grasses by the cattle and horses. He was sorry that the Fescue in question had not been one of the Grasses examined by Prof. Way in his valuable paper in the Journal. A full account of its merits would be found in Sinclair's well known work. Prof. Way's specimens had been supplied to him by Mr. Bravender, of Gloucestershire, who considered the Cock's-foot as one of those Grasses that indicated good land; and it had been found by Prof. Way's analysis to stand at the head of the list of the Grasses supposed to be nutritious chemically speaking, Professor Way not having ascertained practically how far its flesh-forming constituents were free or controlled by other circumstances in the actual feeding of animals. —Sir John Johnstone thought the Cock's-foot very good as a bite for the second year. Much of its value depended on its cultivation, the Grass being coarse under those circumstances in which its management was neglected.—Dr. Calvert has devoted a lengthened period to the selection and cultivation of the different Grasses, and he hoped in a few weeks to be able to draw up for the Society a report of his results.

Analyses of Manures.—Mr. Bethell having called the attention of the Council to the necessity of the Society's publishing a table showing the proportion of nitrogen and ammonia, and of the phosphates and alkalies in the different substances, whether natural or artificial, used as manures, the President, Professor Way, Mr. Slaney, Sir John Johnstone, Mr. Paine, the Rev. L. Vernon Harcourt, and Mr. Raymond Barker addressed the Council on the importance of the data which such a table would furnish to the farmers of the country, in their estimation of the market value of a manure, and of its adaptation to their particular soils; and the Council referred the recommendation to the Chemical Committee of the Society.—The Council having referred a paper by Mr. Templeton, on Turnip Feeding, to the Journal Committee, they adjourned to their monthly meeting on the 7th of March.

Notices of Books.

The Journal of the Royal Agricultural Society of England. Vol. XV., part 2. John Murray, Albemarle Street.

The current part of this work contains more than the usual quantity of veterinary matter. Professor Simonds' valuable lectures on the teeth of the ox, sheep, and pig as indicative of age are reprinted. This and an essay on parturient fever in ewes, by Mr. Seaman, occupy more than one third of the part. The other papers are by Mr. Read, on Oxfordshire farming; by Messrs. Hamond and Barnett, on the implement and live stock departments respectively of the Lincoln show; on Dorsetshire farming, by Mr. Ruegg; on the natural history of the Grasses, by Professor J. Buckman; on the growth of Beans and Peas, by Mr. Vallentine; on cattle feeding, by Mr. Lawrence; and on the influence of lime on soils, by Professor Way. There are two or three other shorter papers of less importance. There is thus the usual variety and fullness which past volumes have exhibited; and there is a great deal to which we shall hereafter direct the attention of our readers.

Probably the most important paper is that by Professor Way. If his further researches shall verify his speculation on the relations of lime to the ammonia-retaining and ammonia-attracting power of soils, they will have a very important influence on farm practice in this particular.

Bulky dressings of lime at lease-wide intervals will be abandoned for the more frequent smaller doses which the Professor recommends, and which are commoner in English than they are in Scottish agriculture.

Calendar of Operations.

FEBRUARY.

Border of the Fens, *Feb. 26th.*—After nearly six weeks of wintry weather, on Saturday the 24th, a welcome change took place in the advent of a gradual, and up to this evening, an uninterrupted thaw, accompanied yesterday and this morning by a moderate fall of rain; our first thoughts are naturally directed to the sheep, seeing that the ewes have a dry lair in the lambing-fold at night, and we have found it necessary to shift the lambhogs from the Turnip field (which is reduced by the effects of frost and rain to a perfect quagmire), and putting them for a day or two into a Grass field, where we shall continue to give them cut Turnips until the land is settled and again fit for their reception. Three or four lambs have already made their appearance, and in another week the shepherd will have his "hulks" full, and his hands full night and day in every variety of early life among the woolly multitude. The chief error to be avoided in this, as in other circumstances, is any tendency to officiousness, as too anxious a desire to render assistance, when not required, has frequently resulted in severe loss to the breeder; time and patience will work wonders; self-possession, care, and adroitness will generally meet those cases of exception which more frequently occur in a new or mixed flock and when in high condition, than where the ewes are natives of the farm and recruited from the owner's young stock; nor is it a light or easy matter to obtain a good flock of ewes of the right stamp, when by the misfortune of disease, accidents, or great mortality, a serious diminution of number should occur. A farmer may pick up a few at a sale, where he generally has to give a high price, or at market, where there is always a risk of getting culled or defective sheep: in short, any one having land suitable for ewes, who may have pursued the raising of sheep for some years, feels great pleasure in gradually modifying and improving his sheep by selecting the theaves that possess those qualities to which he attaches any importance, and it is a great chance if they do not become his favourites—nurtured, chosen, protected, and maintained, that he may in turn be rewarded by their length and weight of wool, early maturity, heavy carcase, and light losses, to compare with his neighbours' luck and help to pay the rent. If sheep breeding is not more practised than of yore, it is at least revived, seeing the good trade that ram-breeders have driven of late; and although it may be profitable for some artists by confinement upon boards and in dark places to make mutton rapidly, yet, to provide for these wholesale feeding gentlemen, it is quite evident that we must look to our pastures, which in pastoral tranquillity graze and will continue, let us hope, to graze the millions of ewes and lambs which are to replenish those arable and fat Turnipy districts made fertile by sheep, and by which our markets are supplied. The thaw and rain are extremely welcome to hundreds of farmers, on the somewhat singular account of a great scarcity of water; many have to fetch water four or five miles for every purpose of the house and yard. It is true that within this space there are many sources of water, but not available to the public, and therefore those who suffer from the scarcity provide themselves from the nearest river or brook, or other reservoir to which free access is attainable. We hear of a man paying 16*s.* a week to labourers for this one purpose of fetching water, besides the expenses of horses and vehicles; another tells you that, do as he will, he cannot get sufficient to keep his stock in health. When many men are unemployed in agricultural parts the farmers are charged as being to blame, whereas if inquiry was instituted it would, we think, be discovered that other callings contribute a larger portion of the people out of work, such as bricklayers, job carpenters, boatmen, and railway labourers, gardeners, porters, higglers, and excavators whether of gravel or stone; whilst work can be found to do on a farm we do not imagine any one who could pay a good labourer would select severe weather to discharge him; at the same time the high price of provisions, joined to deficient earnings, has produced all over the kingdom much privation and suffering; this reacts on trade generally, and a great stagnation is complained of in all departments of business. Would that the bitter experience of winter could make a permanent impression of the value of provident habits, but wherever great ignorance prevails, no matter how high the wages, they go all one way down the throat; but let a little light of a better system but beam upon an industrious

family, improvement, independence, and comfort go hand in hand, the cottager is then prepared to battle with ordinary reverses, and each year sees him increase in determination to be not merely a labourer but ready to avail himself of any opportunity to be an occupier and perchance an employer. Economy may be practised even in littering yards with straw, verily this is a year of consumption in the eastern counties; hay is scarce, Turnips are not plentiful, cake and corn are dear, and the straw—the very straw is disappearing with marvellous celerity; a dry lair is all that is required with as much straw for growing store stock to eat as the allowance of other food will render necessary. It certainly looks well to see horses and beasts up to their knees in a yard full of clean bright straw, but there is something extravagant in it; the only justification of such prodigality with us would be the assurance that more and better manure was made thereby; if not, there is just so much straw wasted, and some more profitable mode of employing it might be sought for. *J. W., Peterborough.*

Notices to Correspondents.

Alsike Clover: *R Robson* asks for any personal experience of Alsike Clover. It is spoken well of. Messrs. Drummond, of Stirling, tell us that 2 or 3 lbs. of it per acre are a great improvement to Italian Rye-grass. Perhaps some one will say whether it is useful as a suitable addition to mixtures for permanent Grass.

Australian Reaping Machine: *An Australian* knows of a machine in use at Adelaide for reaping Wheat, called there Ridley's machine. He wants to know where in England it can be had, with some idea of probable price. It may be as well to say that this machine, as described, not only gathers but threshes the Wheat at the same time. As the machine (propelled by six oxen), proceeds, the stalks of corn enter a large comb, when the ears only are immediately beaten off by a revolving cylinder-shaped apparatus. They then undergo a complete threshing, and the whole is thrown back into a box, which is emptied of its contents at every round made of the field. Any information relative to this subject will have our thanks. It is thought that Mr. Ridley is at present in London. If this should meet his eye, perhaps he will be good enough to communicate with us.

Ayrshire Cows: *Clericus.* We will try to obtain the name of some dealer in Ayrshire cows; but we imagine your plan must be to advertise.

Books: *Kent* says:—"Do, pray, get somebody to tell me what should be expected of a sow, I mean at what period after her pigging she may return to *wash alone*, and if at all?—the wash from a house where the inmates are six and the sow single? What amount of meal, again, the sow with a farrow, say of 10, should consume per week, till the little ones are weaned, and what should be their consumption thereafter? And pray, again, the best mode of managing the little ones, with regard to time of keeping them, and so forth, with some possible profit? You would indeed be doing us "little gentlemen" an inconceivable benefit in telling us something practically on this head. We get, in nine cases out of ten, a bad sort of hermaphrodite—amphibious half-gardener half-cowman sort of fellow—who knows nothing, and, finding we know less, does us to a great extent. *J H.* [Try Richardson's "Rural Handbook" on the Pig, price 1*s*.]

Diseases of Cattle, &c.: *W W.* "The Ox," by the Society for the Diffusion of Useful Knowledge, is still a very good book.——We would grow Rye-grass on a stiff soil. "*W W.*" asks for a receipt to pickle bacon as in Norfolk.

Fowler's Steam Draining Plough: *Mr Scott* informs us that this implement, much improved, is now at work daily on the farm of Mr. Grant, Wormleybury, near Broxbourne, Essex, and that gentlemen interested in drainage are invited to inspect its operation. There are now 13 horse ploughs and three steam ones at work in different parts of the country, and upwards of 10,000 acres have been drained by them.

Hereford Stock: *H Allington.* We do not know of any dealer to whom to direct you, nor are we personally acquainted with any breeder of Hereford stock to whom we could introduce you: we imagine your best plan is to go to one of the Hereford fairs, and you will easily learn to whom you had best apply for a fresh bull as a cross for your cows.

Italian Rye-grass: *Anon.* It will not do to sow it now among thin Wheat. The Wheat would be utterly choked long before it came to ear. We did that once and that was an experience. If you sow among Wheat at all sow it early in May, as the last time you dare go among this crop with the hoe and hoe it in. It is quite possible that your half germinated seed may have been killed; if so, just go over the ground with the tine seed harrow again, and follow it up with the brush harrow, and that will ensure a crop. There will be a full account of the crop given next week.

Manures: *S phosphate.* We do not know in what published work you will obtain instructions for making "all mineral manures." For making superphosphate consult past indices of the *Gardeners' Chronicle.* Professor Way, in England: Professor Anderson, in Scotland; the one the chemist to the English Agricultural Society—the other the chemist to that of Scotland. We must not name agricultural machine makers—there are numbers of firms able to give you satisfaction.

Pigeons: *Anon* and several others ask an "Old Subscriber, Durham," to state the origin of his "laughing pigeons," and what breed they resemble in plumage, size, &c. They would be glad to communicate with him on the subject

Radish: *Cor.* We do not know the Black Winter Radish at all as an agricultural plant, but will make inquiry.

Rape-cake: *F A.* If you cannot get it cheaper than Bean-meal [!] you should not use it. It is to be had for less than 5*l*. a ton at Hull. Rape-cake contains about one-third its weight of protein compounds corresponding to the fleshy part of animal matter, and one-tenth its weight of oil. Barley contains one-eighth its weight of the former, and two-thirds its weight of starchy matter, &c., corresponding somewhat to the latter. Beans, again, contain one-fourth their weight of the former, and more than half their weight of the latter. But Rape is probably not efficient up to the measure of its value theoretically, because it is generally distasteful to animals; and unless it can be had much cheaper than Beans we would not buy it.

Refuse from Brewery: *A Subscriber.* What is it? We last week saw the refuse "dreg" of a distillery—so much of it as the cows refused or lost—running into a tank, into which their urine also ran, whence it was pumped over Italian Rye-grass. This was at Hundred Acre Hill, near Glasgow, where Messrs. Harvey have 600 or 700 cows fed on grains and dreg, and steamed Turnips and hay. "Dreg" is the liquid remaining in the still after the whiskey ceases to come over.——We would not mix lime with manure containing ammonia.

Seeds: *H. Treacher.* You will find tables of the quantity of the different sorts of seeds needed per acre in many agricultural price lists, in the Agricultural Almanacks, &c.; or if you will name what you want we will give it you here.

Sundries: *E F.* Oyster shells contain but little phosphate of lime, and will be of little more value after being acted on by sulphuric acid than so much gypsum would. Sulphate of soda has been applied with usefulness, especially to Potatoes, and 60 or 80 lbs. per acre might well be added to any guano, soot, or other appropriate dressing for that crop. You cannot compare it with common salt. It may be of great value, or it may be valueless, according to the circumstances of the soil. Your case may be as that of a builder who cannot get on for want of window nails, or putty. It would be of little service to him in such a case to discuss whether freestone at 1*s*. per cube foot or Oak at 3*s*. 6*d*. were the dearer.

The Oat: *A Subscriber.* We do not believe the extraordinary account of which you have heard. To get a Rye crop you must sow Rye seed!

The Pig: *H J E.* The shilling hand-book on the Pig will, we dare say, serve your purpose.

GRASS SEEDS.

SUTTON'S GRASS SEEDS (Carriage Free). NATURAL GRASS SEEDS FOR PERMANENT PASTURES, separate or mixed, expressly to suit the soil.—Messrs. Sutton and Sons having for many years paid especial attention to the examination of Natural Pastures, and the collecting of the Grasses which thrive in the various soils of Great Britain and Ireland, are enabled to supply the sorts and quantities of Seeds, varied to suit the soil for which they are intended. The cost will vary from **24s.** to **30s.** per acre, according to the sorts and quantities the soil requires.

FINE LAWN GRASS SEEDS, for making New or improving Old Lawns, price **1s.** per pound, 2*s*. 6*d*. per gallon, or 20*s*. per bushel. For forming new Lawns, 2½ bushels, or 50 lbs., is the quantity required per acre.

FINE GRASS AND CLOVER SEEDS FOR IMPROVING OLD PASTURES (Sutton's Renovating Mixture). Quantity required per acre, 8 lbs. to 12 lbs. **price 9d.** per lb.

N.B. *It will be seen above that we have greatly reduced the prices of our Grass Seeds this season, especially the fine Lawn Seeds and* "Sutton's *Renovating Mixture" for improving Meadows and Pastures; and we doubt not that our liberal charges will induce a more general practice of sowing our superior kinds of Grass Seeds. Priced Lists sent post free.*

Sutton & Sons, Seed Growers, Reading, Berks.

MESSRS. E. G. HENDERSON and SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out April 30, 1855, the following new Seedling FUCHSIAS, raised by Messrs. Story and Banks.

Queen Victoria (Story's), scarlet, with white corolla. 10*s*. 6*d*.
Prince Albert (Banks's), fine violet corolla. 10*s*. 6*d*.
Perrugino (Story's), fine striped corolla. 10*s*. 6*d*.
Empress Eugenie (Story's), rosy crimson, white corolla. 10*s*. 6*d*.
Ranunculæflora (Story's), fine double white corolla. 21*s*.
Lady of the Lake (Story's), blush, white corolla. 10*s*. 6*d*.
Water Nymph (Story's), globe-flowered, fine white corolla. 10*s*. 6*d*.
Raffaelle (Story's), beautiful variegated corolla. 10*s*. 6*d*.
Mrs. Story (Story's), fine white corolla. (In accordance with Mr. Story's wish, this was named after Mrs. Story, as it was in his opinion the finest.) 10*s*. 6*d*.

Or if the set of Nine are taken, the price 4*l*. 4*s*., including SNOWDROP (Story's). This was received from Mr. Story as possessing a double white corolla, and described by himself and others who saw it in flower as a very beautiful variety. It was the first double white raised by him; but the plant did not flower in the Wellington Nursery after it was received by Messrs. Henderson; and through three stout branches having been broken off it it did not quite correspond with the description given by Mr. Story and others a few months after to Mr. A. Henderson when at Newton making inquiries respecting the Plants. Consequently no charge will be made for it, but one will be presented with every set ordered.

FUCHSIA, BANKS'S FAVOURITE (BANKS), considered the finest of the blue violet corollas. 10*s*. 6*d*.

For further particulars see page 62 of the *Gardeners' Chronicle* for Jan. 27; or a list will be sent post free on application.

Messrs. E. G. HENDERSON & SON having purchased of the late W. Story, Esq., of Newton, in the county of Devon for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, which new feature in this tribe he succeeded in introducing, and in consequence of an advertisement which appeared in the *Gardeners' Chronicle* some few weeks back from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, and after a written communication with that gentleman it was thought necessary for one of the firm to make further inquiries about them, and in consequence Mr. Andrew Henderson went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of a great number of their customers throughout the autumn having ordered plants of them at higher prices than are above quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to the above.

Messrs. E. G. HENDERSON & SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their patrons and the public that their New Catalogue of Seeds for 1855 is now ready, with full descriptions and other information, and will be forwarded post free on application.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

Per packet—	s.	d.
Antirrhinum, extra fine ...	0	6
Auricula, fine mixed ...	1	6
Abronia umbellata	1	6
Anagallis azurea grandiflora	1	0
„ rubra „	1	0
Arctotis breviscapa ...	0	6
Aster, new Peony pyramid, in packets of 10 distinct colours, separate ...	3	6
„ new bouquet pyramidal, in packets of 12 distinct colours	3	6
Balsam, double Camellia-flowered, in packets of 6 distinct colours, separate	3	0
„ new double Camellia Rose, in packets of 10 distinct colours, separate, extra fine	5	0
„ Aurora, new double crimson	1	0
„ new dble. pale yellow	1	0
Carnation, stage flowers...	1	6
Calceolaria, ex. ex. 2*s*. 6*d*. & 5*s*.		
Cineraria, ex. ex. 1*s*. 6*d*. & 2*s*. 6*d*.		
Chrysanthemum pompone	1	0
„ large flowered	1	0
Calendrinia umbellata ...	0	6
Dianthus Dunnetti, suprb.	1	0
„ Chinensis flora pleno, extra fine...	0	6
Eschscholtzia tenuifolia...	1	6
Geranium, choice show ...	2	6
„ choice fancy	2	6
Hollyhock, first quality ...	2	6
„ second quality ...	1	0
Ipomœa rubro cærulea ...	1	0

Per packet—	s.	d.
Ipomœa limbata	2	6
Leptosiphon luteum ...	0	6
„ aureum	1	6
Linum grandiflora rubrum 1*s*. 6*d*., and	2	6
Lobelia Queen Victoria (scarlet)	0	6
Lobelia Roi Leopold ...	0	6
Larkspur, new double improved Hyacinth flowered, in packets of 6 distinct colours ...	2	6
Limnanthes sulphurea odorata	1	0
Mignonette, new, large ...	0	3
Mimulus, beautiful ...	0	6
Pansy, choice show ...	1	6
„ choice fancy	1	6
Petunia, extra fine ...	1	0
Phlox Drummondi coccinea	0	6
Portulaca, new orange ...	0	6
„ new rose	0	6
Primula sinensis fimbriata, alba and rubra mixed ...	2	6
Poppy, new large Pæony, in 8 brilliant colours ...	2	0
Reseda myriophylla, new Mignonette	1	0
Salpiglossis, scarlet, blue, and sulphur	0	6
Stock, German, new large flowering, in packets of six distinct colours ...	2	6
Verbena, choice mixed ...	1	0
Sweet William, new double	0	6
Whitlavia grandiflora ...	1	6

Lilium giganteum seed, 2*s*. 6*d*. and 5*s*. per packet.
Holcus saccharatus (new Sugar-cane), 1*s*. to 2*s*. 6*d*. do.
Dioscorea Batatas (Japanese Yam), 2*s*. 6*d*. each tuber.
20 Ornamental Grasses (see Catalogue).
12 Ornamental foliage Annuals.—March, 1855.

MESSRS. WILLIAM ROLLISSON and SONS beg to inform their Patrons and the Public that their NEW CATALOGUE OF SEEDS for 1855 is now ready, and will be forwarded post free on application.

W. R. & Sons embrace this medium of stating that many of the Seeds most difficult to obtain true, such as Beet, Lettuce, the Brassica tribe, &c., &c., are of their own saving, and the others have been procured from growers of the highest reputation; particular attention having been paid to secure the German Flower Seeds from eminent sources; are therefore able to state with confidence that the whole of their seeds are of very superior quality. W. R. & Sons respectfully invite attention to the following Choice Flower Seeds, selected from their Catalogue:—

	s.	d.
Alonsoa Warscewiczi, a beautiful half hardy annual, of graceful habit, with spikes of scarlet flowers	2	0
Arctotis breviscapa, a free flowering showy annual from the Cape	1	0
Aster, new Pæony pyramidal, in collections of 12 distinct colours	3	6
Aster, dwarf bouquet, or nosegay	3	6
Canna Warsewiczi, ornamental foliage plant	1	6
Centauridium Drummondi, orange coloured, very showy ...	0	6
Chenopodium atriplex, ornamental foliage plant	1	6
Clintonia pulchella, a lovely little blue flower	0	6
Coreopsis coronata, bright yellow, free flowering	0	6
Dianthus Dunnetti superbus, double Sweet William, of brilliant colour and dwarf habit	1	
Digitalis (Foxglove), extra choice, saved from a collection of splendid spotted flowers	1	6
Elichrysum compositum maximum, large double flowers of many colours	1	6
Eschscholtzia tenuifolia, straw coloured, very distinct ...	1	6
Eucnida bartonioides, yellow, very beautiful	0	6
Gypsophila muralis, red flowers, very neat	1	0
Helianthus angophyllus, silvery foliage, very ornamental ...	2	6
Hibiscus Thunbergi, yellow, showy	0	6
Ipomœa limbata, a tender climber, Tyrian purple, with white margin, beautiful...	2	0
Lilium giganteum	5	0
Limnanthus sulphurea odorata, yellow, edged with white ...	1	6
Linum grandiflorum rubrum, a large bright crimson Linum from Algiers, with brilliancy of colour and style of flower which surpass three-fourths of the usual pot plants used for decorating the conservatory	2	6
Pansy, extra choice, saved from superb flowers	2	6
Phlox Drummondi, extra fine, mixed	0	6
Primula sinensis fimbriata, alba, and rubra, saved from superb flowers, each	2	6
Reseda myriophylla, a very distinct new Mignonette ...	1	0
Sabbatia campestris, fine rose with yellow centre, really beautiful	1	0
Stock, dwarf double autumn flowering, in collections of 12 distinct colours	3	0
Stock, new large flowering German, in collections of 12 distinct colours	3	6
Tropæolum Lille Schmidt, good for winter blooming ...	0	6
Vittadinia lobata, pink, very compact and dwarf	1	0
Whitlavia grandiflora, large dark violet bell-shaped flowers	1	

Messrs. W. Rollisson & Sons are desirous of directing especial attention to their fine Collection of Fruits, which contains all the choicest varieties in cultivation. The rare Cymbidium eburneum is now in blossom and can be seen at the

Nursery, Tooting, London.—March 3.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

GARDEN ORNAMENTS.—Several Hundreds of VASES, FIGURES, and SUN-DIAL PEDESTALS, which have stood wholly exposed to the late frosts, may now be inspected at

AUSTIN and SEELEY'S Show Yard, Keppel Row, New Road.

☞ A few articles which have been standing as patterns for many years will be sold at reduced prices. Any gentleman unable to visit the yard may have sketches sent, if he will describe the object required, and the price.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 16*s*. per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and loam at moderate prices.—Kennard. Brothers, Swan Place, Old Kent Road.

THE CURVILINEAR FLOWER BASKET.

As Suspended in the Nave and Transepts of the Crystal Palace.

W. COGGER, ORNAMENTAL WIRE WORKER TO THE CRYSTAL PALACE, respectfully informs the Nobility and Gentry that he was the Only Manufacturer of those useful and ornamental appendages to the Conservatory under the direction of Sir Joseph Paxton, M.P., who has given him permission to take orders from the original designs. Sketches and Estimates furnished for Rose Temples, Aviaries, Verandahs, Garden Arches, Arbours, Flower Stands for the Conservatory or Drawing-room of first class workmanship, and at the lowest possible price. See specimens, Hardware Court, Crystal Palace.

Manufactory opposite the Church, Sydenham, Kent.

FLOWER POTS and STANDS of all kinds, including Suspension and Bracket, of the most approved shape. Classical, Italian, and Grecian Vases, Pedestals, Fountains, &c., in stock. Prices for 1855 forwarded on application to

William Maule & Sons, Horticultural Potteries, Bristol.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—Maw & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING or SALTING MACHINE for GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by Alexander Shanks & Son, Arbroath, Forfarshire, from whom particulars with prices may be had

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street, Westminster.

SHEET GLASS (15 oz.) of good quality in 100 feet boxes.

10 in. by 8 in. and under	... ...	15s. per box.
11 in. by 9 in. to 22 in. by 14 in.	... ...	17s. "
Larger sizes to 28 in. by 18 in.	... ...	19s. "

Also similar sizes in 21 oz. Sheet at 24s. per box. Boxes charged 2s. each, and returnable at the same price, if delivered free. JAMES PHILLIPS & Co.,
116, Bishopsgate Street Without.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HETLEY and CO. are supplying 16-oz. Sheet Glass of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

Sizes.—Inches.		Inches.		Per foot.		Per 100 feet.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

TO GARDENERS AND OTHERS.

THE BRIDGEWATER FIRE AND WATER-PROOF MINERAL PAINT.—An Important Discovery.

This substance is a vein of earth found only in one of the Bridgewater Mountains of New Jersey, in the United States. It is the most extraordinary paint offered to the public, possessing new and valuable properties, and applicable to a variety of purposes. Its colour is dark red, never fading or changing in the hottest climates. When mixed with any other paint, the colour produced by that mixture will be rendered unfading also. After it has been applied and exposed to the atmosphere a few months, it becomes fireproof, and as durable as stone. Wherever it is applied neither rain, sea-water, nor damp can penetrate; thus preserving iron from rusting, wood from rotting, and brickwork from damp. It will endure intense heat without cracking or blistering. It has also the property of flexibility; Canvas, Tents, &c., covered with it become waterproof, retain their previous flexibility, and are not liable to crack when they are rolled up. Coarse Wrappers, covered with two coats of it, are an excellent substitute for Russian mats, to cover gardeners' pits and frames, or to protect wall fruit trees, being cheaper and more durable. If two coats of it be applied to trees, above and below the ground, where the borer generally enters, it will prevent the attack of that destructive grub, or insects of any kind; a new bark will be formed under the paint and the trees kept in a healthy condition. It is spread out easily, and does not emit any unhealthy effluvium.

A specimen of the paint on coarse wrappers for Gardeners and others may be seen at J. Le Cren's, House-painter, 26, Moorgate Street, who undertakes to supply Gardeners and the public with any quantity of painted wrappers at moderate prices.

Sole Consignee for the United Kingdom, Joux Eives, 17, Cornhill, London. Sold by Agents in most of the principal towns of the United Kingdom. In London by L. Frank & Son, Oil Merchants, 14, Borough, London Bridge, of whom may be had Quick Drying Oil to mix with it, for use during the winter season, and also Testimonials in its favour from Shipowners, Builders, Painters, &c.

HOT-WATER PIPES at wholesale prices, with Elbows, Syphons, Tee Pipes, and every requisite connection. Cast Iron Boilers, 55s. each. Improved Soot Doors and Furnace Doors. Builders' Castings of every description kept in Stock at — Mr. LYNCH WHITE'S, Old Barge Iron Wharf, Upper Ground Street (near Blackfriars Bridge), London.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, Hothouse Builder, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HALL'S GARDEN NETTINGS; the best and cheapest for all purposes of shelter and shade from Frost, Hail Storms, and Gales of Wind. No. 0, 5d.; No. 1, 5½d.; No. 2, 6d.; Nos. 3 and 4, 7d. All 56 inches wide, and in lengths of 10, 20, 30, and 60 yards.—Manchester.

SPADE FARM—WARWICKSHIRE.

Within Four Miles of Warwick and Six of Leamington, about a Mile and a Half from "Hatton Station" on the Great Western Railway, where 13 Trains stop Daily.

TO BE LET, unfurnished, or partially furnished, for the residue of a Lease terminating Michaelmas, 1859, and which can probably be renewed, NORTON LODGE, in the above most eligible situation, contains four Reception Rooms; Five best Bed Rooms, with Three Dressing Rooms; Bath Room; Five Servants' Bed Rooms, and Capital Offices. Stabling for Six Horses, Coach House, Gardens, and Pleasure Grounds, &c. In addition to the House and Grounds there are about thirty-five Acres of fine Land, of which half is arable, under the plough and fork, deeply tilled, and perfectly clean. Five acres are cultivated on the Lois-Weedon Wheat system. The House is on a good elevation, commanding an extensive view of the surrounding country, is in the most complete order, a large outlay having been made both by the proprietor and the present occupier. The Lease is on favourable terms.—Apply to Messrs. Cookes, Sons, and Meres, Estate and House Agents, Auctioneers, &c., 34, Warwick Street, Leamington.

TO BE SOLD, by private treaty, a NURSERY and PLANT BUSINESS, established nearly 70 years. The Proprietor of this old-established Nursery Business is willing to retire, and dispose of the Stock and Good-will. The nursery comprises about 20 acres of ground, and about 15 large and commodious Stove, Greenhouse, and Propagating Houses, with numerous Pits, frames, &c. *The business is in full working order, and is capable of being increased to almost any extent, and of being made one of the best provincial nurseries in the kingdom.* The stock is in a flourishing condition, being young, healthy, and in good saleable order, and comprises a general assortment of all the most saleable Forest Trees, Shrubs, Fruit Trees, Stove, Greenhouse, and Miscellaneous Plants. The Nurseries are situated close and adjoining one of the largest towns in the West of England, with a population of more than 100,000 inhabitants. The whole of the land, houses, &c., belongs to the proprietor, *who will have no objection to grant a long lease to his successor or successors, and at least one-half of the purchase money could remain on security at common interest.* The business has been carried on with great success by the present proprietor, which partly contributes to his retiring from the business. None but principals and *bonâ fide* purchasers will be treated with.—Address in the first instance, A. B. C., Office of this Paper.

NURSERY AND SEED BUSINESS,
Established in the Year 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Growth and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.—Apply to Mr. Young, the Proprietor, Elm Cottage, Taunton.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Gauze, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

DORKING FOWLS.—Eggs, from remarkably large and weighty birds, of the best coloured breed, will be disposed of at 15s. the dozen, box included.—Address W. G., Railway Inn, Holme, Stilton, Hunts.

COLOURED DORKINGS.—EGGS, from coloured Dorking Fowls, which have taken prizes and been commended at Reading, Cambridge, Norwich, and Colchester Shows at half a guinea the setting of 13; also Eggs from prize Buff Ayrean Ducks at the same price.—Apply to Rev. E. H. Kitton, Chadwell Rectory, Grays, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, March 8th, at 12 o'Clock, about 200 choice double Camellias, from 18 inches to 5 feet, comprising all the approved kinds, beautifully furnished with bloom buds; 100 very strong Camellia Stocks; also a choice assortment of Standard and Dwarf Roses; a fine collection of American Plants; choice Dahlias in dry roots; Pœonias, Verbenas, Fuchsias, &c.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHER PUBLIC COMPANIES ENGAGED IN PLANTING.
Clearing the Ground for the Woodford and Loughton Branch Railway.

PAGE AND CO.'S

COMPOSITION FOR THE DESTRUCTION OF BLIGHT.

ADVERTISEMENT CONTINUED FROM PAGE 144.

From the Rev. E. T. Richard, Farlington Rectory.

As the season is now drawing to a close, I can assert that the Blight Composition I had from you in the summer has been of the greatest benefit to my trees; it seems to have perfectly stopped the spread of a parasitic fungus which had infested a large Vine for six or seven years; the infested leaves, although marked by the fungus, have become perfectly healthy; in short, the Vine presents a very different appearance from that of last year at this season. I have some Plum trees which were greatly infested with aphides, but the Composition has restored their appearance.—Oct. 11, 1852.

From J. Staples, Esq., Belmont House, Salisbury.

I have tried your Composition, and am very much pleased with the result, my fruit trees having quite recovered the excessive blight that affected them early in the season.—August 11, 1852.

From Mr. Wilkins, Gardener to H. F. K. Holloway, Esq., Marchwood Lodge.

I highly approve of your Composition, as it answers admirably, saving my wall trees from an untimely death, and quite recovering my Roses, killing every insect it touches in an instant. I intend to have a quantity of it this season for all my plants.—May 21, 1851.

From Mr. J. Allen, Gardener to the Right Hon. Sir Francis Thornhill Baring, Bart., Stratton Park.

My Peaches and Nectarines were sadly infected with blight, but after syringing them according to your directions, it quite disappeared, nor have they had a blighty leaf upon them since. I tried it on two large Orange trees which had the green-fly very bad, and it destroyed it immediately, nor has it been seen on them since, and the trees are now in a healthy flourishing state. I shall continue to be a customer, as I believe it to be a never-failing remedy.—Oct. 12, 1852.

From Mr. J. Thorn, Gardener to Sir Charles Taylor, Bart., Hollybrook.

I am satisfied of the efficacy of your Blight Composition.—Aug. 11, 1852.

From Mr. D. Forbes, Gardener to G. E. Eyres, Esq., Warrens.

I am happy to bear testimony to the great utility of your Blight Composition in the destruction of brown scale and red spider, in the hothouses and upon the open wall.—Oct. 6, 1852.

From Mr. W. Wilson, Nurseryman, Wimborne.

The gentlemen for whom I procured the Blight Composition have told me that it effectually killed the blight.—Aug. 9, 1852.

From Mr. F. Haslar, Gr. to the Rev. W. Fitzhugh, Bannister Lodge.

I beg to recommend your Composition for killing Insects and blight on wall trees; I have used it on the Peach and Nectarine, and found it of great service, as my trees had the blight last spring, but recovered and made some excellent wood.—Nov. 2, 1852.

From Mr. W. Robbins, Gardener to W. Beach, Esq., Oakley Hall.

I have used your Composition with one-third water, and it killed green-fly, and without water it destroyed thrip.—Nov. 4, 1852.

From Mr. J. Menzies, Gardener to J. Groves, Esq., Ferne Park.

I highly approve of your Composition, which is most destructive to all sorts of aphis. With one application I perfectly cleared my Cherry trees, and intend in future to avail myself of it.—Oct. 12, 1852.

From Mr. Pullinger, Gardener to Mrs. Watson, Brookfield Lodge.

I have given your Composition a fair trial upon Roses, fruit trees, and greenhouse plants, and am much pleased with the results: my fruit trees are perfect pictures.—Oct. 21, 1852.

From Mr. A. Hibbard, Gardener to T. Hill, Esq., Fir-grove.

Your Composition has completely killed the "Mealy Bug," which was very strong upon some imported Orchids, &c., without the least injuring flowers or leaves.—Feb. 10, 1853.

From Mr. Smith, Gardener to the late Mrs. Preston Hulton, Barnfield.

Your Composition has been tried by me, and I am glad it has proved so good for killing all insects, and making the trees healthy for bearing, which is a great point; it is excellent as well for Cucumbers."—Nov. 5, 1852.

From Mr. A. Menmuir, Gr. to Spencer Smith, Esq., Brooklands.

I have given your Blight Composition a trial, having had it applied to the fruit trees here (which were very much blighted), and I am happy to say with very good success, for although some of the trees are very old, they are very much improved by its application.—Nov. 8, 1852.

From Mr. J. E. Froud, Gardener to General Blunt, Barnfield.

After the first application of your valuable Composition to my Peach and Nectarine trees, I found every insect dead, and in a week the trees were healthy and growing vigorously. I also tried it upon Pelargoniums and Cactus in blossom, covered with green-fly, which were all killed instantly, and the blossoms remained as fresh as ever.—Oct. 19, 1852.

From Mr. W. Hocking, Gardener to J. J. Briscoe, Esq., Fox Hills.

I have great pleasure in bearing testimony to the efficacy of your Blight Composition; it has killed the blight in every instance, and the wall trees quickly regained a fine healthy foliage. For Roses and greenhouse plants it is equally efficacious, killing the blight without injuring the foliage.—Oct. 18, 1852.

From Mr. J. Bowen, Gr. to C. C. Codrington, Esq., Dean House.

My wall-fruit trees were dying from excessive blight, but after two syringings with your Composition they quite recovered, and made some excellent wood. For my Roses also it did the same, or I should not have had a blossom open; it is both a cheap and an effectual remedy, which no gardener should be without, and it is equally adapted for pot plants.—Oct. 22, 1852.

From Mr. J. Ratty, Gardener to G. L. Baker, Hartley Grange.

I have used your Blight Composition on wall trees, and find it an invaluable specific against blight.—Nov. 14, 1852.

From Mr. G. Lush, Gardener to W. Betts, Esq., Bevois Mount.

My Peach trees were attacked with brown scale, after the fruit was gathered, for which I applied your Composition, which perfectly destroyed it; I also tried it on some Stove Plants with the same effect.—Nov. 25, 1852.

From Mr. Thomas Bundey, Gardener to the Rev. F. Beadon, North Stoneham.

Your Composition is most destructive to all the insect tribe. With me it has proved itself very valuable, instantly removing all insects without the least injury to the plants.—Dec. 2, 1852.

From Major Munday, Hollybank.

Major Munday encloses Messrs. Page & Co. postage stamps in payment of a jar of Composition, which he has found highly efficacious.—May 26, 1853.

From Mr. E. Minnett, Gardener to General Gilbert, Tweed.

Your Composition has proved very effective upon Cucumbers, Melons, and Peaches. I consider its merits will bring it into general use.—Aug. 17, 1853.

From Mr. J. Taylor, late Gardener to Chas. Twynam, Esq., Portswood.

I am glad to bear testimony to the great utility of your Blight Composition for the destruction of mealy bug, brown scale, and red spider.—Aug. 19, 1853.

From Mr. Chas. Gosling, Gr. to W. Iremonger Esq., Wherwell Priory.

I have found your Composition have great effect upon red spider, green-fly, &c.; it also produces a luxuriant growth. For eight years I have suffered from blight, which could not be got rid of until this season, when one application of the Composition entirely destroyed it. For the future I hope to use it in all cases.—Aug. 21, 1853.

From Mr. H. Cull, Gardener to the Rev. H Brine, Boldre.

I have this season made use of your Blight Composition, and found it effective in extirpating green-fly from Cucumber Vines, without injury to the plants.—Sept. 13, 1853.

From Mr. G. Mitchell, Gardener to W. W. Whitmore, Esq., Dudmaston Hall.

I am very happy to inform you that your Composition has turned out quite satisfactory. I tried it on the Peach trees in the houses, and wherever it touched, every leaf became clean and healthy. You will please send me two gallons in the spring.—Sept. 17, 1853.

From Mr. W. White, Gr. to W. Hans Sloane Stanley, Esq., Paultons.

I consider your Composition valuable for the destruction of insects of all kinds.—Sept. 20, 1853.

From Mr. E. Spivey, Gr. to W. Hobloun, Esq., Hallingbury Gardens.

I was much pleased with your Blight Composition; I applied it to my Cucumbers for the thrip, and glad I am to say that it drove them completely out of the house, and the plants did well afterwards.—Sept. 24, 1853.

From Mr. G. Gaiger, Gardener to J. Corrie, Esq., Southington House.

The Blight Composition effectually destroyed the Bug. Should my Vines be again attacked, I should use your Composition above anything.—Sept. 27, 1853.

From Mr. James Moore, Gardener to Miss Garnier, Wickham.

I found your Composition answer perfectly well for the destruction of green-fly upon Roses, &c.; better than the strongest tobacco-water, and much more economical. I shall thank you to send me another supply in the spring.—Oct. 8, 1853.

From Mr. B. Smith, Gr. to R. Goslin, Esq., Botleys Park, Chertsey.

I have given your Composition a fair trial, and am perfectly satisfied of its efficacy.—Oct. 12, 1853.

From Mr. Atkins, Gardener to John Jenkyns, Esq., Botley Hill.

I used your Composition on young Peach and Nectarine trees, and found it of great service.—Jan. 5, 1854.

From Mr. A. Barnes, late Gardener to the Rev. Mr. Rashleigh, Hamble Rectory.

I highly approve of your Composition for destroying mealy bug and thrip on stove and greenhouse plants; for the bug I applied it three times before it was totally killed.—Jan. 1, 1854.

From Mr. G. Jones, late Gardener to Charles Seagrim, Esq., Southgate House.

Having used your Composition on Peach, Cherry, and Rose trees, greenhouse plants, Cucumbers and Melons, it speedily effected the desired purpose, without the least injury to the plants; it is the cheapest and best remedy ever offered to the public.—Jan. 11, 1854.

From Mr. S. Wraight, Gardener to J. Lake, Esq., Green Street, Sittingbourne.

It is with pleasure that I state your Composition has proved valuable to me, in the destruction of green-fly, red spider, &c., during the past season.—Jan. 12, 1854.

From Mr. Harris, Gr. to the Rev. E. Timson, Tatchbury Mount.

I have used your Composition most successfully upon Peach and Nectarine trees, and have seen it succeed equally well with my friends, and consider it is the remedy we must all have recourse to.—Jan. 18, 1854.

From Mr. Smithers, Gardener to Sir W. Milner, Bart., New Appleton, Tadcaster.

Your Blight Composition answered perfectly well.—Jan. 23, 1854.

From Mr. J. Daniels, Gardener to the Rev. C. E. Rush Keene, Swycombe House.

The Blight Composition I found most efficacious in the destruction of all kinds of insects, more particularly that troublesome pest the Cucumber thrip, which has hitherto resisted every means that have ever been recommended for its destruction. I find on being touched by the Composition it instantly dies, and I found it much more destructive to all the aphis family than tobacco water, without doing the least injury to the most tender plants.—Jan 24, 1854.

From Mr. Jno. Page, Gardener to A. Dixon, Esq., Birches Green.

I used your Composition upon Vines infested with mildew, which it instantly arrested; also on Cheries and Peaches, for the aphis and spider, with beneficial results; it also produces a fine, dark, healthy foliage wherever it is applied.—Jan. 31, 1854.

Your Composition will destroy mildew, as I have tried it several times.—Oct. 25, 1854.

From Mr. Jones, Gardener to J. M. Elwes, Esq., Bossington House.

My Vines were very much infested with scale and red spider, berries as well as leaves, and seeing the many testimonials by experienced men of the good effects produced by your Composition, I gave them two syringes all over, which effectually destroyed both pests. I think it the best remedy for green-fly, &c., that can be produced.—Feb. 28, 1854.

From the Hon. and Rev. F. Curzon, Vicarage, Mickleover.

It is the most efficacious remedy I have ever used.—July 11, 1854.

From the Rev. W. M. Frost, Tring Rectory.

I am indebted to your Composition for the preservation of a crop of Melons, which were attacked by the spider; but it soon disappeared, and the plants flourished vigorously. I intend using it again, as I know of nothing so effective.—Feb. 19, 1855.

FINEST MIXED PERMANENT PASTURE and LAWN GRASSES, not to be surpassed in the Trade, and it is with pleasure Her Majesty's beautiful Grounds at Osborne Palace, the Southampton Parks, &c., can be referred to.

AGENTS CAN NOW BE TREATED WITH.

Offices and Warehouses, 37 & 38, Oxford Street, (adjoining Radley's Hotel, one minute's walk from the Railway and Docks), and 58, Above Bar, Southampton.

NEW PLANTS.

A. VERSCHAFFELT, Nurseryman, Ghent, Belgium, begs to offer to Amateurs and to the trade his following new plants:—

ACHIMENES (TREVIRANIA), AMBROISE VERSCHAFFELT. This is the finest Achimenes of all; a correct drawing is figured in L'Illustration Horticole, Number 1, 1855. Nice plants will be sent out next May, each 8s.—N.B. One over if three plants are taken.

GESNERA WARSCEWICZII; magnificent plant for foliage, and particularly for the flowers. It is the finest gesneriaceous plant of all; a correct drawing is figured in L'Illustration Horticole, Number 1, 1855. Strong plants are now ready for sale, each 15s.—N.B. One over if two plants are taken.

RHODODENDRON (HARDY) PRINCE CAMILLE DE ROHAN. This is the finest hardy variety raised; a correct drawing is figured in L'Illustration Horticole, Number 2, 1855. This variety is warranted to be quite hardy, and very fine bloomer. Nice plants will be sent out next May, each 15s. N.B. One over if three plants are taken.

Agent in London: Mr. R. Silberrad, 5, Harp Lane, Great Tower Street.

DR. SYNTAX CUCUMBER.—The above celebrated variety has been nearly lost to gardeners for several years past. It is known by all experienced growers of Cucumbers to be the very best sort in existence for early work.

A paper sent free per post on receipt of 13 stamps.

NOW'S HORTICULTURAL BROCCOLI.—Half-ounce packets sent free per post on receipt of 24 stamps.

NORTHAMPTON MARKET BROCCOLI.—This variety is grown by the market gardeners here, and excites the admiration of all who see it. Visitors say "they never saw such Broccoli anywhere else." Half-ounce Packets sent free per post for 14 stamps.—John Jeyes, Nurseries, Northampton.

SUPERIOR EARLY BROCCOLI.

MITCHINSON'S PENZANCE OR EARLY WHITE CORNISH BROCCOLI.—*Celebrated and invaluable for its earliness, coming into use early in February, a full-sized handsome head of excellent quality, but a shy seeder,* 1s. 6d. *per packet, or* 12s. *per ounce.* New Seed can be had in sealed packets of the following Agents in London:—Nash, Minier, and Co., Strand; Dawe, Cottrell, and Benham, Moorgate Street; Hurst and McMullen, Leadenhall Street; Flanagan and Son, Mansion House Street; or from Mitchinson's Seed Establishment, Truro, Cornwall.—December 2.

From numerous unsolicited Testimonials we select the following:

To Messrs. Mitchinson and Co., Seed Merchants, Truro, Cornwall.

"Sirs, I have enclosed 18 postage stamps for a packet of your Penzance Broccoli Seed, the same kind as you sent me last year. I hope I am not too late, for I am anxious to procure it, if possible, for I can bear testimony to its value as a new, early, and a superior Broccoli, for I have been cutting upwards of 30 heads every week from the beginning of February.

"Dorking, Surrey, April 6, 1854. "W. Underwood."

To Messrs. Mitchinson and Son, Seedsmen, Truro, Cornwall.

"Sirs,—I enclose you 1s. 6d. worth of stamps, and hope you will send me a small packet of the Early Broccoli you advertised last year. I have beat all my neighbours this year with your Broccoli, which has been very fine and true, and stood the winter well. "George Pender."

"Sandgate, Kent, April 10, 1854."

To Mr. Mitchinson, Seedsman, Truro.

(Enclosed with Specimen).

"Sir,—I beg to forward you this Broccoli, one of the sort after your own name. I have had a splendid crop of them this season, many of which measured three feet in circumference, and quality excellent. Cut the first on the 11th of February. If seed is scarce, be kind enough to save two packets.—T. Bice Gardener, Grampound Cornwall. April 7 1854."

FIVE HUNDRED BUSHELS OF POTATOES TO THE ACRE.—This enormous crop was grown this year by a gentleman in Surrey, and out of which there were only 5 bushels diseased; nearly all the quantity were large sized, some weighing 2 lbs. and 1 oz., and not above 30 bushels of Chats out of the whole. This Potato was originally reared in Scotland, and is called by its grower the Scottish Champion. It is a good baker and boiler. Price 2*l.* 2*s.*, inclusive of the sack of 3 bushels, delivered free at the South Western Railway station in London. Early application is necessary, as only a few sacks are for sale, the party growing intending to plant largely next season. A reference as to the quantity and quality can be given in the neighbourhood—Apply by letter, post-paid, to B. S., 4, Crooked Lane, London Bridge, where samples may be seen, and the name of the grower given.

All orders must be accompanied by a remittance.

NOTICE IS HEREBY GIVEN, that the Partnership heretofore subsisting between us, the undersigned JOHN SCHOFIELD and CHARLES SCHOFIELD, carrying on business at Knostrop, in the Borough of Leeds, in the County of York, as Gardeners, Seedsmen, and Florists, under the style or firm of "J. Schofield & Son," was this day dissolved by mutual consent. All debts due to and owing by the said firm will be received and paid by the said Charles Schofield, by whom the business will in future be carried on.

Dated this 24th day of February, 1855,

John Schofield,
Charles Schofield.

Witness,
Wm. Clarke, Solicitor, Leeds.

CHARLES SCHOFIELD, in respectfully soliciting a continuance of the support so long accorded to the late Firm, begs to assure his Friends and the public that every exertion shall be used to merit their future patronage.

Knostrop, near Leeds, March 3.

PAGE AND CO.'S

COMPOSITION FOR THE DESTRUCTION OF BLIGHT

UPON

Roses, Wall-fruit Trees, Cucumbers, Melons, Vines, Stove and Greenhouse Plants.

Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra).
In Bottles, 1s. 3d. and 2s. 6d. each. Directions for use forwarded.
10 Gallons and Upwards CARRIAGE FREE TO LONDON.

AFTER FOUR YEARS' EXTENSIVE USE, by the most eminent Gardeners in the kingdom, the superiority of PAGE & Co.'s BLIGHT COMPOSITION is unquestionable, requiring only a trial to insure its general use for destroying every pest to which Plant and Fruit Growers are subject (without injuring the most delicate flowers or foliage) and promoting a luxuriant growth.

From Andrew Tweed, Esq., Royal Gardens, Osborne Palace.
I have great pleasure to add my testimony to the efficacy of your Blight Composition, which has been used with great success upon Rose trees much affected with the green fly.—Nov., 1852.

From Frederick Mallison, Esq., Royal Gardens, Claremont.
I find it answers the purpose in all respects for walls, also for green fly and brown scale in the houses. I have no occasion to try it in any other way as yet.—May 10, 1854.

From J. Barker, Esq., his Grace the Duke of Bedford, Woburn Abbey.
I have much pleasure in bearing testimony to the valuable qualities of Messrs. Page & Co.'s Composition, which I have found very efficacious in destroying the green fly (or aphides), on the young shoots of Peach trees, as well as those of the Rose, when liberally syringed with the mixture.—To Mr. Freeman, Woburn, of whom the Composition can be had.—Dec. 14, 1854.

From Mr. E. Butcher, Gardener to the Right Hon. Lord Jersey, Middleton Park.
I am much pleased with the Composition; it far exceeded my expectations.—March 31, 1854.

From Mr. S. Snow, Gardener to Earl de Grey, Wrest Park.
Please forward me another 10 gallon cask of your Blight Composition. I have found it answer the purpose exceedingly well.—Jan. 25, 1854.

From Mr. A. Pearson, Gardener to the Right Hon. Lord Henry Chelmondeley, M.P., Holly Hill.
Your Composition is most destructive to all blight. My wall trees must have died had I not availed myself of it. I consider it applicable to all cases, as it is not the least injurious to the foliage of the most tender plants.—May 17, 1851.

From Mr. W. Farthing, Gardener to the Right Hon. Lord Ashburton, The Grange Park.
I consider your Composition valuable for the destruction of insects of all kinds.—Nov. 3, 1852.

From Mr. F. Wace, Gardener to the Right Hon. Earl Grey, Howick Hall.
After giving your Blight Composition a fair and impartial trial, I am glad to bear testimony to its efficacy in destroying those worst of all pests the thrip and red spider; two parts water to one composition, but the green fly quickly disappears if double that quantity of water be used. I have not found it to injure the most delicate plants.—Sept. 14, 1852.

From Mr. Lucas, Gardener to the Right Hon. Lord Palmerston, Broadlands.
I have used your Composition according to your instructions, and consider it valuable for the destruction of insects, &c. I am confident it will be much used when gardeners give it a trial.—January 5, 1854.

From Mr. F. Dawson, Gardener to the Right Hon. Earl Cowper, Panshanger.
I used it upon Peach and Nectarine trees to destroy the green fly; also upon Morello Cherries for the black bug, and found it effectual in both cases.—August 3, 1854.

From Mr. White, Gardener to the Right Hon. Earl Rivers, Rushmore.
I very much approve of your Blight Composition; my Peach trees were much infested, but one application so completely removed them that the set-off of the wall was covered. It also destroyed the black beetle on my Cherries, and the thrip upon my Cucumbers, a pest that I could not before get rid of by fumigation or sulphur.—August 30, 1854.

From Mr. R. Porter, Gardener to the Right Hon. and Rev. Lord C. H. Hervey, Chesterford.
I found it most destructive, especially to kill green fly and also the black aphis upon my Cherries. I am certain if properly used, it will give every satisfaction.—December 1, 1854.

From Mr. J. Brown, Gardener to the Right Hon. Sidney Herbert, Wilton House.
This summer has been a very blighty one, indeed more so than I ever remember, but am pleased to say our wall trees were never so well, which is owing to the use of your Blight Composition.—July 26.

From Mr. George Tillyard, Gardener to the Right Hon. C. S. Lefevre, Heckfield.
Your Blight Composition has given me every satisfaction, and when better known will be extensively used.—July 31, 1854.

From Mr. Packman, Gardener to J. Gadesden, Esq., Ewell Castle.
As I found your Composition very useful last year, I should like to have 10 gallons sent immediately.—April 1.

From R. J. Sprenger, Esq., Southend House.
The Composition is very effectual.—April 13.

From the Rev. F. Glossop, West Dean Rectory.
I will thank you to send me some Blight Composition, which my gardener found to answer very well last year.—April 18.

From Mr. F. Thorne, Gardener to the Hon. F. Baring, Melchet Park.
I am glad to have found so useful a Composition.—April 21.

From Mr. C. Robinson, Gardener to E. B. Tunno, Esq., Warnford Park.
I have used your Composition for two years, and found it very efficacious.—May 8.

From Thomas Higgs, Esq., Stapleton Road, Bristol.
The Composition gave such satisfaction to myself and friend that we wish you to send us a small cask.—May 11.

From Mr. James Robeson, Gardener to E. Currie, Esq., Vale Lodge.
I am glad to say your Composition has destroyed every living thing in shape of thrip, scale, or green fly, with one washing, after everything else had failed; without a doubt, it is the best thing ever introduced!—May 18.

From Mr. Thomas Challis, Gardener to Sir F. Bathurst, Bart., Clarendon Park.
It kills the blight dead, wherever it touches.—May 20, 1854.

From Charles Lane, Esq., Budgemore.
The effect of the Composition upon the trees and plants under the dreadful blight we have had remains the same, and it is surprising to see the healthy state to which it soon recovers them.—May 23, 1854.

From Mr. H. Robertson, Gardener to Sir M. G. Chelmely, Bart., Easton Hall.
I find it an excellent Composition; it entirely destroyed the black fly upon my Cherries. Please send me double the quantity.—June 2, 1854.

From Mr. F. Hamlett, Gardener to Miss M. Phillips, Lisle Villa.
I am much pleased with your Composition; the trials I have made have proved very satisfactory. I shall soon give you a larger order.—June 9, 1854.

From Mr. John McDonald, Gardener to the Rev. Thomas Hubbard, Sennicotts.
With three-quarters water your Composition was most effectual in destroying the black and green fly upon my wall trees. Please send two gallons more.—June 15, 1854.

From Mr. J. Steptoe, Gardener to Colonel Onslow, Upton House.
It surpasses everything I have ever tried. Please send another jar.—June 22, 1854.

From Miss Parry, Westbury House.
Miss Parry begs to inform Messrs. Page & Co. that her gardener has used the Composition with the greatest success upon Roses and Geraniums, and she has strongly recommended it to her friends.—July 5, 1854.

From Mr. J. Teal, Cambridge House Gardens.
I have used your Composition on walls, also on Melons and Cucumbers, and find it everything I could expect: it produces an instant effect, and in no way injures the plants.—July 11, 1854.

From Mr. R. Taylor, Gardener to C. Paget, Esq., Ruddington Grange.
It destroys all insects it comes in contact with.—July 14, 1854.

From Mr. G. Beagenie, Gardener to — Williams, Esq., Tring Park, Herts.
I have used your Composition upon wall trees, on Strawberries (when the fruit was nearly ripe), on Melons and Cucumbers covered with thrip and red spider, and on stove plants for mealy bug; and in no instance have I found it to fail. Before I had it I used from 1 lb. to 3 lbs. of tobacco per week: now I do not require 2 oz. It is efficacious and economical; every gardener should keep it by him.—July 14, 1854.

From Mr. W. Shakespear, Metallic Hot-house Manufactory, Birmingham.
It is thoroughly destructive to insects without injuring the foliage of the plants.—July 26, 1854.

From Mr. G. Lambert, Gardener to G. Baring, Esq., Oakwood.
I have found your Blight Composition to be good for the destruction of green fly, &c.—July 26, 1854.

From Mr. H. Dawes, Gardener to J. A. Sewell, Esq., Marelands.
It is truly the best remedy for green fly I have ever met with. It deals destruction to all the aphis tribe on the very first application.—July 26, 1854.

From Mrs. Gundry, Hyde.
The Blight Composition Mrs. Gundry found highly beneficial.—July 26, 1854.

From Mr. Jones, Gardener to R. D. Shafto, Esq., Hampworth Lodge.
I have found your Composition of great benefit to my fruit trees, as it quite destroyed the blight.—July 27, 1854.

From Mr. G. Olarenshaw, Gardener to G. Monckton, Esq., Somerford Hall.
I can highly recommend your Composition as the best remedy for the destruction of blight. In April my Peach and Nectarine trees were in a horrid state; I gave them one good washing and they have looked beautiful ever since. Some Melons, completely eaten up by thrip (thought beyond all recovery), it quite recovered, and I have some fine fruit.—July 27, 1854.

From Mr. W. Campbell, Gardener to W. C. Harland, Esq., Sutton Hall.
I find it a complete cure for every pest plants and fruit trees are alike subject to.—July 27, 1854.

From Mr. W. Underwood, Gardener to J. Labouchere, Esq., Stoke Park.
I am quite satisfied as its merits become known it will be considered the most excellent effectual remedy ever introduced, and highly appreciated by all gardeners; my Roses were nearly dead, but have since made clean healthy shoots.—July 27, 1854.

From Mr. W. Shephard, Gardener to A. Currie, Esq., High Elms.
My Peach trees were covered with black fly, which quickly disappeared. My Roses remain clean and healthy, and it is an effectual remedy.—July 27, 1854.

From Mrs. Fenwick, Field Green.
I found it destroy the blight completely.

From Thomas Hoskins, Esq., Haselbury.
I have much pleasure in bearing testimony to the efficacy of your Blight Composition, which I have used with perfect success.—July 27, 1854.

From Mr. T. Oliver, Gardener to Sir J. R. Reed, Bart., Ewell Grove.
I have used your Composition with Cucumbers, Melons, Pot Plants, and Wall Trees with perfect success in every instance, and consider it a most effectual remedy.—July 28, 1854.

From Mr. George Clayton, Gardener to J. W. Childers, Esq., Cantley Hall.
It has proved to be the best Composition I have ever applied to Plants for the destruction of blight.—July 31, 1854.

From Mr. J. Gregory, Gardener to Mrs. Singleton, Hazeley House.
I highly approve of your Blight Composition, having used it upon wall trees and Roses, and found it a valuable remedy.—Aug. 5, 1854.

From Mr. Jones, Gardener to R. D. Shafto, Esq., Hampworth Lodge.
I used your Composition upon Roses, Cherries, Peaches, Nectarines, &c., and found it excellent.—Aug. 21, 1854.

From Mr. Doswell, Gardener to Sir John Barker Mill, Bart., Mottisfont.
I have given your Blight Composition a fair trial, and am pleased to say that it has killed the green fly, red spider, mealy bug, and thrip in every instance.—Sept. 2, 1854.

From Mr. A. Campbell, Gardener to John Shelley, Esq., Avington Park.
I beg to recommend your Composition for killing insects of all kinds. I have used it on the Peach and Nectarine, and found it to be most valuable for all my plants.—Sept. 19, 1854.

From Mr. Martin, Gardener to Sir P. Hartdyke, Lullingstone Castle.
Your Blight Composition I find superior to anything I have used before; the first dressing, I believe, killed every insect. The Peaches and Nectarines, which were much infested, have since looked better than I ever saw them.—Oct. 5, 1854.

From Mr. Warren, Gardener to W. Pinney, Esq., Somerton.
I have used Composition upon Cucumbers, Melons, Roses, Pot Plants, and Wall Trees with perfect success; nor is it the least injurious to the foliage of the most tender plants.—Oct. 7, 1854.

From W. H. F. Cavendish, Esq., Agot, St. Lawrence.
I think your Wash for Blight the best thing I have seen. I am a great Rose grower, and in this bad season of blight I have not a Rose that has done badly, or even shown any sign of blight; it also helped me much with Fruit Trees, but the blight was too strong before I got any of it from you."—Oct. 6.

From Mr. W. Poole, Packington Hall Gardens.
I have given your Blight Composition a fair trial upon Peach and Nectarine Trees, and gladly bear testimony to its efficacy in destroying all insects without the least injury to the foliage.—Oct. 19, 1854.

From Mr. E. Cleeton, Gardener to Edward Holland, Esq., Dumbleton House.
I found your Composition kill thrip, red spider, green fly and mealy bug upon stove and greenhouse plants, Roses, Melons, Cucumbers, and everything it was tried upon; therefore please send me a further supply.—Nov. 22, 1854.

From Mr. John Cox, Gardener, Redleaf.
My opinion as to the merits of your Blight Composition is in the highest degree favourable. Last season my Cucumbers and Melons became infested with a peculiar kind of aphis, which was so tenacious of life that the fumigation requisite to kill it killed also the plants. I destroyed several frames, and left one large one of Cucumbers solely to try the effects of your Composition. I did so, and the effect, to my thinking, was little short of miraculous. The plants recovered immediately, and commenced growing again with the greatest vigour.—Nov. 28, 1854.

From Mr. John Perkins, Market Square, Northampton.
The Composition I am quite satisfied with, and shall require more.—October 3, 1854.

From Mr. G. Winzer, Gardener to Mrs. Pattison, Wrackleford House.
I have tried it for mealy bug and white scale, and found it effectual in destroying both pests.—December 6, 1854.

From Mr. John Jobson, Gardener to J. W. Scott, Esq., Rotherfield Park.
I shall not be without your Composition again.—Dec. 6, 1854.

From Mr. Reith, Gardener to C. E. Rumbold, Esq., Preston, Candover.
My Peach trees were much infested with green fly. I only used the Composition twice, and was perfectly satisfied with the result; the trees were very healthy all the season afterwards.—December 7, 1854.

From Mr. W. Buckland, Gardener to W. Smith, Esq., Little Houghton.
I much approve of Page & Co.'s Composition, as it does execution quickly; I shall be glad to have more of it.—Dec. 15, 1854. (To Mr. Freeman, Woburn.)

From Mr. G. Mackie, Gardener to E. Bouverie, Esq., Delapre Abbey.
I can certify with pleasure to its efficacy in destroying green fly, I also found two dressings of it destroy the mealy bug without injury to the plants.—Dec. 15, 2854. (To Mr. Freeman, Woburn).

From Mr. Thomas Bell, Gardener to E. L. Rudge, Esq., Abbey Manor, Evesham.
I quite approve of your Blight Composition.—Jan. 2, 1855.

From Mr. John Hunt, Market Gardener, Southampton.
I have used your Composition upon wall trees which I considered quite worthless, but which after two applications made a vigorous growth and have ripened some good wood.—January 2, 1855.

From W. Stride, Esq., Redbridge.
I have found it completely effective, when mixed with an equal part of water, in destroying at a single application every kind of enemy which attacks the Peach, the fly on the Rose, and better than all, so far as I am individually concerned, a black and small shiny beetle which appears on the tender shoots of young Cherries about Midsummer, and which on espaliers I never could annihilate till last summer, when one application effectually removed the whole community and enabled the trees to make satisfactory progress to the end of the season.—Nov. 5, 1852.

From Mr. J. Dummer, Gardener to the Very Rev. The Dean of Winchester, Bishopstoke.
I have used your Composition upon Cucumbers, Melons, Roses, pot plants, and wall trees, with perfect success in every instance, and consider it the most safe, speedy, and effectual remedy ever introduced.—Oct. 22, 1852.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—NOTICE is hereby given that an Election of Ten Pensioners on the Funds of this Charity will take place in June next. All persons desirous of becoming Candidates are requested to send in their certificates and testimonials to the Committee on or before the 31st inst., after which time they will not be received. Forms of petition may be had on application to

March 10. EDWARD ROGER CUTLER, Sec., 14, Tavistock Row, Covent Garden.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

CUTHILL'S BLACK SPINE CUCUMBER, the best for all uses, 1*s*. per packet; SNOW'S WHITE SPINE, 1*s*. per packet.

CUTHILL'S PAMPHLET on the POTATO, with 20 more Articles on Fruits and Vegetables. Third Edition, 2*s*.; or by post, 2*s*. 4*d*. CUTHILL'S Second Edition of MARKET GARDENING, 1*s*. 6*d*.; by post, 1*s*. 8*d*.—JAMES CUTHILL, Camberwell, London.

BROCCOLI IN SUCCESSION.—The importance of sowing at the proper season the proper sorts to succeed each other, has induced Messrs. SUTTON to furnish some instructions in this matter in their SEED AND PLANT LIST, which also contains many other useful hints on Horticulture and Agriculture. This publication may be obtained post free in return for postage, receipt, or draft stamps.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

THOMAS PERKINS has still on hand strong VINES from Eyes, 4 to 6 feet rods, namely:—Black Hamburgh, Black Prince, Black Frontignac, White do., Grizzly Frontignac, White Muscat, Chasselas Musque, West's St. Peter's, and Muscat of Alexandria.

In consequence of T. P. leaving the land by the 25th inst., the above will be sold at very low prices on application to the Nurseries, Atherstone, Warwickshire.

STRAWBERRY PLANTS.

WILLIAM NICHOLSON is now sending out fine strong plants of his four New and excellent varieties, viz., AJAX, the finest dessert fruit; RUBY, do.; CAPTAIN HOOD, dessert and market; FILLBASKET, do., tremendous cropper, at 8s. per 100. The plants have been kept in frames under glass, and are in good condition for planting. Post-office orders payable at Yarm, Yorkshire, which are in all cases required with the order.—Egglescliffe, near Yarm, Yorkshire.

T. F. WINSTANLEY'S Descriptive Catalogue of GARDEN and FLOWER SEEDS is now ready, and can be had on application, or sent free by post.

28, Market Place, Manchester.

T. F. WINSTANLEY'S Descriptive AGRICULTURAL SEED LIST will shortly be ready, and may be had on application, or sent free by post. The above List contains much useful information.—28, Market Place, Manchester.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

VERBENAS AND PANSIES.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to offer in good bedding varieties, strong stock Verbenas in 4-inch pots, at 4*s*. per dozen; 24 varieties of good Pansies, at 4*s*. per dozen; 40 seeds of a good useful Cucumber, sent for 12 postage stamps; and Polyanthus from named varieties, 1*s*. per dozen.

BRITISH QUEEN STRAWBERRIES.—Plants for Forcing, autumn raised, in 32 pots, at 2*l*. per hundred.—Mr. MANN, Market Gardener, Mogden Lane, Isleworth.

R. SMITH is now sending out his New Seedling Strawberry, SIR CHARLES NAPIER, the best forcing one of the day, admired by all who have seen its growth, and for colour not one to equal it. Price 3*l*. per 100; 50 for 30*s*.; 25 for 1*l*. Also, Sir Charles Napier, British Queen, and Keen's Seedling in pots for Forcing.—R. SMITH, Market Gardener, Richmond Road, Twickenham.

NOTICE.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, beg to intimate to those who have transmitted orders for PLANTS, that they have made arrangements which will enable them to execute the same with the least possible delay after the breaking up of the protracted frost. As their grounds are for the most part dry and well drained, they are happy to say that their Nursery Stock has escaped material damage.—March 10.

CHEAP NURSERY STOCK.

IMPORTANT TO ALL PLANTERS WHO DESIRE IMMEDIATE EFFECT.

WILLIAM JACKSON & Co., Bedale, Yorkshire, beg to refer to their advertisement in the *Gardeners' Chronicle and Agricultural Gazette* of the 17th February, page 110.

ROGERS' AGRICULTURAL, CULINARY, AND FLOWER SEED DEPOT; REGISTRY OFFICE FOR GARDENERS, &c.—Clock House, Chelsea.

EMPRESS OF THE FRENCH CUCUMBER, and all the new things supplied. See CATALOGUE.

SEED POTATO, ETC.

THE BRITISH QUEEN, for productiveness, earliness, and quality unequalled:—First size, 7*s*. per bushel; second size, suitable for planting whole, 5*s*. per bushel, carriage paid to London. Also, a very superior Bath Cos Lettuce, in 1*s*. packets, free by post.—HART & NICKLIN, Florists and Seedsmen, Guildford.

SEED POTATOES.

C. FLITTON begs to call the attention of growers to his choice stock of SEEDS, which he can with confidence recommend, viz., Early Shaws, York Regents, York Reds, and Jersey Blues. Can be had in bags from 1 cwt. at 8*s*., or 15*s*. 6*d*. 2 cwt.; Fluke Kidneys, 9*s*. 6*d*. per 112 lbs., for cash.—Address C. FLITTON, Potato Factor, 21, York Road, King's Cross, London.

NEW CHINESE POTATO—
DIOSCOREA (JAPONICA) BATATAS.

T. F. WINSTANLEY has received a limited quantity of the above new Potato. For description and method of planting see his Garden Seed List, where full particulars are given. T. F. W. has also a few Plants left of the Kaisha or Sweet-kernelled Apricot, a fortnight earlier than the Moor Park. Prices on application.—28, Market Place, Manchester.

FLUKE KIDNEY POTATO.

T. F. WINSTANLEY has a very fine stock of the above unrivalled POTATO, selected small for SEED, as they do not bear cutting. Also Lapstone Kidney, Ashleaf, Flourball, and many other varieties. Prices on application. The Trade supplied.—28, Market Place, Manchester.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren; very large and firm heads. Price to the trade 24*s*. per lb., smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

DWARF FRENCH BEANS can be had in any quantity.—Apply to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

SANGSTER'S EARLY No. 1 PEA.—To save trouble HAY, SANGSTER, & Co. beg to say they are now out of the above for this season, except in retail at 1*s*. 6*d*. per quart. (Not to be repeated.)—Newington Butts. March 10.

TO BE SOLD, 20 to 30 thousand LARCH, from 4 to 5 feet. Delivered free on board at Leith, or to the railway station, at 21*s*. per thousand.—Apply to Mr. HENRY CLARKE, 39, King Street, Covent Garden, London.

TO BE SOLD, very cheap, 20,000 Transplanted NORWAY SPRUCE, 2 to 2½ feet. Price on application.—SAMUEL FINNEY & Co., Gateshead Nursery, Newcastle-on-Tyne.

TO BE SOLD, a private collection of ORCHIDACEOUS PLANTS, choice species, the property of gentleman declining their cultivation.—Apply to Mr. KENNEDY, Bedford Conservatory, Covent Garden.

R. KENNEDY'S CATALOGUE of BRITISH and FOREIGN FERNS may be had on the receipt of six postage stamps.

TO BE SOLD, a first-rate Collection of ORCHIDS and other Stove and Greenhouse Plants, the property of a gentleman declining their cultivation.—For particulars apply to GARAWAY, MAYES, & Co., Durdham Down Nurseries, Bristol.

THE TRUE PERENNIAL RED CLOVER (TRIFOLIUM PRATENSE PERENNE), may be obtained from Messrs. SUTTON & SONS, Reading, at 9*d*. to 1*s*. per lb., according to sample and quantity required.

GERMAN FLOWER SEEDS FRESH IMPORTED.

SUTTON AND SONS *have imported a superior assortment of New German Flower Seeds, a Priced List of which may be had post free.*

SUTTON'S IMPROVED ITALIAN RYE-GRASS, AND DICKENSON'S ITALIAN RYE-GRASS, are both very superior to the Italian Rye-grass commonly cultivated.

At present Messrs. SUTTON *have a supply of true Seed of each sort, price 7s. 6d. per bushel.*

MANGOLD WURZEL SEED.

PURCHASERS OF LARGE QUANTITIES will be treated liberally.—For prices apply (stating the quantity required) to SUTTON & SONS, Seed Growers, Reading.

MANGOLD WURZEL SEED, LONG RED, and YELLOW GLOBE, warranted genuine, and the growth of 1854. Price 45*l*. per ton.—Apply to R. S. HEWS, Kelvedon, Essex.

ASPARAGUS PLANTS.—Best Quality, about 20,000, at the Nursery of JOHN WEEKS & Co., King's Road, Chelsea.

LIQUIDAMBAR.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

IPOMŒA RUBRO CÆRULEA.—Seed of this exceedingly beautiful Climbing Annual being now obtainable at a moderate price, all cultivators of flowers having a greenhouse or wall with warm aspect are advised to include it in their spring selection.—Seed supplied to Seedsmen and Nurserymen only, by GEORGE ROBERTS, 32, Moorgate Street, London.

WANTED TO PURCHASE, a quantity of FRUIT TREE STOCKS and MAIDEN TREES.—Address, stating sorts and price, JAMES LAKE, Nurseryman, Bridgewater.

TIMBER.

WANTED, Old WALNUT TREES, SYCAMORE, CHESNUT, LIME TREES, &c. Send size and price, by letter, to Mr. E., 41, Fellows Street South, Pearson Street, Kingsland Road, London. Copy the address.

ENGLISH OAKS.

WANTED IMMEDIATELY, a considerable quantity of FINE TRANSPLANTED ENGLISH OAKS, from 4 to 6 feet high; STIFF, STRAIGHT, and WELL-ROOTED.

Any Party having such to offer may hear of a purchaser by addressing A. B. C., Office of this Paper.

WM. WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, will be happy to forward prices of a large quantity of very fine One-year Seedling LARCH, on application.

FOWLER AND WRIGHT, SEEDSMEN and NURSERYMEN, Glasgow, have for sale 1 year Seedling LARCH, 2 year Seedling LARCH, 1 year Seedling BEECH, and 1 year Seedling ALDER. Price forwarded on application.—March 10.

FRUIT TREES, FOREST TREES, AND SHRUBS, GARDEN AND FLOWER SEEDS, PERMANENT PASTURE GRASSES, and FINE DWARF LAWN GRASSES.—Catalogues of the above may be had on application to WILLIAM BARRATT, Saint John's Nursery, Wakefield.

TO PLANTERS.

HAY, SANGSTER, AND CO., have for sale the following;—600 to 700 strong Standard PEARS, 500 Dwarf do., and 100 Dwarf-trained do. Any reasonable offer will not be refused, as the ground must be cleared by the 25th March.

Apply to HAY, SANGSTER, & Co., Newington Butts, London; of whom also may be had for seed York Regent Potatoes, 6*s*. and Early American, 8*s*. per bushel of 56 lbs., the produce of their prepared Cuttings. Terms cash.

R. PARKER begs to offer the following, all of which are well established, and can be forwarded to any part of the Kingdom:—

	Per dozen.—s.	d.

Superlative Improved	Green Gage
Walker's Rambler	Persian Green Flesh
Manchester Prize	Chichester Prize
Hunter's Paradise	Cuthill's Scarlet Flesh
Improved Patrick.	Victory of Bath.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Holloway.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out April 10, 1855, the following new Seedling FUCHSIAS, raised by Messrs. Story and Banks.

Queen Victoria (Story's), scarlet, with white corolla. 10s. 6d.
Prince Albert (Banks's), fine violet corolla. 10s. 6d.
Ferrugina (Story's), fine striped corolla. 10s. 6d.
Empress Eugenie (Story's), rosy crimson, white corolla. 10s. 6d.
Ranunculiflora (Story's), fine double white corolla. 21s.
Lady of the Lake (Story's), blush, white corolla. 10s. 6d.
Water Nymph (Story's) globe-flowered, fine white corolla. 10s. 6d.
Rathalie (Story's), beautiful variegated corolla. 10s. 6d.
Mrs. Story (Story's), fine white corolla. (In accordance with Mr. Story's wish this was named after Mrs. Story, as it was in his opinion the finest.) 10s. 6d.

Or if the set of Nine are taken, the price 4l. 4s., including SNOWDROP (Story's). This was received from Mr. Story as possessing a double white corolla, and described by himself and others who saw it in flower as a very beautiful variety. It was the first double white raised by him; but the plant did not flower in the Wellington Nursery after it was received by Messrs. Henderson, and through three stout branches having been broken off it, it did not quite correspond with the description given by Mr. Story and others a few months after to Mr. A. Henderson when at Newton making inquiries respecting the Plants. Consequently no charge will be made for it, but one will be presented with every set ordered.

FUCHSIA, BANKS'S FAVOURITE (BANKS), considered the finest of the blue violet corollas. 10s. 6d.

For further particulars see page 62 of the *Gardeners' Chronicle* for Jan. 27; or a list will be sent post free on application.

Messrs. E. G. HENDERSON & SON having purchased of the late W. Story, Esq., of Newton, in the county of Devon, for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, which new feature in this tribe he succeeded in introducing, and in consequence of an advertisement which appeared in the *Gardeners' Chronicle* some few weeks back from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, and after a written communication with that gentleman, it was thought necessary for one of the firm to make further inquiries about them, and in consequence Mr. Andrew Henderson went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of a great number of their customers throughout the autumn having ordered plants of them at higher prices than are above quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to the above.

Messrs. E. G. HENDERSON & SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their patrons and the public that their New Catalogue of Seeds for 1855 is now ready, with full descriptions and other information, and will be forwarded post free on application.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

Per packet—	s.	d.	Per packet—	s.	d.

Dioscorea Batatas (Japanese Yam), 2s. 6d. each tuber.
20 Ornamental Grasses (see Catalogue).
12 Ornamental foliage Annuals.—March, 1855.

MESSRS. WILLIAM ROLLISSON AND SONS beg to inform their Patrons and the Public that their NEW CATALOGUE OF SEEDS for 1855 is now ready, and will be forwarded post free on application.

W. R. & Sons embrace this medium of stating that many of the Seeds most difficult to obtain true, such as Beet, Lettuce, the Brassica tribe, &c., &c., are of their own saving, and the others have been procured from growers of the highest reputation; particular attention having been paid to secure the German Flower Seeds from eminent sources; are therefore able to state with confidence that the whole of their seeds are of very superior quality. W. R. & Sons respectfully invite attention to the following Choice Flower Seeds, selected from their Catalogue:—

	s.	d.
Alonsoa Warscewiczi, a beautiful half hardy annual, of graceful habit, with spikes of scarlet flowers	2	6
Arctotis breviscapa, a free flowering showy annual from the Cape	1	0
Aster, new Pæony pyramidal, in collections of 12 distinct colours	3	6

Messrs. W. Rollisson & Sons are desirous of directing especial attention to their fine Collection of Fruits, which contains all the choicest varieties in cultivation. The rare Cymbidium eburneum is now in blossom and can be seen at the

Nursery, Tooting, London.—March 10.

SUPERIOR GERMAN SEEDS WARRANTED.

JOHN WEEKS AND CO., King's Road, Chelsea, London, beg most respectfully to call the attention of their patrons to their very superior collection of German Seeds, Asters, Stocks, &c., which, having been grown, ripened, and selected under their own immediate care at their Branch Establishment in Germany, they can guarantee to be of the finest sorts and best quality. In order that ladies and gentlemen not possessing them from Messrs. Weeks this season may be enabled to judge of the rare beauty of the different sorts in their splendid collection, they will be grown at Messrs. Weeks' Horticultural Establishment, King's Road, Chelsea, where their patrons may make a personal selection for a future season.

For the general List of all other Seeds, see J. W. & Co.'s Seed Catalogue, and also their various Catalogues of Stove and Greenhouse Plants, Vines, &c. Also their Illustrated Catalogues on Horticultural Buildings and Heating by Hot Water.

CONQUEROR OF THE WEST CUCUMBER, 1s. per packet, containing 12 good seeds.

The above can be had, warranted genuine, by forwarding stamps for the amount to

James Lake, Seedsman, &c., Bridgewater.

"THE CATALOGUE OF SEEDS sold by J. WHEELER AND SON, of Gloucester, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a diversity of opinion as to the relative qualities of the various sorts; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short, select Seed List, to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. Wheeler's little book will do something to satisfy their expectations."—Gardeners' Chronicle.

J. C. Wheeler & Son will forward a copy of their Catalogue post free on receipt of two postage stamps. They can most confidently recommend the following collections of Garden Seeds, as comprising the most select sorts, and such that they feel sure will give entire satisfaction.

No. 1. A complete Collection, suitable for a large Garden ... 21s.
No. 2. A Collection of equally choice varieties, but smaller quantities ... ... 12s.
No. 3. A Collection suitable for a small Garden ... ... 7s.

These Collections will be sent Carriage Free to any Railway Station within 200 miles of Gloucester.

J. C. WHEELER AND SON, Seed Growers, Gloucester.

FIRST-RATE NEW FUCHSIAS, VERBENAS, CINERARIAS, GERANIUMS, PANSIES, ETC.

WM. RUMLEY AND SONS are now sending out the under-named in fine healthy plants, hamper included, or free by post, at the prices affixed, viz.:—

FUCHSIAS.—The following best new varieties of 1854, strong plants, 10s. 6d. per dozen, or six for 6s; or smaller plants, 6s. per dozen, or six for 5s.:—Admiral, Clio, Duke of Wellington, Elegans, Grandissima, Globosa Splendens, Henry Monteith, J. C. Palmer, Miss Hawtrey, Macbeth, Madame Auberge, Perfection (Standish's), Queen of Hanover, Thorntoni Perfecta, Vanguard, &c.

VERBENAS.—The following best new varieties of 1854, 9s. per dozen, viz.:—Arethusa, Angelina, Ajax (Mockett's), Ajax (Smith's), Annette, Captivation, Cardinal Wiseman, Francis Rousseau, Hector, Madame Schmidt, Mrs. F. G. Caley, Nancy, Superb, Queen, Rouge et Noir, Triumph, &c.

CINERARIAS.—The following best new varieties of 1854, strong plants, 12s. per dozen, or six for 7s.; or smaller plants, 9s. per dozen, or six for 5s., viz.:—Advancer, Empress Eugenie, Estelle, Etoile de Kaise, Garland, John Bull, Lord Stanley, Lablache, Lady Camoys, National, Nimrod, Novelty, Oriental, Polyanthiflora, Scottish Chieftain, &c. Good show varieties, 6s. per dozen.

GERANIUMS.—Extra fine, 9s. to 42s. per dozen; choice show do., 9s. to 30s. per dozen.

PANSIES.—Extra fine, 4s. to 6s. per dozen.

CARNATIONS and PICOTEES.—First-rate varieties, 15s. to 20s. per dozen pairs.

The above will be forwarded immediately to any part on receipt of a post-office order, payable at Richmond, Yorkshire.

A New Descriptive Spring Catalogue of the above, containing choice collections of Dahlias, Petunias, Antirrhinums, Hollyhocks, Chrysanthemums, Stove, Greenhouse, Bedding, and Hardy Plants, is now ready, and may be had on application.

Gilling, Richmond. Yorkshire.

"FASTOLFF RASPBERRY."—It is with much satisfaction that we announce a third award made by the London Horticultural Society, for examples of the above excellent Raspberry, unequalled by any other variety for size of its fruit and richness of flavour. It is reported in the *Gardeners' Chronicle*, as follows:—"Messrs. Youell, of Great Yarmouth, sent a boxful of beautiful fruit of the Fastolff Raspberry; they were unusually fine, and well deserved the certificate of merit awarded them."

Strong well-rooted Canes, 15s. per 100; Large White Raspberry, 24s. per 100; New Monthly Fruiting, 24s. per 100.

CHOICE FRUITS. (Warranted true to name.)

Orders of 2l. and upwards are delivered Carriage Free in London or Hull, or to any Railway Station within 20 miles of the Nursery.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

LATE WHITE SUPERB BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs. Elletsons, the raiser of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use with it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands some weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a fine Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for seed of the Pure Mammoth Broccoli, they determined to allow a flat price for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. Noble, Cooper, & Bowman, 6, Leadenhall Street; and Messrs. Hurst & M'Mullen, 6, Leadenhall Street; and of the Advertiser, 57, Queen Street, Cheapside, London.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds we sell are our own growing, and are proved before sending out, we especially succeed in giving entire satisfaction to our customers.

We solicit a trial, feeling assured of the receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

NEW BEDDING CALCEOLARIAS.

MESSRS. WILLIAM ROLLISSON AND SONS beg to announce that they have purchased the entire stock from Mr Cole of the undermentioned Gems, and will commence sending them out the first week in May.

CALCEOLARIA VARIABILIS, 10*s.* 6*d.* each.—As a bedding plant this will make a charming variety, and in some measure supply the deficiency there has been for durable and effective varieties of a light colour for the parterre. It is an excellent grower of very compact, pretty habit, and produces in great profusion immense trusses of blossom, which open of a delicate primrose colour, and change to white. Altogether it is a most desirable acquisition, and a variety thoroughly distinct to any in cultivation.

CALCEOLARIA ECLIPSE. 10*s.* 6*d.* each.—This is the most showy and brilliant coloured variety ever raised, of nice compact habit, producing large trusses of glowing crimson flowers, which are somewhat remarkable for the length of time they last in bloom; as a bedding plant its value will be inestimable. It was awarded a first class certificate by the National Floricultural Society, June 15, 1854, also at the Royal Botanic Gardens, July 5, 1854, and has been repeatedly noticed in the *Gardeners' Chronicle* for its good qualities and matchless colour.

The above two Calceolarias produce such magnificent trusses of blossom, and are so extremely effective, that they will be admirably adapted for Greenhouse and Conservatory decoration.

Messrs. W. R. & Sons have an excellent stock of Rollisson's Unique Geranium, which can be supplied at 5*l.* per 100. Although not new, this is a very useful and showy plant for bedding and general decorative purposes.

Messrs. William Rollisson & Sons beg to draw attention to their extensive Collection of Specimen and Half-specimen Orchids, Ericas, Azaleas, Stove and Greenhouse Plants, &c.&c., which are this season in unusually fine condition.

The Nurseries, Tooting, near London.

MESSRS. E. G. HENDERSON AND SON beg to draw especial attention to the following SHRUBBY BEDDING CALCEOLARIAS, which they can recommend as possessing first-rate properties and unsurpassed by any in cultivation.

The Calceolaria, as a bedding plant, stands pre-eminently high, and for a brilliant effect is unequalled by any in the parterre. The following new varieties, now for the first time offered for sale, possess a free, robust, and bushy habit, with a healthy vigorous growth; they can also with confidence be recommended for pot culture, as the length of time the flowers continue in perfection, and their large compact trusses, render them one of the most attractive flowers in the conservatory, even when placed beside the beautiful spotted and blotched Herbaceous Calceolarias.

Messrs. E. G. H. & Son having noticed many flowers of this class very beautiful, with colours and habits unexceptionable, when cultivated in pots and protected with glass, but when the same plants were planted in the open garden, they have proved anything but what was expected, and totally failed as bedding plants, either from the colours fading, or the growth and habit becoming stunted and changed so much that the abundance and continuance of flowering natural to this class was entirely wanting; consequently they determined that all their immense batch of Seedlings should be planted out in the open garden, where they flowered the whole of the summer, and as every other named variety in cultivation, both old and new, were also planted out beside them, a sure proof was thus obtained of the superior qualities of those now offered, and the best adapted for the purpose as compared with all known varieties.

To be sent out in May:—

	s.	*d.*
BRUNETTIA—Bright rich crimson, with extra large fine formed flowers, a most profuse flowerer, with a fine bushy habit, extra	7	6
CORREGGIO—Orange buff, shaded, free, large, and very showy, a first-rate bedding variety	7	6
MAGGIORE—Rich ruby crimson, with a large yellow cap, possessing a fine free growth, a noble bedding variety	7	6
MINNIE—Rich bright dark crimson flowers, a beautiful neat bedding variety, and remarkable free flowering, extra	7	6
NORMA—Crimson orange, very conspicuous, and one of the largest flowers of this class, free, vigorous, and noble growth	7	6
RED ROVER—Bright crimson shaded with orange, large, and free bloomer, fine habit	7	6
VEZZOSA—Flowers large and fine formed, of a bright orange and crimson shaded, with large trusses, flowering abundantly, and a splendid habit, extra	7	6
WILDFIRE—Bright dazzling orange and crimson shaded, large and very showy, fine free growth, extra	7	6

The Set of Eight Varieties, 2*l.* 2*s.*—March 10.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high: as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 7 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" Pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet: a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the Plants here offered may be seen growing in our Nursery: they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Cedars, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

ROSES! ROSES! A SUPERB AND VIGOROUS STOCK.

Dioscorea Batatas, 2*s.* 6*d.*; or five sets for 10*s.* 6*d.*

THOMAS JACKSON AND SON, Kingston-on-Thames.

TO THE TRADE.

MESSRS. YOUELL AND CO. would call the attention of Nurserymen to the fact that they still hold a large number of flowering HEATHS and EPACRISES in 48's, whilst in small and large 60's they also possess a large stock of well grown healthy plants, many of the Heaths and most of the Epacrises well set for flower. They would particularly recommend this size to parties purchasing largely and living at a distance, as owing to the size of the pots the expense of carriage would be but trifling. The Heaths, though by no means pot-bound, would require a shift immediately on their arrival; while the Epacrises, cut down after flowering, would make extra fine plants by next autumn. Terms liberal when taken in quantity.

Of ERICAS in 48's, well set for flower, we abound in Ventricosa superba extra, V. breviflora, V. tenuiflora, V. hirsuta, V. tumida, V. coruscans, V. densa carnea, V. fasciculata rosea, V. fasciculata supertia; Cavendishi, Metulæflora bicolor, Pyriformis, denticulata, moschata, rubens Lindelyana, hyemalis, fascicularis, &c. List and prices on application.

Royal Nursery, Great Yarmouth.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Great improvement may be effected by sowing 8 to 12 lbs. per acre of SUTTON'S Renovating Seeds, which consist of Perennial Clovers and Grasses of the finer kinds for improving the bottom.

An increase of several Tons of Hay per acre has been thus effected on many Meadows and Upland Pastures. The Seeds should be sown early.

The drought of last summer having caused partial failures in the ordinary Grass and Clover Leys, SUTTON'S Renovating Grass Seeds may be sown with great advantage *in all such cases.* PRICE REDUCED TO **9d.** PER POUND.

SUTTON & SONS *also supply Grass Seeds for laying down Land to Permanent Pasture at a moderate expense, the sorts being selected in accordance with the nature of the soil to be laid down, particulars of which may be obtained by post.*

Goods delivered Carriage Free by Rail.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

NOTICE.—For full particulars of EDWARD TILEY'S two unequalled new Cucumbers, Melons, and Seedling Potato, see advertisement in *Gardeners' Chronicle* of 24th February, 1855, page 128, together with an exact representation of the Cucumber, Sir Colin Campbell.

TWO NEW CUCUMBERS, SIR COLIN CAMPBELL and GENERAL CANROBERT, 3*s.* 6*d.* per packet, or a packet of each and a packet of either of the Melons mentioned in the advertisement of the above date (except Golden Drop and Scarlet King), for 6*s.*

TILEY'S SEEDLING POTATO, THE CHAMPION KIDNEY, the best and earliest in the world, price 5*s.* 6*d.* per peck, hamper and package included, or 1*l.* per bushel.

UNEQUALLED NEW MELON, GOLDEN DROP (Green Flesh), price 1*s.* 6*d.* per packet.

THE KING, a superb Scarlet Flesh Melon, 1*s.* 6*d.* per packet. A packet of Golden Dróp, one of the King Melon, together with a packet of any other variety mentioned in the former advertisement, will be forwarded post free on receipt of 3*s.* 6*d.* in cash or penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somersetshire.

TO NURSERYMEN.

TENDERS are required for the supply of the following TREES and SHRUBS, which are to be delivered during the month of March at the "Half Moon Inn," Godstone Road, in the Parish of Caterham, in the county of Surrey.—Tenders are to be addressed to ALFRED SMITH, Caterham, Croydon, Surrey.

All the following are to be 3 feet high:—

1000 Acacia Thorn.	1000 Scotch Firs.
5000 Ash.	1000 Weymouth Pine.
1000 Mountain Ash.	100 Cedrus deodara.
5000 Beech.	5000 Spruce.
1000 Weeping Beech.	1000 Lombardy Poplar.
5000 Weeping Birch.	5000 Larch.

New Priced Catalogues of Plants and Seeds free by post.

Albion Nursery, Stoke Newington, London.—March 10.

NEW BEDDING GERANIUM.

GAINES' SCARLET UNIQUE.

N. GAINES begs to inform the nobility, gentry, and trade in general that he can supply strong healthy plants of the above beautiful variety. In habit it is like Rollisson's Unique, producing magnificent trusses of brilliant scarlet flowers. It was exhibited at the Chiswick and Royal Botanic Horticultural Shows, where it was considered a great novelty, and well adapted for bedding purposes. Price 5*s.* per plant; when three are taken, a fourth will be sent to compensate for carriage.

A Descriptive List of his large Collection of Pelargoniums, Dahlias, both Show and Fancy varieties, also Stove, Greenhouse, and Hardwooded Plants, may be had post free, by applying at the Nursery, Surrey Lane, Battersea, Surrey.

PELARGONIUMS,

FUCHSIAS, PANSIES, VERBENAS, ETC.

JOHN DOBSON AND SON having a large and healthy stock of the above, beg to offer them at the low prices affixed; the plants are all in the finest health and require immediate repotting.

PELARGONIUMS from named varieties, 12*s.*, 21*s.*, 30*s.*, 42*s.*, and 63*s.* per dozen.

PANSIES, a first-rate collection, 6*s.*, 12*s.*, and 18*s.* per dozen.

FUCHSIAS, 12 fine varieties, including Vanguard, Queen of Hanover, Duchess of Lancaster, Glory, Duke of Wellington, &c., 10*s.*; older varieties, 9*s.* and 12*s.* per dozen.

VERBENAS, the best of last season's English and French varieties, 6*s.* and 9*s.* per dozen. A general descriptive Catalogue of the above may be had for one postage stamp.

Woodlands Nursery, Isleworth.

FOR MORE THAN A HUNDRED YEARS the SEEDS grown by WHEELER, of Gloucester, have been held in high repute in the West of England, for genuiness, purity, and excellent quality. The 3*l.* collection contains all the Seeds necessary for the year's supply of a large garden; the 30*s.* collection contains Sangster's No. 1, and Fairbeard's Nonpareil Peas; Wheeler's Imperial Cabbage; Bicton Cos Lettuce; Newington Wonder Beans; with other choice sorts of Peas, Beans, and Seeds suitable for a moderate-sized garden; and the 15*s.* collection comprises the Seeds suitable for a small garden.

These collections will be forwarded carriage free, and every dependence may be placed on the Seeds contained in them.—J. C. Wheeler & Son, Seed Growers, Gloucester, Seedsmen to the Gloucestershire Agricultural Society. Established in the early part of the 18th century.

NEW PANSIES.

WILLIAM JAMIESON is prepared to send out fine healthy plants of the following, viz.:—

CAPTAIN BARCLAY (Jamieson), yellow ground, upper petals dark glossy maroon, lower petals margined with the same, lies flat and perfectly smooth on the edge, ground colour all one shade. This flower was submitted to the Editor of the *Gardeners' Chronicle* for opinion, who thus notices it in that Paper, July 1, 1854, page 423:—"*W J P.* Your yellow ground flower is distinct and well shaped, with a good bold eye; it is of medium size, and we should say, if we may judge from the number of blooms sent, that it is constant; all the blooms (four) are uniform and good." 5*s.*

TOPAZ (Jamieson), deep yellow, fine form and substance. The following is the opinion of Mr. Turner, Editor of the "Florist," in the October Number, 1853:—"*W J P.* A very good yellow self, rich dense eye, medium size;" it was also awarded a Certificate at the Glasgow and West of Scotland Horticultural Show, August 17th, 1853; 5*s.*

The allowance to the trade. All orders must be accompanied by a remittance.—Address, William Jamieson, 4, Wellmeadow Street, Paisley, N.B.

SUPERB NEW HYBRID HEATHS.

LUCOMBE, PINCE, AND CO., are now prepared to send out their beautiful well-known New Hybrid HEATHS; they were exhibited at the Horticultural Society's meeting in Regent Street, and obtained the large Silver Medal. The following is the description given by the Editor of the *Gardeners' Chronicle*, May 28, 1853:—

"Messrs. Lucombe, Pince, and Co. *received a Large Silver Medal for a collection of new Hybrid Cape Heaths consisting of Lindleyana, Exonienis, Insignis, Pulcherrima, Exquisita, and Metulæflora superba, all fine kinds possessing large bold flowers and bright clear colours; they were stated to have been raised from Massoni, Ampullacea, Sprengelli, Hartnelli, and Aristata, all it will be seen good parents.*"

L., P., and Co. can assure all cultivators of this beautiful tribe of Plants that these fine varieties cannot fail to give satisfaction, as they possess excellent habits and have large rich coloured flowers of much substance, which are produced in great profusion, properties that fully justify L., P., and Co. in very strongly recommending them to the public. Price, 3*l.* the set of six.

Exeter Nursery, Exeter. Established 1720.

NEW PLANTS.

A. VERSCHAFFELT, Nurseryman, Ghent, Belgium, begs to offer to Amateurs and to the trade his following new plants:—

ACHIMENES (TREVIRANIA), AMBROISE VERSCHAFFELT. This is the finest Achimenes of all; a correct drawing is figured in L'Illustration Horticole, Number 1, 1855. Nice plants will be sent out next May, each 8*s.*—N.B. One over if three plants are taken.

TYDÆA WARSCEWICZI; magnificent plant for foliage, and particularly for the flowers. It is the finest gesneriaceous plant of all; a correct drawing is figured in L'Illustration Horticole, Number 1, 1855. Strong plants are now ready for sale, each 15*s.*—N.B. One over if two plants are taken.

RHODODENDRON (HARDY) PRINCE CAMILLE DE ROHAN. This is the finest hardy variety raised; a correct drawing is figured in L'Illustration Horticole, Number 2, 1855. This variety is warranted to be quite hardy, and very free bloomer. Nice plants will be sent out next May, each 15*s.* N.B. One over if three plants are taken.

Agent in London: Mr. R. Silberrad, 5, Harp Lane, Great Tower Street.

WILLIAMS' EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, have strong Plants of the above now ready for delivery. This highly interesting and valuable addition to the class of Evergreen Climbing Roses was raised by the late John Williams, Esq., of Pitmaston. It is a Seedling from Ayrshire Splendens, fertilised with Yellow Tea. Its rapid growth and elegant habit is precisely like the Ayrshire Splendens, while its glossy foliage and long lemon-coloured buds partake of the character of the Yellow Tea. Its flowers are creamy white, deliciously sweet-scented, and are borne in long racemes of 12 to 20 on a single shoot, being produced from every axil. It is highly desirable for covering walls, lattice work, verandahs, or buildings of any kind, and, as a pillar Rose, is unequalled, being of an extremely elegant habit for forming festoons or arches, and is also very hardy. For Bouquets it is a most beautiful variety, producing an immense number of its finely-formed buds. It only requires to be grown to be pronounced the best Climbing Rose for all purposes in cultivation.

Good established Plants at 3*s.* 6*d.* each, with the usual allowance to the trade, and a further reduction when one dozen or more are ordered at once.

AGRICULTURAL SEEDS,

MEADOW & PASTURE GRASSES, &C.

PETER LAWSON AND SON, of Edinburgh and London, the Queen's Seedsmen, Nurserymen, and Wood Foresters; and to the Highland and Agricultural Society of Scotland, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S. are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—

Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre ... ... 30*s.* per acre.

Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32*s.* per acre.

Mixtures for improving and renovating old Grass Land, 1*s.* per lb.

Mixtures (finest sorts) for forming Lawns... ... 1*s.* 3*d.* per lb.

These Seeds are are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE will shortly be ready, and will be forwarded free on application.

GEORGE GIBBS & CO., Seedsmen,

26, Down Street, Piccadilly, London.

CHARLES TURNER begs to intimate that his New SPRING CATALOGUE is now ready, and contains descriptive lists of—

IMPORTED GERMAN FLOWER SEEDS.

T. F. WINSTANLEY has received his annual importation (direct from Frankfort) of unrivalled Collections of German Seeds, including Double Ten-Week Stocks, Asters, Zinnia elegans, Truffeaus, new Pæony-flowered Aster, very beautiful, and many other varieties too numerous for insertion. Prices on application; lists free by post.

28, Market Place, Manchester.

BEAUTIFUL FLOWERS.—Twelve packets, each packet containing 100 Seeds, 1*s.*; sent free per post, 1*s.* 3*d.* a 5*s.* packet sent free per rail. Abronia umbellata, Eccremocarpus scaber, choice Gloxinias, Lophospermum Hendersoni, Lisianthus Russellianus, and every other choice variety 6*d.* per packet. Dwarf German (10 week) Stocks, as imported, 36 varieties, each variety 3*d.* per packet.—Wm. Cullingford, 1, Edmund Terrace, Ball's Pond, Islington, London.

N.B. Elletson's superb new late Dwarf White Broccoli Seed ("Emperor"), 2*s.* 6*d.* per packet. The Broccoli raised from this seed weigh from 17 lbs. to 25 lbs. each.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s.* per doz.; HOWARD'S PRINCE ALBERT, 12*s.* per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to Messrs. J. MYATT AND SONS.

Manor Farm, Deptford, March 10.

CHEAP AND GOOD CINERARIAS.—Fine flowering plants from Turner's best seed in large 60 and 48 pots, just coming into bloom, at from 4*s.* to 6*s.* per dozen. Also fine plants of named varieties, consisting of Mr. and Mrs. S. Herbert, Adela Villiers, Garland, Constellation, Lady Campbell, Kate Kearney, Flora M'Ivor, Étoile de Vénus, at 9*s.* per dozen.—Wood & Ingram, Nurseries, Huntingdon.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s.* per dozen.—The annual importation of the above named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. Corbett's Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived, very moist and open Parmasan Cheeses.

MAY'S MAGNUM BONUM LETTUCE.—Parties who were disappointed last season in receiving the above can now have it by early application, in Packets 1*s.* each, free by post. We have numerous letters to show, received from parties who had it last season, asserting that it is the most magnificent Lettuce they ever saw.—Address, Henry May, The Hope Nurseries, near Bedale, Yorkshire.

JOHN GRIGOR AND CO., Nurseries, Forres, N.B., have for sale several millions of Seedling and Transplanted TRUE HIGHLAND SCOTCH PINE PLANTS, raised from Seeds collected in the celebrated native Forests of Strathspey. They have received the numerous premiums hitherto awarded by the Highland and Agricultural Society of Scotland for the propagation of the true native Pine. The superiority of these plants compared with the produce of planted woods, degenerated by cultivation, will be seen on referring to the article "Pine Tree" in *Morton's Agricultural Cyclopædia*, published by Blackie and Son. Priced Lists on application.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Sunningdale Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by inclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is as delicate in point of texture the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL & Co., who will forward per post free on receipt of postage stamps) packets containing six seeds, 1s.; 18 Seeds, 2s. 6d.—"To Market Gardeners the above will be found a great acquisition."

Royal Nursery, Great Yarmouth.

GEORGE SMITH'S PRICED AND DESCRIPTIVE CATALOGUE of first-class Verbenas, Fuchsias, Geraniums (Show, Fancy, Variegated, and Scarlet), Dahlias, Chrysanthemums, splendid new Hollyhocks, very choice Petunias, &c., will be forwarded in return for one postage stamp.

The Geraniums are in extra fine condition, and require repotting. Parties giving orders immediately will save much in carriage, with less liability to damage by having them before they are repotted. Choice Verbena Seed from the finest show flowers.—Tollington Nursery, Hornsey Road, Islington, London.

ESTABLISHED ABOUT HALF A CENTURY.

SEED AND HORTICULTURAL ESTABLISHMENT,

SUDBURY, SUFFOLK.

BASS AND BROWN'S

NEW SEED AND PLANT LIST FOR 1855 contains

THEIR very select and choice Assortments of VEGETABLE and FLOWER SEEDS; superior Mixtures of the best GRASSES for PERMANENT PASTURES, PARKS, LAWNS, BOWLING GREENS, &c.; also AGRICULTURAL SEEDS of the finest selected Stocks; a great variety of Flower Roots and Bulbs suited for Spring Planting; descriptive lists of very choice collections of Achimenes, Gloxinias, Fuchsias, Verbenas, Petunias, Dahlias, Bedding Calceolarias, Chrysanthemums, Bedding Plants, &c.

The AUTUMN CATALOGUE contains lists of New and Select Stove and Greenhouse Plants, Geraniums, Cinerarias, Azaleas, Hollyhocks, Hardy Climbing Plants, Coniferæ, and other Select Trees and Shrubs, Roses, Herbaceous Plants, Fruits, &c.

Both Catalogues embrace a large amount of descriptive and useful information for the convenience of purchasers. Supplied free by post for three penny stamps each, or gratis to our customers who may not have received them.

GOODS (not under 20s.) CARRIAGE FREE to all the Stations in London, and all Stations on the Colchester Line, between London and Norwich.

The large number of letters of satisfaction and approval from persons receiving articles both of Seeds and Plants from our Establishment, and the annual increase of patronage of which we are every year in possession, is a certain proof that our care in providing the best of everything is appreciated by the public, to whom we desire to tender our best thanks.

BASS & BROWN'S ASSORTED COLLECTIONS OF VEGETABLE SEEDS

Contain everything which may be desired for superiority of sorts. The sorts and quantities of the collections are specified in the Catalogue. For any sorts not wished for, enlarged quantities of others sent to make up the amount.

A choice stock of Gladiolus lilium lancifolium, Tritonea aurea, Tigridius, Oxalis, Achimenes, Gloxinias, and a large number of other roots for spring planting, for which see Spring Catalogue.

Remittances required from unknown correspondents. Post-office Orders payable to BASS & BROWN, or STEPHEN BROWN. Stamps received for small amounts.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

SUTTON'S LAWN GRASS SEEDS,

AT THE CRYSTAL PALACE, SYDENHAM.

SUTTON AND SONS *have had the honour of supplying to the Crystal Palace Company the Grass Seeds by which so many acres of Arable Land have been converted into the beautiful Park and Lawns, now so much admired at Sydenham.*

The following letter has been received, besides many others:—*From Professor Lindley, Horticultural Society, 21, Regent Street, London.*—"We have already made trial of your Lawn Grass Seeds, and it is only justice to say that they have proved the best we have sown for many years."

Price 1s. per lb.; 2s. 6d. per gallon; or 20s. per bushel. Quantity required for forming new Garden Lawns, 2½ bushels, or 50 lbs.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

NEW EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, beg to intimate to their friends that they ARE NOW prepared to send out AT ONCE good strong plants of WILLIAMS' EVERGREEN CLIMBING ROSE, at 3s. 6d. each, with the usual allowance to the trade, and a still further reduction if one dozen or more are ordered at once. Price may be had on application.

N.B.—Single Plants will be sent free per post on receipt of six penny postage stamps EXTRA to defray postage. Strong Plants of the above may also be obtained at the same price from Mr. CHARLES TURNER, of the Royal Nursery, Slough.

DWARF-BUDDED ROSES,

ADAPTED EITHER FOR POTTING OR PLANTING IN GROUPS.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, have the pleasure of offering fine strong Plants of the following DWARF HYBRID PERPETUAL ROSES, at 15s. per dozen:—Baronne Prevost, Duchess of Sutherland, Jacques Lafitte, La Reine, Madame Trudeaux, Pius the Ninth (pillar Rose), Robin Hood.

The following at 10s. per dozen:—Madame Laffay, Marquise Boccella, Marquis of Ailsa, William Jesse.

N.B. A very liberal allowance to the trade on the above.

NEW ROSES.

WOOD'S DUCHESS OF NORFOLK, a superb bright crimson Hybrid Perpetual Pillar Rose, 10s. 6d. per plant. Usual discount to the trade, and a further reduction if six or more plants are ordered at once.

WILLIAMS' EVERGREEN CLIMBING ROSE, 3s. 6d. each. Usual discount to the trade.

NEW ASHLEAF—THE "EARLY CHAMPION."

JOSEPH WILSON, SEEDSMAN, Ipswich, offers the following splendid varieties:—

Per bushel.—	£	s.	d.
THE CHAMPION ASHLEAF, decidedly the finest and most prolific in cultivation	0	12	0
JACKSON'S IMPROVED ASHLEAF...	0	9	0
MOSS KIDNEYS (remarkably fine), per bushel of 56 lbs.	0	6	0
LORD RAGLAN, new Mammoth variety, per sack of 16 stones	2	2	0

All orders must be accompanied with a remittance. No charge for sacks or bags, and carriage paid to London for orders of 4 bushels and upwards.

NORTH CHINA SUGAR CANE—(HOLCUS SACCHARATUS). NEW CHINESE POTATO—(DIOSCOREA BATATAS).

MR. JOHN HENDERSON, of Kingskerswell, South Devon, is still prepared to supply and warrant genuine Seeds of the above Sugar Cane, and tubers of the New Chinese Potato, with description of the Chinese mode of culture at the following prices free, for cash:—

Holcus Saccharatus, in packets, at 1s., 2s. 6d., and 5s. each.
Dioscorea Batatas—four tubers, 10s.; ten ditto, 1l. 2s. 6d.

For further particulars as to culture, &c., see a pamphlet descriptive of the nature and progress of these plants, with directions for cultivation, by JOHN HENDERSON, price 1s., published by Mr. S. JOHNSON, St. Martin's Lane, and to be had of all booksellers. Post Office Orders are requested to be made payable at Newton Abbott, South Devon.

CHARLES SHARP begs to call the attention of the Nobility, Gentry, and the Trade to his unrivalled collection of SEED POTATOES, which have been grown and selected with great care, and perfectly free from disease. The undermentioned prices include hampers and package. Terms to the Trade known on application.

POTATOES:—

	Per bush. of 4 st.		Per bush. of 4 st.
Ash-leaf Kidney (Jackson's)	10s.	American Early	7s.
Ash-leafed Kidney (Walnut-leafed)	10s.	Forty-Fold	8s.
Early Emperor	10s.	Kentish Kidney	8s.
" Shilling's	10s.	York Regent's	6s.

" Oxford Large ...	8s.	French Blues	7s.
" Round Frame (for Forcing)	8s.	White Kidney	8s.
Early (Fox's Seedling) ...	8s.	British Queen, the largest and best produce in cultivation	8s.

Seed Establishment, Wisbeach, Cambridgeshire.

TO POTATO GROWERS.—ROSS'S AMERICAN EARLY, grown expressly for Seed on reclaimed Peat or Moor without manure. This well-known productive Potato cannot be equalled as a "second early;" price 21s. per sack of 2 cwt.

WALKER'S LARGE WHITE.—This variety is about two weeks later than the preceding, and for general crops cannot be surpassed. It grows to a large size, is an extraordinary cropper, and for table use is all that could be desired; price 24s. per sack of 2 cwt. *These prices include a strong sack, and carriage paid to London, Liverpool, and Hull.*

W. DRUMMOND AND SONS, SEEDSMEN, Stirling, N.B.

*** To prevent disappointment unknown correspondents will enclose a remittance with their order.

MYATT'S NEW SEEDLING POTATO. BROCKLEY KIDNEY.

W. AND J. MYATT can dispose of a limited quantity of the above excellent new Potato, which they have proved to be a first rate variety, and has been selected as the best out of many thousand seedlings raised at Manor Farm.

In flavour it is quite equal to the Ash-leaf, and for produce very far superior; it is a compact strong grower, and ripens off quickly, making it an invaluable summer variety. To be sent out in peck bags, 3s.; bushel, 56 lbs., 10s.

FIVE HUNDRED BUSHELS OF POTATOES TO THE ACRE.—This enormous crop was grown this year by a gentleman in Surrey, and out of which there were only 5 bushels diseased; nearly all the quantity were large sized, some weighing 2 lbs. and 1 oz., and not above 30 bushels of Chats out of the whole. This Potato was originally reared in Scotland, and is called by its grower the Scottish Champion. It is a good baker and boiler. Price 2l. 2s., inclusive of the sack of 3 bushels, delivered free at the South Western Railway station in London. Early application is necessary, as only a few sacks are for sale, the party growing intending to plant largely next season. A reference as to the quantity and quality can be given in the neighbourhood—Apply by letter, post-paid, to B. S., 4, Crooked Lane, London Bridge, where samples may be seen, and the name of the grower given.

All orders must be accompanied by a remittance.

GREAT YARMOUTH NURSERIES.

NOW THAT FROST HAS LOOSED HIS IRON HOLD, and the weather has again become propitious for the safe transmission of Plants, we beg to call the attention of our numerous Patrons and the Public at large to the very moderate prices at which we quote the following, merely premising that our Stock is this season very healthy and unusually large. CARRIAGE PAID on all Orders of 2*l.* and upwards, to any distance within 150 miles of the Nursery, and Good Plants added to compensate for this charge on packages of less value.

	s.	*d.*
Azaleas, in 50 fine varieties, good plants, principally in small tbs.; composed of such as the following—Amœna, obtusifolia, exquisite optima, Broughtoni, &c.—the collection	50	0
Ditto, per dozen, fine varieties	15	0
Aralia trifoliata, strong plants of this very unique shrub	5	0
Acacia grandis, 2*s.* 6*d.*; dealbata, 1*s.*; linearis, 1*s.*; virgata, 1*s.*; conspicua corticola, 1*s.*—the collection	6	6
Abutilon insigne (Lindenii), a new and fine species ...	2	0
Apheleia, in four fine varieties	4	0
Berberis aquifolium—the perfect hardihood of this plant is as yet somewhat doubtful, but its magnificent foliage and showy flowers recommend it to a place in every collection of choice plants, each	7	6
Boronia Drummondii, a fine new species, nice plants ...	2	6
Burchelina capensis rosea, a great improvement on an old favourite, strong plants	1	6
Cineraria—the following fine varieties, including novelties of last season, Vir, Etoile de Vase, John Bull, Marguerite d'Anjou, &c., per dozen	9	0
Chorozema flavum, 1*s.* 6*d.*; Lawrencianum, 1*s.*; Chandleri, 1*s.*; cordatum splendens, 1*s.* 6*d.*; rotundifolium, 1*s.*; Henchmanni, 1*s.* 6*d.*—the collection	6	0

Kennedya Marryattæ, 2*s.* 6*d.*; monophylla, 1*s.*; monoph. variegata, 1*s.* 6*d.*; ovata alba, 3*s.* 6*d.*; rubicunda maxima, 1*s.* 6*d.*; the collection	8	0
Hardenbergia monophylla	1	6
Mandevillea suaveolens, in fine strong plants	1	6
This is probably the finest conservatory climber we possess; flowers white and fragrant.		
Olea fragrans, good plants of this fine old favourite ...	1	6
Pimelea Hendersoni, grafted on decussata, good bushy plants, 3*s.* 6*d.*; smaller do., 2*s.* 6*d.*; Nieppergiana, grafted, 2*s.* 6*d.*; macrocephala, a new variety with large heads of flowers, grafted, 2*s.* 6*d.*; decussata, 1*s.*; the above are fine healthy stuff, not imported.		
Pittosporum Tobira; this, one of the finest evergreens we possess, owing to the supposed difficulty of propagating it, is to be met with but seldom; it is hardy in most localities, yet its fine glossy foliage and sweet-scented flowers recommend it to a place in the conservatory, where it may not be found to exist out of doors; strong plants	1	6
Polygala acuminata, 2*s.* 6*d.*; cordata, 1*s.* 6*d.*; Dalmasiana, 1*s.* 6*d.*; grandiflora, 2*s.* 6*d.*; the collection	7	0
Sollya Drummondi, 1*s.* 6*d.*; heterophylla, 1*s.* 6*d.*; linearis, 1*s.* 6*d.*; these blue-flowering plants are well suited to run up the pillars of a conservatory, or to cover trellises in pots.		
Tacsonia manicata, 2*s.* 6*d.*; mollissima, 1*s.* 6*d.* These are both magnificent climbers; when planted out in conservatories and allowed to hang in festoons from the roofs they flower freely, and, as the flowers depend, look extremely beautiful.		
Statice Holfordi, extra strong plants of this beautiful species	3	6
Stigmaphyllon ciliare, strong plants of this fine yellow creeper	2	6
Tecoma capensis, 1*s.* 6*d.*; Jasminoides, 1*s.* 6*d.*; Jasminoides rosea	2	6
These are old favourite climbers.		

	s.	*d.*
Tetratheca ericæfolia (true). This was the gem of the new greenhouse plants exhibited the season before last at the Horticultural Society's shows, each...	3	6
Tetratheca verticillata, and older species, very handsome	1	6
Myrtus Ugni; the new Chilian Myrtle, bearing fruit, very much prized in its own country, and likely to become useful for the dessert in this; in small well established plants	2	6
It is a plant of the easiest culture, and of an excellent habit.		

CONIFERÆ.

	s.	*d.*
Abies morinda, the Weeping Himalayan Spruce:—		
6 to 9 inches, per dozen	6	0
9 to 12 inches, "	9	0
12 to 15 inches, "	12	0
2 to 3 feet, each	2	6
4 to 5 feet, each, fine specimen	3	6
" **Menziesi**, 1 to 1½ feet, each 1*s* 6*d.*; per doz.	12	0
1½ to 2 feet, each 2*s.*; per doz.	24	0
This last species is remarkable for the bright silvery appearance of the foliage on the under side, which gives the tree as you stand under it a very striking expression.		
Abies orientalis, a neat and dwarf species, with short dark green foliage, pressed closely to its slender shoots; this as well as the two following are of compact and symmetrical form, and well adapted for situations on close shaven lawns, where tall shrubs or trees are not admissible. Strong plants, each 2*s.*; per dozen...	18	0
Abies pygmæa, each	3	6
" **pumila** (Waterer's variety), very bushy, each 2*s.* 6*d.*; per dozen	24	0
" **Whitmanniana** (new), 3 to 4 ins., each 5*s.*; per dozen	42	0
Araucaria imbricata, 15 to 18 in., each 5*s.*; per dozen ...	42	0
" " 1½ to 2 feet, each 7*s.* 6*d.*; " ...	72	0
" " 2 to 2½ feet, each 15*s.*; " ...	150	0
" " a few fine specimens, each 3 to 5 gs.		
Cedrus atlantica, a species from Mount Atlas, very hardy and very ornamental, 9 to 12 in., each 2*s*; per doz.	18	0
" **atlantica**, 12 to 15 in., each 2*s.* 6*d.*; per doz. ...	24	0
" " 1½ to 2 ft., each 3*s.* 6*d.*; per doz.... ...	36	0
" **deodara**, 2 to 2½ ft., each 3*s.* 6*d.*; per doz.	36	0
" " 2½ to 3 ft., each 5*s.*; per doz.	42	0
" " 3 to 4 ft., each 7*s.* 6*d.*; per doz.	72	0
" " 4 to 5 ft., each 10*s.* 6*d.*; per doz.	120	0
We will remark that the Deodars above quoted are all seedlings, very bushy, many whose diameter is fully equal to the height; that they are all planted in the open ground, and will remove with fine balls. To parties wishing to buy largely, we shall be happy to quote prices per hundred. It cannot be too generally known that when placed among Scotch and Spruce in common plantations they surpass these hardy and quick growing Firs in rate of growth, &c.		
Cephalotaxus Fortuni, fine specimens, 2 ft., each	21	0
" " smaller plants, each	5	0
Cryptomeria japonica, fine seedling plants, 2 ft. high, raised from seeds matured in this country; they were grown in the open ground, potted last autumn, and are in fine health; per doz.	21	0
Cupressus sempervirens of India, one year, per doz. ...	12	0
" " " 9 to 12 in. " ...	30	0
Of this species a most flattering description was sent with the seed, to the effect that it forms a most magnificent tree in its native habitat.		
Cupressus elegans (same as Knighti we believe), a species singularly beautiful, and need only to be seen to be admired; strong plants, 1½ to 2 feet, each	5	0
Cupressus elegans, smaller ditto, each	2	6
" funebris; this species, here on the most eastern point of Britain, is perfectly hardy; in its young state it forms a beautiful little bush, 1 to 1½ feet, each 2*s.*; per doz.	18	0
Cupressus funebris, 1½ to 2 feet, each 2*s.* 6*d.*; per doz. ...	24	0
" Goveniana, 12 inches " 2*s.* 6*d.*; " ...	24	0
" " 2 to 3 feet, nice specimens, each ...	5	0
" Lambertiana, fine plants of this magnificent tree, 2 to 2½ feet (for it assumes all the appearance of a Cedar as it advances in growth), 5*s.* each; per doz. ...	50	0
Cupressus macrocarpa; this fine species is sometimes confounded with the last named, but is certainly quite distinct, 12 to 18 inches, each 2*s.* 6*d.*; per doz.	24	0
Cupressus Uhdiana, 1½ to 2 feet, 2*s.* 6*d.* each; per doz. ...	24	0
" Whitloeana, a new species, 1½ to 2 feet, each ...	5	0
Dacrydium Franklini, 6 to 9 inches, each 2*s.* 6*d.*; per doz.	24	0
Juniperus Bedfordiana, 9 to 12 inches, each 1*s.* 6*d.*; per doz.	12	0
" " 1 to 1½ feet, each 2*s.*; per doz. ...	21	0
" " 2 feet, each 2*s* 6*d.*; per doz. ...	24	0
(a very hardy, free growing, ornamental species).

Deutzia gracilis, nice plants, per dozen	1	6
" crenata, new, each		
Erica, Mediterranea, Ciliaris, Vagans, Vagans alba, Herbacea, Tetralix alba, &c., per doz. varieties	9	0
Escallonia macrantha, a plant unrivalled for the beauty of its foliage, while its rose-coloured flowers, produced freely in the spring and autumn, are very attractive; strong plants, each	1	6
Euonymus japonica variegata, a handsome old favourite, per dozen	9	
Forsythia viridissima, 2 to 3 feet, each	1	0
" " 3 to 4 feet, each		
An importation from China, producing its primrose-coloured flowers abundantly, early in spring.		
Ilex castaneæfolia (Chesnut-leaved Holly), strong, each	2	6
" latifolia, the Laurel-leaved, 2 to 3 feet, each	3	6
" " " 3 to 4 feet, fine, each ...	5	0
Ligustrum japonicum, a new and handsome evergreen shrub; it produces large panicles of cream coloured flowers in the autumn; good plants, each	1	
Pernettya speciosa, a new and very neat species, each ...	1	
Philadelphus Gordoniana, fine, each	1	6
" mexicana, good plants, each		
An exquisite free flowering little shrub, rivalling the Orange in fragrance.		
Philadelphus, new species from California, each	2	6
Quercus Fordi, undoubtedly one of the handsomest and hardiest of low evergreen trees, its habit is most compact and symmetrical, 9 to 12 in. each 1*s.* 6*d.*; 2 to 3 ft. each	3	6
Roses, named and choice varieties on their own roots, our selection, per 100	36	0
Roses, climbing ditto, in choice variety, per doz.	6	
" Fortuniana, new white Banksia, strong plants, each	2	6
" common white and yellow Banksias, strong plants "	1	6
Wistaria sinensis, strong plants, each from ... 1*s.* 6*d.* to	3	6
" " alba, this fine new variety from China in good plants, each	7	6
Weigelia amabilis, a great improvement on the older var. rosea, each	2	6
Weigelia rosea, strong plants, per doz.	12	
Yucca gloriosa superba, strong plants, each ... 3*s.* 6*d.* to	5	0

Post Office Orders to be made payable to YOUELL & Co.—A Remittance or Reference is requested from unknown Correspondents.

YOUELL & CO., ROYAL NURSERY, GREAT YARMOUTH.

ACHIMENES, GLOXINIAS, ETC.

BASS AND BROWN have a large stock of fine Tubers of the following, which they can supply to the trade in quantities. Prices on application.

Achimenes Cherita.
" Mr. Aparpart.
" Louis Van Houtte.
" Margaretta (best white).
" Magnifica purpurea.
" Sir Traherne Thomas.

Gloxinea Leonie Van Houtte.
" Hogoveen.
" Willsoni.
" Duke of Wellington.

Verbenas, 60 new varieties of 1854, of the first raisers.

☞ A quantity of Corræa and Pimelea Stocks Wanted.
Sudbury, Suffolk.

NEW AND RARE CONIFERÆ.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, have still on hand a small quantity of the Seeds of the following RARE CONIFERÆ, &c.:

	£ s. d.		
Pinus Lambertiana, 50 Seeds	1 5 0	Taxus Lindleyana (quite new) 50 Seeds ...	2 2 0
P. tuberculata, entire cones	2 2 0	Club-headed Wheat (cultivated by the old Californians) 200 grains	1 0 0
P. monticola, 50 Seeds ...	2 2 0	Wheat (a variety of Triticum durum) do.	15 0
P. Jeffreyi do. ...	2 2 0		
P. Beardsleyi do. ...	2 2 0		
Libocedrus decurrens, do.	1 5 0		

Full descriptions will be found in the last page of the *Gardeners' Chronicle*, for Feb. 3.—Orders may be addressed to PETER LAWSON & SON, in Edinburgh; or to their London House, 27, Great George Street, Westminster.

BEAUTIFUL SEMI-DOUBLE PRIMULAS.—Only a few packets remain on hand. To prevent disappointment, order without delay.

The celebrated Ipswich Standard Cucumber is sold out, only 12 seeds left.—THOMAS WILD, Ipswich.

BANKS' SEEDLING FUCHSIAS.—1855.

(FOR FULL DESCRIPTION SEE FORMER ADVERTISEMENTS, AND ON APPLICATION).

W. J. EPPS has much pleasure in stating that the above Fuchsias have been proved to be the finest that have been raised by that celebrated grower E. Banks, Esq., Deal. Early orders are solicited. The set of six 2*l.* 2*s.* The usual discount to the trade.—Bower Nurseries, Maidstone.

THE ANNUAL SPRING EXHIBITION OF PLANTS IN THE EXETER NURSERY.

LUCOMBE, PINCE AND Co. very respectfully beg leave to announce that their superb specimens of CAMELLIAS are now in flower; they are particularly fine this season, and great additions have been made to their collection. Their New Show House is also filled with an extensive assortment of various Fine Plants, which cannot fail to gratify those who pay their Nursery a visit, as it is now, and will continue for a long time to be exceedingly brilliant and attractive with all the gayest Spring and other Choice Flowers.

L., P., & Co. have now several experienced Gardeners whom they can strongly recommend.—Exeter Nursery, Exeter. Mar. 10.

The Gardeners' Chronicle.

SATURDAY, MARCH 10, 1855.

SOME years ago M. MASSON, an ingenious French gardener, conceived the possibility of so preserving esculent vegetables that while their bulk was reduced to a minimum, and their quality remained unimpaired, they should be secured against decomposition for a very long time. It is well known that the large space occupied by vegetables is owing in part to the water they contain, and in part to the looseness of their tissue; it is also known that the decay which ensues when they pass into a state of fermentation is rapid or the contrary, in proportion to the water lodged in their substance; if absolutely dry they undergo no putrefactive change whatever. M. MASSON proposed in the first place to deprive them of the greater part of their mere water, by exposing them to a current of warm dry air till about 90 per cent. was removed, when they become tough leathery bodies, with little tendency to decay. In the second place they were to be subjected to violent pressure, so as to expel the air and convert them into solid masses. These objects have been so skilfully carried out that the compressed vegetables can scarcely be said to differ from the fresh; and certainly lose in the operation no part whatever of their nutritive or sanitary qualities. In reality they part with nothing but water; not even aroma disappearing, nor any burnt or other unnatural taste being communicated by the process of drying. The invention became the subject of a patent, and soon attracted the attention of the French.

In 1851 specimens of the preparation were shown in the Great Exhibition in Hyde Park, and received a Council Medal, the highest honour which the judges could confer. In the report of the juries the preparation is spoken of in the following words:—

"MASSON's dried compressed vegetables demand especial notice, as showing one of the most remarkable discoveries of modern times in this branch of manufacture. By MASSON's process the most bulky, soft, and succulent vegetables are reduced to a fraction of their volume, and are preserved in a dry, indestructible state. After boiling for a rather longer time than usual, they are restored to something of their original form and consistence, retaining all their nutritious principles, and much of their flavour. CHOLLET and Co., the manufacturers of these preserved vegetables, use only desiccation and compression in the process, which is MASSON's invention. According to a statement published in the 'Comptes Rendus,' as read before the Paris Academy, the vegetables are reduced seven-eighths in weight, and proportionally in bulk. They require to be boiled for one hour and a half to one hour and three quarters, and on cooling, are found to have regained nearly all their evaporated juices. If, as the jurors have reason to believe, these preparations retain their good qualities for several years, they cannot be too strongly recommended to public attention. It would probably be necessary for long voyages that these square cakes be packed in perfectly dry casks or tanks, as biscuits are."

In November, 1851, a commission consisting of French naval and victualling officers strongly recommended their introduction into the stores provided for sailors, and ordered a supply for nine vessels of war. In August, 1852, a French medical commission adopted the views of the naval board, and recommended them to be introduced largely into the commissariat of the army of Algiers. We understand that since that time they have formed a most important part of the supplies provided for the service of all French armaments.

Last Tuesday a cake of this substance, as provided for the French service by Messrs. CHOLLET & Co., who work the patent, was exhibited to the Horticultural Society. It weighed 6 lbs., cost 7*s.* 6*d.*, and was sufficient for 120 rations. Nothing could surpass the freshness and fragrance of the preparation; so that for three farthings a head a meal of valuable nutritious anti-scorbutic food is at the command of any commissariat. The value attached by the French navy to this important preparation will be seen by the following extract from a letter addressed to the Minister of Marine by Admiral HAMELIN, dated from on board the Ville de Paris, lying off the Katcha, October 8, 1854, while acknowledging the arrival of 17,000 kilos or more than 37,000 lbs. "These vegetables have been received with the greatest satisfaction, and their effect upon the health of the men is already manifest. We were threatened by epidemic scurvy; but from the time that the vegetables have been served out an improvement has taken place, swellings and ulcerations of the gums begin to disappear, and the condition of the men is sensibly better. As the season advances we shall have no fresh vegetables, which can never be obtained on an enemy's coast without extreme difficulty; and therefore another supply of these preserved vegetables would be most welcome. The health of the men, which has become a good deal impaired, will be preserved, and your name will be identified with one of the greatest improvements which have been introduced into victualling the fleet."

Considering the length of time that this preparation has been known, its cheapness, its portability, its durability, and its unquestionable excellence, it might have been expected to have found its way into the English service, and that some means would have been taken in our own victualling yards to secure the right of working MASSON's patent, or that our own market-gardeners might have derived some advantage from the increased demand which would have followed its adoption. But with the exception of a small order sent to Paris by the Admiralty, nothing had been done about it when the late Minister of War quitted office: we hear, indeed, that some prepared vegetables had been purchased by him for the Crimea; but they were not such as the experience of the French has taught them to prefer, and would seem to have rotted in the Balaklava limbo if they ever reached it.

But it is not merely because of the importance of MASSON's vegetables in time of war that we have thought it desirable to bring them thus into notice; on the contrary, it is for the sake of ourselves at home, of our great mercantile marine, and of our numerous market gardens, that we wish them to be better known. For surely in a country like this, in which all hopes of fresh vegetables at moderate prices are effectually dispelled for weeks to come by the severity of any hard winter, it is a matter of the first necessity that such a method as that of MASSON should come into common use. Thousands of pounds' worth of Cabbages have utterly perished round London, all which might have been saved had there been a London CHOLLET to buy them up and secure them by the simple process before us. And the poor, instead of being left without a chance of fresh vegetable diet until the end of March, at the soonest, might have bought in any grocer's shop an abundant supply at even a less cost than in the summer. It is to be hoped, then, that enterprising persons will be found to secure the right of working in this country the patent by which such important results are obtained, and that in future we may be placed beyond the reach of a scarcity of fresh vegetables, whether arising from season, mildew, or other causes.

THE experiments of M. FABRE on the ORIGIN OF WHEAT, and the consequent conclusions adopted by several distinguished naturalists that most of our cultivated Wheats were derived from species of Ægilops, have excited great interest on the continent of Europe. Botanists, whose ideas on the specific distinction of plants marked by slight differences have been carried very far, have felt that their principles would be much shaken if it were admitted that two plants in their opinion so totally different had a common origin, and several refutations of M. DUNAL's arguments have been attempted, although hitherto without much success.

M. GODRON, of Besançon, one of the authors of the "Flore de France," now in course of publication, has just, however, communicated to the "Annales des Sciences Naturelles" the result of his observations and experiments, which he considers as removing all weight from the arguments of MM. FABRE and DUNAL by accounting otherwise for the phenomena on which they were founded.

The Ægilops triticoides, the intermediate form or transitionary state between Æ. ovata and Wheat, is, according to M. GODRON, when growing wild, found on the edges of Wheat fields in a country where Æ. ovata is a common weed, and under other circumstances of growth, which suggested to him the idea that it was a natural hybrid between those two plants. He has confirmed this view by actual experiment, fertilising Æ. ovata with the pollen of Wheat, and thus producing artificially the Æ. triticoides.

M. GODRON concludes, therefore, that "the observations made by M. FABRE on the Æ. triticoides do not in any manner prove that our cultivated Wheat has for its origin the Æ. ovata, nor that one species can transform itself into another." Some friends of his in German journals go further, and assert that he has positively disproved M. DUNAL's conclusions.

We have nothing to say as to the transformation of one "species" into another, for according to our notion of the meaning of the word, this circumstance would but prove that the two supposed species were in fact only varieties or races more or less permanent of one species. We would, however, make some observations on the remainder of M. GODRON's paper.

It is admitted that Triticum sativum and Ægilops ovata are strictly congeners, as confirmed by the form of the caryopsis; that Æ. triticoides is the first known instance of a hybrid among Grasses; that M. FABRE raised from seeds of a wild Æ. triticoides plants which produced perfect seed, which he again sowed and continued the operation during 12 successive generations, and that during these 12 years' careful cultivation the plants gradually acquired more and more the character of Wheat; that Æ. triticoides is occasionally, though rarely, found in sterile places surrounded by vineyards.

But M. GODRON observes that there were abundance of Wheat fields in the neighbourhood of the spot where M. FABRE carried on his experiments, from whence the pollen might have been wafted so as to fecundate his plants and produce that gradual assimilation according to the laws of hybrids. So also in the case of the Æ. triticoides in the midst of vineyards, there was quite Wheat enough cultivated in the surrounding country for some of the pollen to have found its way over to the parent plant of Æ. ovata.

Even admitting this extraordinary dispersive power of the pollen of Wheat, and that Æ. triticoides as now produced is always of hybrid origin, it appears to us that this very great facility of natural hybridisation in a family where it is so rare as to have been hitherto unobserved, would appear to prove much rather that the two plants had a common origin, than that they are really distinct species.

Another point much relied on by M. GODRON is that the first start from Æ. ovata to Æ. triticoides is very great, and that there are no intermediates between two plants so distinct as to be universally admitted as species. That such should be the case with M. GODRON's artificial crops would naturally be expected, but that it is so in the wild plant remains to be proved. Most of the supposed species of Ægilops, in the South of Europe, are very variable, and run so much one into another, that few botanists can agree as to what are or are not species amongst them.

With regard to the rarity of Æ. triticoides in a wild state, we may observe as a well-known fact, that when aberrant forms of natural species are produced from causes unknown to us, and therefore termed *accidental varieties*, various circumstances tend in a wild state to restrict the number of individuals, or cause the varieties to disappear altogether, whilst they may be rendered permanent by cultivation.

In our opinion, therefore, all that M. GODRON has proved is, that Triticum sativum and Ægilops ovata are species so nearly allied that they hybridise with a facility very unusual amongst Grasses; but

we re-assert that this is no proof that the two plants are distinct species. *B.*

To this we would add that neither M. Godron nor M. Alexis Jordan, who has filled 100 pages of the Memoirs of the Academy of Sciences of Lyons with speculations upon the origin of domesticated plants, have attempted to explain what the origin of Wheat has been, if it is not a domesticated condition of Ægilops, as M. Fabre's experiments, in our opinion, prove it to be.

New Plants.

117. Viola capillaris. *Persoon. Van Houtte, Fl. des serres t.* 983.

A little greenhouse violet from Chili, with entangled erect stems, small rugose leaves, and flowers the colour of the Neapolitan. It is a pretty little thing, thriving in equal parts of leaf-mould, sand, and loam, and flowering from May or June to August, but it is not fragant.

116. Tydæa gigantea. *Planchon in Van Houtte, Fl. des serres tt.* 975-6.

A stately stove plant, obtained by crossing Sciadocalyx Warczewiczii with Achimenes picta. It seems to have the noble aspect of the former and the gay yellow and scarlet spotted flowers of the latter. It was raised in the garden of M. Van Houtte by Mr. Roezl, and is no doubt one of the finest of its brilliant race. M. Planchon assures us that the flowers hang on much better than usual, a circumstance which he attributes to their being sterile.

VEGETABLE PATHOLOGY.—No. LXII.

276. Apostaxis. *Accidental and Functional.*—1. Honey Dew.—The leaves of plants during hot and sultry weather, or occasionally when the temperature is lower, are covered, as with a varnish, with a sweet sticky coat, which is popularly known under the name of honey dew. It is commonly believed that this substance falls from the clouds, and it is in consequence said in cold damp seasons, there will be no honey this year, because there has been no honey fall. In this, as in most popular opinions, there is some shade of truth mixed up with error, inasmuch as the same seasons which are favourable to honey dew are also productive of honey. Apart, however, from popular opinion, several notions have prevailed amongst those who profess to have examined matters more accurately; but till a correct chemical analysis has been made of these sweet deposits under different circumstances, the question must still remain in a certain degree of obscurity. The probability is that the deposits are not always of precisely the same chemical nature, and it is certain that they arise from at least two sources totally distinct. In all cases the appearance is in great measure confined to the upper surface of the leaf—a fact which has had no small part in the arguments to which the subject has given rise.

277. The most ancient notion, and that which, as said above, is still most popular, is that it arises from the deposits on the leaves of a sweet substance falling from the air. It is in general scarcely attempted to show whence this sugary vapour or rain may be derived, except so far as the indication may go that it usually takes place when the larger number of plants are in bloom, from which it may possibly be an emanation. If such were the case it ought not to be confined to individual trees or species, but every plant alike should be covered, and not only so, but every surrounding object should equally be coated with the sweet varnish. Instances indeed are sometimes alleged in which this has been the case, but such supposed facts require close investigation, and the report seldom comes from persons of scientific habits, who are sufficiently accustomed to observation to insure the absence of error. Wiegmann* in his little treatise on the diseases of plants assures us that such deposits do take place, accompanied by fine rain. He says that he has himself seen in an afternoon in the beginning of June nearly half an acre in his garden completely covered with honey dew. Not only bitter plants, such as Wormwood and the bitter Thistle (Cnicus Benedictus), but the garden benches, tools, plant markers, &c., were equally varnished, while beyond a strictly defined limit not a trace of the phenomenon was visible. In this case till after the deposit there was no personal inspection, and a subsequent storm prevented the collection of the sugary matter for examination. He relates also a case reported to him by Dr. Ritz, of Mayence, in which a sweet substance was seen to fall in little drops between the branches of the trees while the sun was shining, and, as in the former case, covering every object which was exposed to it. The air was at the time filled with dipterous insects, from which the matter might have fallen. Allowing, however, that such observations are correct, they are at least exceptional, and capable, as will be seen presently, of explanation, and will only help to show that honey dew may arise in more ways than one.

278. Some authors are inclined to refer every case of honey dew to the agency of the different species of aphis. It is quite certain that a sweet substance is squirted from the processes on their body, and that many cases of honey dew arise from it, though it is as certain that cases occur where no aphis is present. They occupy principally the under side of leaves, though not exclusively, which would account for the deposits being almost wholly confined to the upper surface of the leaves. It is clear that in this case, as well as the last, though mischief may ultimately arise to the plant from the deposit, there is no question of Vegetable Pathology.

279. There are, however, undoubtedly cases, and those of great frequency, in which the honey arises either immediately from an exusion of sugary matter from the upper surface of the leaves, commencing at distinct points and gradually spreading and becoming confluent, or by the deposit of similar sugary matter, dropping from the stomata of the lower surface. In such cases we have real apostaxis, which is due to peculiar conditions of the atmosphere, which have not at present been fully examined, and is no less observable in healthy than unhealthy individuals. In such cases we have ourselves observed objects like garden seats placed under the trees covered with honey dew, but we have never seen such a phenomenon in situations which were not in the immediate neighbourhood of trees. And such cases as those mentioned under the last section may really be due to matter descending from trees and carried by currents to particular spots, exactly as in the case of the yellow rain which is due to pollen. It is very possible that immense secretion of honey dew may be exhausting to plants, though it probably acts as a natural relief in many cases. Hartig reports a case of a Rose tree, in which, after a copious discharge of sugary matter, the leaves lost their green colour, the cells collapsed, and the chlorophyll was exhausted. Loudon asserts that diseased plants, such as Hops that have been injured by the larva of the Hepialus, are most subject to honey dew, but we have not observed such to be the case.

280. Besides any direct injury which may arise from the copious excretion of honey dew, the respiratory functions may be impeded, though not to such an extent as if the deposit was on the lower surface of the leaf. If, however, rain does not wash off the sugar, moulds like Cladosporium, Antennaria, and Capnodium are soon developed, and the dark velvety coat which arises from them not merely impedes respiration, but prevents the due action of light upon the tissues, obstructing one of the most important functions of vegetation.

281. The sweet substance like honey which appears in the inflorescence of Grasses attacked by ergot is probably a species of honey dew arising from disease. Oidium abortifaciens, which before the recent observations of Tulasne, was supposed to be the fungus which produces ergot, may possibly be a condition of some yeast fungus developed in the sweet matter; but this is merely thrown out for the present by way of suggestion. *M. J. B.*

* Wiegmann, Die Krankheiten und krankhaften Mißbildungen der Gewächse. 1839, p. 102.

RECLAIMING UMBRELLA-HEADED TREES.

The following is my method of reclaiming stunted umbrella-headed trees, such as are alluded to in my remarks on Delamere Forest and the Chopwell woods, in your volume for 1854, page 709. Permit me to premise, however, that I could give in the woods a more convincing illustration of the method in question in 10 minutes than any written description could possibly convey, but as it is unlikely I can have many opportunities of giving such lessons, I will endeavour to furnish as plain directions as I possibly can, how to proceed with the operations for the renovation of such trees.

Let us begin with a bushy-headed Oak from 4 to 8 feet in height, say of 14 or 15 years' growth more or less. Take, for example, such a one as is represented in fig. 1; looking at it, can anything be imagined more likely to remain a cumberer of the ground? I commence by taking off most of the strongest side branches close to the stem, shortening the other small ones so as to bring them within a reasonable compass. I then ring the bark about half an inch wide on the upper strong branches close to the stem, leaving about an inch (more or less, according to circumstances) in the centre or fork of the tree, to produce a central shoot for a future leader, by which process I force the space left in the centre to throw out several shoots — the strongest and best-placed I select for the leader. At the end of the first year I thin and shorten the other shoots, thereby throwing the main force of the sap into the leader; the other shoots left should be removed at the beginning of the second year's growth, before they have time to compete with or injure the permanent leader. If this operation is attended to in the second year, the tree will have the appearance represented by fig. 2.

Fig. 1.—Stunted Tree.

Fig. 2.—Second Year.

In all cases of hide-bound and unhealthy trees, I slit the bark along the stem from the ground to where the new leader is to be produced. By this operation the sap flows more freely, to the manifest benefit of the new growth, viz, the leader. Any small spray from the upper old branches that inclines inwards where the young leader springs from should be shortened, so as not to encroach or injure it; while, at the same time, they would form a shelter which would prevent it from being broken or blown on one side by the wind till it has acquired sufficient strength to brave the storm itself. In the autumn of the third year all the old side branches of the old stem should be sawn close off, when the previously stunted tree will have the promising appearance represented by fig. 3. It is a remarkable fact that the bark heals over a wound as well after the saw as the knife, so that smoothing with the knife after the saw is, in most cases, unnecessary.

Fig. 3.—Third Year.

By the end of the third or fourth year the renovated tree will have acquired great vigour, and may be trained to any required height before it is finally left to itself; and thus I could have renovated and reclaimed, I believe I may say, all those decrepid, dwarf, bushy-headed trees in Delamere Forest, and unfortunately in too many other places.

When operating on crooked, ill-formed, scraggy trees, not bushy-headed, I head them off at the place most suitable for producing a new leader; but this is rather a nice operation, requiring both experience and judgment, and they demand careful looking after for two or three years. Heading off without after training—like planting without early care afterwards—the result will only be disappointment and loss of both time and money.

In hedge rows and parks single trees naturally throw out numerous strong side branches near the ground; such trees require training to acquire a clean straight stem to any desirable height before they are permitted to assume their beautiful natural habits of growth. By this process of training when young they advance much faster in height, and there are no thick branches to be removed to make the stem unsightly where no branches are required.

In enclosed plantations and groups in parks and lawns the outside trees should be trained with shorter stems than those in the interior, as being more natural and beautiful. The interior trees will naturally draw themselves up straight and tall with but little training. But to produce valuable and at the same time ornamental timber, great care must be taken to give plenty of head-room as soon as the tops begin to encroach on each other, or to a great extent it will be labour in vain. But after all I am fully convinced that until experimental plantations are provided near the metropolis where landed proprietors and planters occasionally resort either for pleasure or business, and where they could see living examples of the value and convincing utility of the process, until, I say, something of this kind is established, or a Royal English Arboricultural Society is formed, I am confident, from a very lengthened experience, that little progress will be made in the true system of forest management. No written description, as I have already said, will effect the object in view. Some never read, and others soon forget what they do read on such subjects. Then why not try the system upon a small scale at first in some of the Royal forests, where there are some young plantations—say Dean, Delamere, and the New Forest—till the Lords of the Treasury and the Commissioners of Woods, &c. &c., are convinced by examples of the paramount utility of my plan. *W. Billington, Roy, Belmullet, Mayo, Ireland.*

EXTRACTS FROM ANNUAL REPORT

FROM THE

CURATOR OF THE BOTANIC GARDEN, GLASNEVIN

January, 1855.

The Museum of Economic Botany has proved a great source of additional interest to the public during the past summer, though it still is in a very imperfect state. Whether this may have arisen more from its novelty, or from its real importance, I am unable to state, but certainly no other department of the Garden has been so much frequented by visitors as the Museum. It is consequently to be desired that its true value, both in an economic and educational point of view, may be fully understood, and lead to its being supported in the same respectable manner as the Museums of Economic Botany which are attached to the Kew and Edinburgh Gardens.

In the experimental portions of the Garden, trials have been again made on the growing of root crops at different distances. I reported on this subject last year, when the results were in favour of sowing moderately thick, which is also the case in the present instance. Plots of ground 18 yards wide, by 12 long, were sown with Mangold Wurzel. On one, the drills were 18 inches apart, and the plants stood 9 inches apart in the drills. The produce of this weighed 1 ton, 2 cwt. 1 qr. Another of same dimensions, on which the drills were 3 feet apart, and the plants 18 inches in the drills, only produced 16 cwt. Both spaces were manured alike, and

side by side. Some experiments were tried with manures. A plot 18 yards wide, by 12 long, manured with bog-mould and salt mixed, produced 14 cwt. of Mangold roots. Another of same dimensions, manured with equal parts of bog-mould, salt, and stable manure, produced 17 cwt.; and a third, with stable-yard manure alone, produced 1 ton 4 cwt. The weights of manures put on each division were equal. Further trials with other fertilising materials supplied by a gentleman who takes much interest in those matters have been made, but owing to the lateness of the season when they were sent, the experiments did not get a fair trial. I shall, therefore, reserve making any special report on them at present, and only state that they afforded proof of having considerable stimulating qualities.

The growing of seedling Potatoes has been particularly attended to this year. Last April the Assistant Secretary sent to me 115 kinds of those seedlings, raised by Mr. Anderson of Fermoy, at ages varying from two to four years, all of which had either names attached, or notes describing their merits. It was stated, that Mr. Anderson desired to have them tried and proved in the Botanic Garden. They were accordingly planted with much care, and samples of the produce of 109 of the kinds are now in the Exhibition of Farm Produce, at the Agricultural Museum of the Society. It affords me pleasure to report that there are some first-rate kinds among them, both as regards quality and prolific yield; and I have no doubt but they will soon take their places as standard varieties for general cultivation; but, so far as their being proof against blight, such is not the case. The haulm of every one of them was cut down in common with the ordinary varieties, when the blight prevailed in August, but when dug in October the tubers of a good many of the kinds were quite sound, whilst others had about one-half diseased. The remarks attached to the samples sent to the Exhibition will show the effects as they occurred.

Supplies of plants and flowers have been regularly sent twice in each week to the School of Art; 750 examples from the Conservatories, and 2533 from the outside grounds, besides private supplies to pupils who came to the Garden and selected for themselves.

The Professors of the Royal College of Surgeons, and Peter Street School of Medicine, have been supplied with specimens for illustrating their lectures; and plants and flowers were freely sent to the Museum of Industry, Stephen's Green, for Dr. Allman's lectures in that institution.

Although no official order was issued until lately for affording the public access more freely to the Garden, I acted in some degree on my own responsibility, and admitted them (strangers especially) throughout the summer, knowing it to be the desire of the Committee of Botany, and members of the Society, to make the institution as useful as possible. From 31st December, 1853, to 31st December, 1854, thirty-seven thousand six hundred and thirty-eight persons visited the Garden, exclusive of nearly three thousand who attended the horticultural fête.

I have again reluctantly to call your attention to the state of the dwelling-house, trusting that for the beautifying of your Garden, the comfort of your officer, and for economic considerations, special information may be called for on this subject. *D. Moore, Dec.* 30, 1854.

COMMON THINGS.

Pruning and Training Nut-bushes.—As soon as young plants are established, some pains should be taken to give their heads a proper form, which may be done in a similar manner to that recommended for Gooseberries and Currants. If it is intended to keep the plants under a regular system of pruning, they must be kept low, so that their upper portions may be reached standing on the ground, both for the purposes of pruning and of gathering the fruit. Their heads must be kept thin, shortening the leading shoots to 9 or 12 inches, and cutting out such other strong ones as would if left encumber the head. Besides these, there will be also produced from the two or three years' branches, annually, short twigs of 6 or 9 inches in length, which generally bear a great many Nuts the following year; these should be thinned out, but not shortened, leaving them in tolerable quantity wherever they are produced, cutting them clean out the following winter, and leaving others in the same manner as those had been left the previous season. In Kent, Nuts are better managed than in most other parts of England. The bushes there are pruned much in the manner just described, their branches being wide apart, and the middle of the bushes very open. Some may, however, deem it too much trouble to prune Nut trees in a regular way; should this be the case, something still may be done to prevent their running into a wild state in which they generally are. They may be looked over for the first two or three years after planting, till their heads have been formed into a kind of regular shape; but even then, it would take but little time to have them looked over once a year about this time, to clear away suckers and thin out their heads, remembering that where the latter are crowded with wood the crop is always defective, except, perhaps, near the extremity of the branches; on the contrary, where the bushes are thin, Nuts are generally good and abundant.

Propagation of Currants.—These are increased by cuttings only where good and handsome bushes are required. For this purpose strong young shoots should be selected which are straight, and about 12 inches of the lowest part of each should be made use of. The eyes from 6 or 8 inches of each cutting should be cut out previously to planting, which prevents suckers from being thrown out about the roots. When they have been two years in the nursery bed, and have formed heads of four or five shoots, they may be planted where they are intended to remain, taking care to have a stem of 8 inches clear above ground to each plant.

TRADE MEMORANDA.

Beware of a man who is representing himself as gardener to a merchant, and who purchases plants and greenhouse work upon false representations. His aim seems to be to live on his dupes a few days, and if he can to borrow cash, and give them the slip without notice. His height is about 5 feet 4 inches, black hair and whiskers, black coat and trousers, black figured waistcoat. Answers to different names.

Home Correspondence.

An Irish Loy and the Price of Digging.—You have invited from your friends accounts of rates paid, &c., for digging. By statements published by the Society of Friends, in the *Irish Farmers' Gazette* of 1849, of their farms in Connaught, it appears that they got their land dug 9 inches deep for 9*s.* 6*d.* an acre (statute). At the same period other accounts stated that Connaught men would dig an acre of stubble land when light 9 inches deep for 6*s.* 8*d.*, and when heavy for 10*s.* But 1849 was a period of labour deterioration, when men were found glad to work even in Leinster for 4*d.* or 6*d.* a day, or merely for their own food, their families being half starved and wandering beggars through the country. In ordinary years a very general rate for turning land (as No. 1, see p. 68) by the loy in the mountainous districts of Ireland, where it is chiefly practised, is for stubbles about 10*s*, and for lea 12*s.* or 13*s.*; in these cases, however, the land is not all turned, the ridges or beds are generally narrow, that is, including furrows, about 6 feet wide, the furrow then is not stirred, but the edge of the bed turned down upon it as by the plough; indeed, this turning is a close imitation of ploughing at about 4 inches deep, and rates most commonly about the same price as ploughing would. For this purpose the loy in the hands of an Irishman is a most efficient instrument, it gives him a great lever power in raising and turning the sod; indeed, so well is it fitted for it, that I think a man with less fatigue would turn one half more ground in the day than he would with the spade. I had one in my hands a few minutes ago: its dimensions are, handle and blade, 5 feet 6 inches long, the blade 1½ foot long, and 3½ inches wide, and about ½ inch wider at its junction with the handle, the step 6 inches above the blade, and 6 inches higher is the fulcrum 5 inches deep; the blade fits on to the handle by a lapping of the sides for about 7 inches, and the handle is set into the blade in a double wedge form, side and lengthways. An Englishman could make no hand of this tool, and I do not consider it well adapted to general digging, although so used, but the narrow and strong blade fits it well for hard, stony land, and the broad, wooden step makes it easy to the foot; the weight of the blade is about 5 or 6 lbs., and the weight of the whole is about 10½ lbs. In 1850, when labour was still low, I dug (as No. 2) in the county of Longford 12 acres of strong clay land (locally called gollagh), mostly stubble, with the spade, forcing it into the ground nearly perpendicularly to 9 or 10 inches, but turning the sod over sideways, in the nature of a deep ploughing; the whole ground was dug, the men were employed at constant wages, work or no work, wet or dry, at 8*d.* a day; and in this way one acre with another cost me 1*l.* and a few pence. This might have been done for something less, either by task work, or by only paying the labourer for good working days, and for which plenty of labourers might have been got; but as a man must eat, though he might not be able to work, and as he would be better able to do a fair day's work when he did not fast on the day he could not work, I thought it only just and reasonable, as well as wise, to have him in attendance at all times, though at a little more nominal cost. *J. M. Goodiff, Scrabby, Co. Cavan.*

AN IRISH LOY.

The Winter and its Effects in Scotland.—I was anxious to learn from Mr. Graham, of Belstane, who grows Coniferæ largely, how a plant I had given him some years ago, of the Coniferous tribe, which I supposed might be an Athrotaxis, but which you suggested might be a Microcachrys on examining a sprig which I sent you, and the seeds of which I had received from South Australia, had withstood the recent severe frost. Mr. Graham writes me about that and some other of the numerous tribes of Coniferæ which he grows, as follows:—"I wrote to ask about the Microcachrys, and to-day (26th Feb.) have a report that it is as fresh as it was last summer. Greatest cold out there (*i.e.*, at Belstane, which is 800 feet above the sea) on the 15th inst., 3° above zero. Three other nights 8°, others 10° and upwards, so the trial has been pretty severe." Mr. Graham then notices the following:—Cupressus Goveniana, as unhurt; C. Lambertiana, ditto; Sequoia gigantea, ditto; Cryptomeria, ditto; Pinus insignis, all safe; Abies Menziesi, out of 300 only one injured; A. Douglasi, out of near 200 none injured; and all other Pines unscathed; all the above being in the open ground, without protection of any kind. At my place here, where I am, certainly favourably located as to climate, never having observed my outside thermometer lower than 17°, though it must have gone down lower during night sometimes, I have had about a dozen of Sikkim Rhododendrons out unininjured. Among these were: Rhododendron Falconeri, R. argenteum—a form of it at least—as if intermediate between the true R. argenteum, which is very scarce in Scotland, and R. Falconeri, but having the bud (like a small cone) of the true argenteum; R. Thomsoni, æruginosum, Wallichi, fulgens, niveum, glaucum, campylocarpum; and the following in a cold frame wholly unprotected by covering of any kind except the glazed sashes: R. Wighti, cinnabarinum, lancifolium, barbatum (several of which I had in the open border all uninjured); R. anthopogon (Hook. pl), &c. All these stood admirably. Besides these Rhododendrons I had other things of a more questionable character, which stood out all this severe season, viz.: Berberis, sp. at 10,000 to 11,000 feet on the Andes; Neillia thyrsiflora; Escallonia macrantha, foliage browned, but appears sound otherwise; Cerasus ilicifolia, slightly touched in the foliage, appears quite sound; Acacia, sp. from South Australia, scathed in foliage. The following in greenhouse or pots, often frozen as hard as bricks—Pourretia pyramidata, a bromeliacious plant from Andes of Quito, at 10,000 and 11,000 feet; Arabis species, with fine Fern-like foliage, at 13,000 feet on the Andes; Draba alyssoides, a shrubby species, at from 14,000 to 15,000 feet, on Andes; Cremolobus peruvianus at 12,000 feet, on Andes; Melastomaceæ, several species, at from 9000 to 11,000 feet, Andes; Ribes, species, at 13,000 feet, Andes; Margaricarpus setosus, at 10,000 feet, Andes—in open ground till middle of December; Berberis, dwarf species, at 14,000 feet on Pichincha, said to be very pretty; Alstromeria Caldasi, from 10,000 to 12,000 feet on Andes; besides many other things from the same elevations. *Isaac Anderson, Maryfield, near Edinburgh.*

Subterranean Application of Liquid Manure.—Since my return from the continent I have received several letters from gardeners informing me that a Mr. Wilkins had taken out a patent for my invention for growing Celery, and requesting me to inform the public of the number of years I have grown Celery, &c., on that system. In the year 1828 I used pipes for watering the interior of Melon and Cucumber pits and frames, and had excellent crops of Melons of large size and rich saccharine quality; in proof of which I took the first prize for Melons at the Doncaster Horticultural Society's Exhibition seven consecutive years, and was never beaten. If Mr. Wilkins will refer to the "Gardeners' Magazine" of 1829, he will find something said about my system of watering the interior of pits or frames. After being so successful with my pipes in conveying water to the roots of Melons and Cucumbers I employed the same system for supplying liquid manure to the roots of Celery and other horticultural produce with the same success, and I have continued it ever since. Surely, therefore, my using pipes for applying liquid manure to the subsoil under the roots of Celery, &c., for 26 years ought to convince Mr. Wilkins that his system is not novel; and I should like to know why Mr. Wilkins should wish to levy a toll from the public for that which is not his own. *James Stephens, 28 years' Gardener and Steward, Carr House, Doncaster, Yorkshire, March* 6.

Tepid Water for Watering Plants.—"Be sure you have some water in your houses for watering plants in winter," is a general cry with gardeners; and although it may be, and doubtless is, a good plan to adopt in the case of stove plants, it is quite unnecessary for those which usually occupy a greenhouse, *i. e.*, provided you have access to a well of any depth. During the late frost, I found by experiment that the temperature of the water from a well 16 feet in depth was 46° Fahr., while some water that had been standing all night on the flue of a greenhouse had a temperature of only 42°, the temperature of the greenhouse being 40°. This proves that even during the most severe weather the temperature of the earth undergoes but very little change, and I have seen it stated that the heat increases gradually the further we go below the surface, though I do not remember in what proportion. *A. A.*

The Late Frost.—The following observations were taken with a Six's thermometer, in exposed N. E. aspect, at 2 feet from the ground. The lowest points registered were:—Jan. 19th, 5°; 21st, 9°. Feb. 11th, 1°; 14th, 7°; 18th, 5°; 19th, 3°; 22d, 8°. The highest points registered were:—Jan. 24th, 36°; 25th, 36°; Feb. 3d, 36°; 5th, 39°. These returns are from Jan. 19th to Feb. 19th inclusive, the minima representing the lowest temperatures of the preceding nights. The following are the means for the same dates:

Mean.	Max.	Min.	Mean.	Lowest.
	29.78	17.28	23.53	1°

But the frost began some days before Jan. 19th, and I think an additional table or two is necessary. The first frost of any strength was on Jan. 11th, thermometer at

16°; from that till the 26th of February we had a frost every morning without a single exception, though on the mornings of Feb. 4 and 5 there was only 2° and 1° of frost respectively. Dividing the month of January, I find the following are the averages for the first 15 days: max., 30.8; min., 33.9. For the last 16 days: max., 29.8; min., 17.4. For the month of February: max., 30.69; min., 19.40. And from the 6th to the 22d of Feb. my thermometer never touched the freezing point at all. I attribute this rather to the exposure of the thermometer to the wind, as another on the ground close by indicated almost throughout the day the same temperatures, and in one or two instances, when the wind was high, two or three degrees warmer. All greens are destroyed, except Cabbages, Brussels Sprouts and Kale. *A. R., Bromley Common, Kent, March 7.*—The thermometers at Lilburn Tower, in the north of Northumberland, are fixed about 4 feet from the ground. The observations were taken at 9 A.M., and show the lowest temperature in the preceding 24 hours:—February 15th, + 5°; ditto 16th, — 7°; ditto 17th, — 9°; the mean of the maximum and minimum on the morning of the 17th was — 7°. We had frost and snow for seven weeks. Evergreens look as if they had been set fire to. Peach and Apricot trees appear to be destroyed; a handsome specimen Araucaria on our terrace, if not killed, is very much injured. *J. Deas.*—The following are the coldest nights that have occurred here during the late severe weather. The data are taken "from a registering thermometer in the middle of a garden, 3 feet from the ground:"—Feb. 10th, lowest, 8°; 13th, do., 9°; 14th, do., 9°; 15th, do., 11°; 16th, do., 9°; 17th, do., zero; 18th, do., 6°; 21st, do., 10°. We have had frost here, more or less, from Jan. 12th to Feb. 28th, or 48 days. Ice in small ponds was 12 inches thick. Vegetables have suffered very much, but, from present appearances, evergreens have not suffered near so much as in 1838. *D——, Amington Hall, near Tamworth, March 5.*—On Feb. 16, at 12 p.m., an ordinary thermometer here stood at 2°; on Saturday, the 17th, at 7½ a.m., it was 1° below zero, being 9° lower than in January, 1838, as registered by me in North Wales. Judging from present appearances, Wallflowers, Sweet Williams, &c., seem dead or dying. In the kitchen garden the Brassica tribe is much cut up. With a flue, the thermometer being 1° below zero, I was able to keep a heat of 65° in the Pine stove; having pot Grapes setting and swelling at the time, I was obliged to keep up a brisk temperature. *E., Gardener to J. E. Bealey, Esq., Hill House, Walsall, Staffordshire.*—The lowest night temperature at Oulton Park, Cheshire, I can state was as follows:—February 9th, 11°; 10th, 10°; 14th, 8½°; 15th, 12°; 16th, 7°; 17th, 6°; 18th, 11°; 19th, 14°; 20th, 10°; 21st, 8°. The register of Dixie placed against the north wall of the house 10 feet from the ground. *E.*

Yellow Raspberry.—This fruit, vulgarly called white Raspberry, is, I think, very generally preferred for its delicious flavour to the red. It also possesses one considerable advantage—that it is very little molested by birds, who evidently are not fond of it; and therefore it can dispense with nets in places where nothing else will protect the red fruit. But its produce seems to be very unsatisfactory; and it yields but scanty dishes even to the dessert table, while the red sorts are preserved by the bushel. Nor are the individual berries as generally filled out, rounded, and well-formed as the others. There is something defective about the plant. Can any of your correspondents inform me whether any artificial treatment, such as manuring or watering in the dry parts of the spring, will impart to this variety the luxuriance and productiveness of the red Raspberries? *A. H.*

Pregussata Fig.—In the select list of Figs which you give your correspondents, you often name Pregussata; Loudon I see does the same. I tried the sort for several years under glass, but it never even showed a fruit, and I gave it up in despair. Do others find it a good bearer? *S. B., March 5.*

Healing Paint for decayed Branches, or Snags, in Forest and other Trees.—Dissolve 2 oz. of corrosive sublimate in spirits of wine, and mix with 3 pints of best tar. The decayed parts to be pared off or gouged out below the level of the surrounding sound bark, and the wound well painted over with the above. All limbs that require removal should be cut off close to the trunk, or larger branch, and treated in the same way. *Wm. Collyns, M.R.C.S., Dreuxstrington.*

The Winter in Ireland.—The effects of the late frosts on some of the half hardy plants at Woodstock, near Inistioge, are as follows:—Eucalyptus perfoliata quite healthy, whilst E. obliqua is killed, and E. robusta very much injured. Correa rufa not at all injured; C. alba dead. Mimosa prostrata quite healthy at the west wall, dead at south wall. Acacia affinis very much injured; A. verticillata dead. Ceanothus divaricatus and azureus killed, C. rigidus and several others healthy. Spiræa Reevesiana killed, S. flore-pleno and all the others uninjured. Olea fragrans quite healthy at the west wall, killed at south wall. Colletia ferox slightly injured. Berberis empetrifolia and asiatica killed, B. dulcis and several other kinds not injured. It may be remarked that most of the above are established plants, being more than ten years planted. Amongst the exotic Coniferæ which stood well here may be mentioned Pinus Hartwegi, excelsa, apulcensis, and devoniana. Cunninghamia sinensis looks remarkably well. Cupressus Lambertiana and macrocarpa could not be more healthy; C. lusitanica (Goa Cedar, 50 years old), greatly injured; whilst C. Goveniana in an exposed situation, in flower and full of cones, not the least injured. Juniperus bermudiana, browned other seasons, quite green and healthy now. Cryptomeria japonica, 20 feet high, never looked better. Araucaria imbricata, 30 feet high, in rude health. Abies morinda and Douglasi, as well as Picea Webbiana and Pinus insignis, it is well to know, will stand the lowest temperature. *March 1.*

Grafted Rhododendrons and Hardiness of Hybrids.—The discussion now going on in your columns as to the merits or demerits of grafted Rhododendrons will not fail to elicit some useful facts concerning that valuable plant, which I think might justly be called the most ornamental hardy evergreen shrub we possess, and therefore deserving of having everything said about it which is in any way likely to facilitate its general culture. I have had some experience among Rhododendrons, which leads me to differ from "J. R.'s" assumption that grafting is necessarily a dwarfing process. Many seedling plants of R. ponticum will grow quite as strongly as any hybrid that has ever come under my notice, and if such stocks are chosen for grafting upon, and that operation be skilfully performed, there can be no reason why a plant resulting from such an union should be less robust than another of the same variety raised from a layer; I must admit, however, that I have never seen any hybrids possessing that laurel-like luxuriance described by "J. R." As regards another point in dispute, as to whether the hardihood of a hybrid is determined by the male or the female parent, I agree with "J. R." and the authorities he quotes, that the male exercises the strongest influence in this matter upon the offspring; but as my opinion is founded upon the following single experiment, it may not be worth much. Some eight or ten years ago a plant of R. arboreum grew in the border of a conservatory here, and yet notwithstanding its favourable situation, it refused to produce its magnificent flowers oftener than once in two years. On one occasion I fertilised some of its blossoms with pollen from common hardy kinds which had been forced into early bloom, and plants the produce of this cross have been growing out in the common soil of the pleasure-ground ever since, some of them being now from 5 to 6 feet high, and as much through; consequently they are perfectly hardy. In habit and appearance they differ altogether from arboreum, being dense spreading bushes, with nothing tree-like about them. One peculiarity of the female parent, its shy blooming, has however been inherited by the offspring, for some of these large bushes have never yet produced a single flower; others have flowered sparingly, the colour in all cases being some shade of crimson. I have also raised some very distinct varieties by crossing alta-clerense and other red hybrids with the common sorts of ponticum and catawbiense. These commence blooming after their female parents, coming out in succession till the common kinds begin to open, and thus stopping a gap in the flowering season of Rhododendrons; they have also the desirable properties of bright and various colours, and a compact dwarf habit, but the value of them is unfortunately lessened by their liability to disfigurement by late spring frosts. A new class of late-blooming, high-coloured kinds, not liable to this last objection, is now in the hands of the principal growers, but being at present high in price, these are not much known to general cultivators. It would help to make them more so if Messrs. Standish and Noble would favour our readers with the names and colours of the best and most distinct of them. Hybrids raised from seeds of R. campanulatum, I find, inherit in a striking degree its peculiarities. In foliage and manner of growth there is a strong family likeness between that species and my seedlings from it, and unfortunately they promise to be quite as shy as the mother in producing flowers. Judging from what we know of the Indian species, it is to be feared that none of the large growing kinds from that country will be free bloomers. *J. B. W.*

Societies.

Horticultural, *March 6.*—J. M. Strachan, Esq., in the chair. The Hon. Lord Murray, J. Boord, Esq., and Mr. Videon were elected Fellows. Notwithstanding the very severe weather we have lately experienced, there was an excellent exhibition on this occasion, not only of plants and fruits, but also of forced vegetables. Of Forced Bulbs there were some charming collections, chiefly of Hyacinths; of these the best came from Mr. Davies, gr. to E. Rosher, Esq., of Hamilton Terrace, St. John's Wood. The most striking varieties contained in it were Laurens Koster, Charles Dickens, Nimrod, Sutton's Favourite, and Queen Victoria. Mr. Cutbush, of Highgate, furnished a group in which were two some particularly worthy of notice; they were William the First, a very deep bluish purple with a large compact head of single flowers, and Baron Rothschild, a bright red, and also single. Mr. Todman, gr. to Mrs. Buckmaster, contributed a mixed collection of bulbs, consisting of Tournesol Tulips, Jonquils, Lachenalias, and four kinds of Hyacinths. Cyclamens were furnished by Messrs. E. G. Henderson, of the Wellington Road Nursery, and Mr. Myatt, of Deptford. The latter sent C. persicum; the former red, white, rose and flesh coloured varieties of that kind, together with the dwarf and pretty C. Atkinsi, a comparatively new hybrid raised by Mr. Atkins, of Painswick, from seed of C. coum crossed with persicum. Cinerarias were confined to one collection, which was contributed by Mr. Todman. The most striking varieties were Beauty of Clapham, Queen, and Delight. The last named exhibitor also showed finely flowered medium sized plants of Indian Azaleas, consisting of Præstans, Trotteriana, a variety in the way of lateritia, and purpurea elegans. Mr. Fleming again showed a plant of his purple striped and mottled white seedling called Duchess of Sutherland.

Among Orchids were some noble specimens. Of these the most remarkable was Dendrobium speciosum, a large plant well furnished with flower spikes, from Messrs. Rollisson, of Tooting. This was unfortunately, however, the spotless variety of it, which is not nearly so handsome as the other. It was stated that the magnificent plant of this Dendrobe which the Society is well known to possess, is now in full flower in the garden at Chiswick, but that owing to its great size it could not be got out of the door of the house in which it is growing to bring to the meeting. The other Orchids in Messrs. Rollisson's collection were the White Butterfly plant (Phalænopsis amabilis), the ivory white flowered Cymbidium eburneum, Schomburgkia violacea, Vanda tricolor, and a handsome variety of Dendrobium nobile called pulcherrimum. Messrs. Veitch sent the singular-looking Lady's Slipper, Cypripedium villosum, so called on account of the long hairs with which the flowers are furnished. Mr. Forsyth, gr. to Baron Rothschild, had a well flowered Phaius grandifolius, and a large and fine Dendrobium nobile came from Mr. Hammerton, gr. to J. Lovick, Esq., of Stamford Hill. Flowers of Mormodes igneum and of two Vandas were contributed by Mr. Pass, gr. to T. Brocklehurst, Esq., of the Fence, Macclesfield.

Of Stove and Greenhouse plants there were several. Mr. Davies, gr. to E. Rosher, Esq., showed Franciscea confertiflora, certainly the most ornamental of the genus. A plant of this and another species of Franciscea were also exhibited by Messrs. Veitch, who showed, moreover, a charmingly blossomed specimen of the Jasmine-flowered Rhododendron, pronounced by many to be the gem of the exhibition; also a fragrant white flowered Posoqueria, and some of the better kinds of Epacrises. Messrs. Lee had well grown plants of Styphelia tubiflora, Eriostemon linifolium, Imatophyllum miniatum; an Epacris and a Camellia. Mr. Todman sent Eriostemon myoporoides, and from Messrs. Henderson, of Pine Apple Place, came Hebeclinium ianthemum, in the shape of a handsome bush covered with blue Ageratum-like flowers, a Begonia, some Acacias, and other plants.

A small boxful of Neapolitan Violets was shown by Mr. Boyd, gr. to Viscount Dillon, at Dytchley Park, Oxon.

Of Chinese Primroses there were four collections, all of them good specimens, and well flowered. They came from Mr. Smith, gr. to Mrs. Reay, of Wanstead; Mr. Chilman, gr. to Mrs. Smith, of Epsom; Mr. Green, gr. to Sir E. Antrobus; and Messrs. Henderson, of Wellington Road. Mr. Hayes, of Edmonton, had a pretty blush kind called Bride, whose blooms measured 1¾ inch across. A good specimen of Double White was shown by Mr. Keele, gr. to J. Butler, Esq., of Woolwich.

Some good Pine Apples were produced. Mr. Fleming sent from Trentham two fruit of the smooth-leaved Cayenne; one a little too far gone, weighing 5 lbs. 4 oz., the other 4 lbs. 12 oz. From Mr. Davies, gr. to Lady Bridport, came a Black Prince, finely shaped, weighing 6 lbs. 4 oz., and a smooth-leaved Cayenne, weighing 4 lbs. 3 oz. These were stated to be both from old stools; one of which (the Cayenne) yielded in July last a fruit 6½ lbs. weight, and the other (the Black Prince) one in August last 10 lbs. in weight. Mr. Dodds, gr. to Colonel Baker, showed a smooth-leaved Cayenne, weighing 4 lbs. Mr. M'Ewen, gr. to the Duke of Norfolk, sent both smooth and prickly leaved Cayennes, the former weighing 2 lbs. 5 oz., and the latter 3 lbs. 10 oz. Mr. Page, gr. to W. Leaf, Esq., had a Providence, weighing 4 lbs. 15 oz.; and Messrs. Bray and Henderson had each a Queen, weighing respectively 3 lbs. 1 oz.

New Grapes, quite ripe and beautifully coloured, came from Mr. Forbes, gr. to the Duke of Bedford, at Woburn; and Mr. Jennings, gr. to the Earl of Derby, at Knowsley. These both consisted of Black Hamburgh.

Pears, unrivalled for their beauty and freshness thus late in the season, were shown by Mr. Tillyard, gr. to the Right Hon. the Speaker. Fine examples of this kind of fruit were also furnished by Mr. Snow, gr. to Earl de Grey; Mr. Robertson, gr. to Lady Emily Foley; and Mr. Smith, gr. to Mrs. Reay. Among the varieties shown were Easter Beurré, Beurré Rance, Ne Plus Meuris, Knight's Monarch, Glou Morceau, Old Colmar, Winter Crassane, Chaumontel, Beurré de la Motte, Catillac, and large and fine specimens of Uvedale's St. Germain. The latter came from Mr. Snow.

A most beautiful collection of Apples was shown by

Mr. Snow, their skins being bright and clear without the slightest symptoms of shrivelling. Among them were Blenheim Pippin, Golden Noble, a large pale yellow Apple, Bull's Golden Reinette, Kirk's ditto, Court Pendu Plat, Robinson's Pippin, Bedfordshire Foundling, Selene (reported to be a useful Apple), Old Golden Pippin (from an east wall), Scarlet Nonpareil, and one or two others. Mr. McEwen also sent a trayful of well-preserved varieties of Apples from the Duke of Norfolk's garden at Arundel.

Strawberries were exhibited but they were not good. Mr. M'Ewen sent Black Prince and Keens' Seedling; and Mr. Brown, of Waltham Abbey, the last named variety.

Forced Vegetables, considering the bad weather we have had for such things, were very satisfactory: Mr. M'Ewen produced examples of Mitchell's Royal Albert Rhubarb, Fulmer's Early Kidney Bean, Asparagus, Potatoes (very small), Seakale, and Mushrooms. Mr. Fleming sent from Trentham Rhubarb, Kidney Beans, Seakale, leaves of Silver Beet, a brace of good Cucumbers, and some Mushrooms.

Of Salad Vegetables, Mr. Tillyard sent Beck's short-topped Radish, Celery, Batavian and green-curled Endive, Mustard and Cress, and a brace of Sion House Cucumbers. Mr. Fleming had Lettuces, blanched Chicory leaves, Celery, Beet, Mustard and Cress, and Cucumbers, the latter a long kind, a hybrid from a White spine crossed with Sion House. Mr. M'Ewen produced Lettuces, Endive, Celery, young Onions, Mustard and Cress, and Sion House Cucumber. Some Cucumbers, Mushrooms, and Asparagus, were also exhibited by Mr. Taylor, gr. to J. Coster, Esq., and Mr. Tivey, gr. to J. H. Elwes, Esq., of Cheltenham. Of French produce, Mr. Lewis Solomon, of Covent Garden, showed Lettuces, Endive, Globe Artichokes, very large, White Asparagus, and Green "Sprue," and Barbe du Capucin.

Variegated Scotch Kail was contributed by Mr. Fleming, in order to show how well it had withstood the severity of the winter. It was stated that the frost had had no effect on it whatever, while it had left nearly all other winter Coleworts quite blanched. The variety in question is red coloured, and is much grown in the Highlands of Scotland, where it is called Cow Kail. It is, however, a good garden vegetable, especially in severe winters.

Among Miscellaneous Articles was a new kind of hoe from Mr. Wood, gr. to C. R. Scott Murray, Esq. It may be described as a common draw hoe with a pick in the centre of the hoe about 6 inches or so long. It may thus be said to be a combination of the Vernon and common draw hoe. It was stated to be a useful implement both for stirring the ground and killing weeds.

A very pretty Basket made of wicker, and covered on the outside with leather stamped so as to resemble leaves and fruit, and also a smaller basket covered with leather leaves, were exhibited. These are intended for setting pot plants in in sitting rooms, and are doubtless well adapted for the purpose, being much more ornamental than a bare garden pot. They are made by Mrs. Compton, of Blackheath Hill.

Three Watering Pots made of zinc were shown by Mr. T. B. Lawrence. A model and plan of a Hot-water Pipe were produced by Mr. Munro, gr. to Mrs. Oddie; they were intended to show that by pressing, as it were, a 4-inch circular pipe into a kind of square, with deep indentations in its sides, it would still have as much heating surface as a round 4-inch pipe, and at the same time require less water. How this kind of pipe may answer can only be determined by experiment.

Samples of Vegetables preserved by Messrs. Chollet & Co., of Paris, under Masson's patent, were exhibited; a full account of these will be found in another page.

An extensive and valuable assortment of Fibrous Materials: Cordage and Paper prepared from them was furnished by the secretary of the Society, Dr. Royle. Among them were Plantain fibre and tow, plain and dyed, showing that it takes colour well; also fibre from Yuccas, Pitu or Agave (Madras), Sanseviera or Moorva, Moonja (Saccharum Munja), a kind of Sugar Cane, Pine Apple, and Jute (Corchorus olitorius). There were likewise leaves of Bhabhur (Eriophorum cannabinum), and Cyperus (C. tegetum), together with examples of a kind of Bark-cloth from the Paper Mulberry and Flam tree of Borneo. These natural cloths and fibres, together with the papers made from Lace-bark, Plaintain, &c., excited, as might be expected, much interest, showing, as they did, the richness of our Indian empire in textile materials, which are at present so scarce with us. They were sent partly to show the great numbers which we have in India, and of which paper is made in the far East; in opposition to some here, who say paper cannot be well made from fibres, but that you require a *woven* fabric. Another object was to show that you need not take the trouble of separating the fibres individually, but that the Chinese, &c., strip off the bark of the Paper Mulberry and pound it into half stuff, and water it down into pulp; so in the Himalayas do they treat the Daphne, of which enormous sheets of tough paper are made, and which, when carefully made, will take the finest impressions, as the so-called Indian paper for proofs. They strip off the bark of species of Mulberry, Artocarpus, &c., which we know grow large and quickly and are abundant, and pound the bark into half stuff; so with many other trees now yielding bast, bark, cloth, &c. In India, moreover, they make paper from endogenous fibres, as of Agave, Sanseviera, and Plantain. The latter of every variety of quality; that is, both thick for drawing paper, and tough for packing paper: and here it has been made fine enough for the Queen's note paper. In India, they also make paper from the so-called Hemps and Jute, as well as from Cotton; that is, from species of Corchorus, Crotalaria, Hibiscus, and Gossypium: thus they can show an abundant, never-failing source of supply of cheap materials. The basts made into rope even sell on the Arracan coast for about 3*s.* a cwt.; Jute and Sunn are sold in the state of fibre from 3*s.* to 5*s.* a cwt. Why may not other fibres be produced as cheaply on such coasts as those of Malabar and the Malayan peninsula, or the luxuriant and well-watered Bengal? Mr. Henley, quoted in Dr. Royle's new work, where all these things are fully detailed, states that good half stuff may be landed in London at from 13*l.* to 16*l.* per ton; the latter equal to that from good linen rags, from which there would be little loss in preparation, and which would, moreover, be useful for "filling up." Samples of paper prepared from Holcus saccharatus were also exhibited from Mr. Henderson, of Kingskerswell. They were strong, and of tolerably good colour. It was mentioned that fibre of this plant was some time ago submitted to the Treasury for the purpose of instituting experiments with it, in order to ascertain its value, and that the result of the Government investigations was, that it was inferior in strength to Hemp, but very nearly as strong as Flax.

Among plants from the garden of the Society, the most remarkable was Thyrsacanthus rutilans, a scarlet-flowered stove plant, of which some account was given last week. There were also cut flowers of Chimonanthus, from plants on the conservative wall, protected only by mats, which have had the effect of preserving them perfectly from the frost.

Cuttings of four kinds of new Pears were distributed to such Fellows as wished to receive them.

The Medals, &c., awarded on this occasion, will be found in our advertising columns.

Notices of Books.

The Book of the Garden. By Charles M'Intosh. Blackwood. Edinburgh and London. 2 vols. 8vo. 4*l.* 7*s.* 6*d.*

Every one interested in gardening or who has devoted any portion of time either to the perusal of its literature or to the pursuit of it as a delightful and intellectual occupation, must have noted the extraordinary and almost incredible strides which have marked its progress during the last 30 years. It is the purpose of the work before us to describe that progress. Thirty years since little inroad had been made upon the ancient principles of its architecture or its every-day operations; hence, any innovation upon long established practices was received with suspicion and distrust. To have erected a greenhouse upon any other plan than with front sashes, like a pastrycook's shop, and a semi-opaque roof, would have been considered absurd. Houses for the production of fruits had also one stereotyped plan, viz., the lean-to. The timbers employed were such as are used in the construction of cathedrals; the glass, the dingiest that could be found, with small squares, half of them lap, and usually embedded in putty. These principles we modern innovators presume were adopted to keep in heat and shut out light, and yet our author says,* "Improvements in hothouse building appear to bear no comparison with the improvements that have taken place of late years in other departments of horticulture." We think it must, however, be admitted that progress has been made in the "structural" department of gardening. Sir George M'Kenzie and the late Thomas Andrew Knight were among the first to dispel the cloud that hung over us, and let in the rays of light. Mr. Loudon, by means of his numerous publications, helped to enlist and enlighten the public mind. Then came forward Sir Joseph Paxton, who produced the great conservatory at Chatsworth (at that time unequalled as a glass structure) on a new principle termed "the ridge and furrow." This has been followed by the Crystal Palace at Sydenham, which a celebrated writer terms, and justly, "the eighth wonder of the world." We cannot, therefore, at all agree with our author in his opinion on the progress of "structural" gardening, and in support of our case we appeal to plates 6 and 7, which illustrate his own designs at Poltalloch and also at Panmure, where he has succeeded in producing a new system of arrangement and ventilation of an admirable description.

For the construction of garden walls Mr. M'Intosh has given various plans; but we are glad to find that when built of brick he approves of and adopts hollow walls, which are equally strong as solid ones, and less expensive, the cavity within containing a large body of air, which from its nonconductive properties renders them drier and warmer; and he adds,† "to ensure durability all walls when first built ought to be furnished with either cast-iron eyed or headed nails pushed into the joints before the mortar or cement is set, 9 inches as a minimum and 15 inches the maximum distance apart. To these the trees should be secured by soft twine previously steeped in pyroligneous ether. This will not only be found an immense saving of material ever after, but will secure the wall against those annual defacements which arise from driving in and pulling out thousands of nails both in joints and in the bricks." In this excellent advice we entirely concur, for what can be more unsightly than a garden wall freckled all over as if it had had an attack of the small pox, affording thousands of hiding places for insects, and ornamented with the fragments of the tailor's shop.

The subject of heating is elaborately treated and discussed. Every kind of appliance, from the Dutch stove down to the most recent invention, is described and illustrated, showing clearly the improvements that have progressively taken place up to the present time. For ourselves we consider that little, if any advance has been made, either theoretically or practically, in heating appliances for horticultural purposes during the last 20 years.

As regards ventilation, however, we entertain a very different opinion. Recent experiments have shown that many of the really magnificent structures, especially of iron, were defective in this particular. Some plants existed in them, others died, but none luxuriated as they ought to have done under the amount of light which they received. This, as was afterwards discovered, arose from defective ventilation, a subject which is treated of fully in "The Book of the Garden," and we would strongly recommend every person, especially garden architects and gardeners themselves, to peruse and thoroughly comprehend it, for in this lies the very soul and success of plant culture. Perfect ventilation is as essential to the full and perfect development of plants as healthy lungs are to the vigorous expansion of the human body.

In the construction of every kind of building required in a garden, the "structural" section of the work will be found to contain a large amount of information suitable alike for buildings and gardens. Mr. M'Intosh being himself one of the most experienced garden architects of our time, minute details are given, so that the expense of even a pit, up to a garden replete with every necessary erection, may be at once ascertained, a matter of no small importance to gentlemen about either to form new gardens or improve such as already exist. The details are copious and exact, and the estimates, as far as these can be given, owing to the fluctuation of prices of labour and materials in different parts of the country, are such as may be relied upon as a close approximation to accuracy.

We shall conclude our notice of the first volume of this work, which is devoted to structural gardening, matter wholly different from that contained in the second volume, with a few observations on the execution of the work before us. It contains nearly 800 pages and about 1100 illustrations, and it will, we think, be admitted that artistically no former work on gardening has yet equalled it; the engravings are selected from the best subjects, such as the Royal Gardens, Frogmore, Royal Botanic Garden, Kew, Syon House, Chiswick House, Holland House, Dalkeith Palace, &c., &c., besides some excellent examples of flower gardens. The coloured plates deserve the attentive consideration of the young gardener, exhibiting as they do the principles by which the various colours to produce harmonious effect are arranged. On the whole, this volume on structural gardening, both in compilation and artistical execution, deserves our warmest commendation.

The second volume of this work is of a cultural character, and has been got up with great care and research. It embodies the opinions and practice of the older writers on Horticulture, and also what is of more importance, the experience of our eminent modern gardeners on the subject, together with the opinions of our author, who has studied and practised the art for upwards of half a century, both in this country and on the Continent. If we were called upon to show the value such a book possesses when in the hands of a gentleman or his gardener, we might point to page 10 of the volume under notice, where Mr. M'Intosh gives the quantities of seeds necessary for a kitchen garden of an acre. How such quantities may agree with those recommended by our advertising friends, we know not; we should, however, feel ourselves safe in being guided by the great experience of our author in a matter of this kind. With regard to the varieties of seeds, which are now becoming a nuisance, and a puzzle to every possessor of a garden, Mr. M'Intosh's book will be found a good guide, pointing out as it does the best kinds to form a selection, a matter which every one must admit to be most important. The same in fact may be said in respect to fruit trees. The cumbrous lists which are issued from the various nursery establishments, both in this country and on the Continent, are enough to perplex and confuse our very best cultivators. "The Book of the Garden" will relieve us of much of this difficulty. It will also place before the reading gardener—and who are not reading gardeners now-a-days?—the principles of the art explained and discussed in a manner diffuse and instructive. Such plants as are introduced, whether tree, shrub, herb, or vegetable, are fully described, both as to culture and use, and we doubt whether in any other work the enemies of gardeners have been more fully illustrated. The insects which inflict an injury on vegetation are not overlooked, and the readiest means of their destruction pointed out. We therefore feel justified in recommending Mr. M'Intosh's two excellent volumes to the notice of the public.

* Vol. I., page 108. † Vol. I., page 106.

FLORICULTURE.

The Hollyhock.—This is now becoming a favourite both in the gardens of the rich and poor. It is a plant of easy culture, and may be propagated either by seed division of the roots, or by cuttings. The seed should be gathered from the best coloured double varieties, and when cleaned from the husk it should be stored in a dry

situation until March or April, when it should be sown broadcast, either on a gentle hotbed or on a warm sheltered border prepared for the purpose. As soon as the young seedlings will bear handling they should be transplanted into a rich soil in rows 2 feet apart, and the plants should stand 1 foot asunder in the rows, in order that they may not be spoiled by being too crowded. The following season they will bloom, when a selection should be made, and all the best varieties marked; such as are finely shaped and brightly coloured should be cut down, and planted where they are to remain and bloom; the others may be thrown away. Fine varieties are readily increased and perpetuated by division: good strong plants with plenty of shoots may be taken up when they have done blooming, and divided either with a spade or a sharp knife, taking care that each part has a good supply of roots, and then they may be planted where they are to remain and bloom. When they are propagated by cuttings they should be made from the laterals or side shoots which push from the base of the main stems. When the cuttings are prepared they should be planted round the edge of pots, filled with a compost of sandy loam, pressing the earth close to each cutting as you proceed. At first the pots should be placed in artificial heat, keeping the lights close down, and allowing very little air until the cuttings have taken root. They should not be allowed much water, as they are liable to damp off, and should be securely shaded from the scorching heat of the sun. When they have emitted roots they should be potted off into small pots, and then placed in a shady situation, where they may receive regular supplies of water, and be gradually inured to bear the full force of the sun. They will then be ready for planting out, which may be done early in September, by which means they will get established before winter. Early in spring, when they begin to grow, they should have strong tall stakes placed to them, the size of the stake corresponding with the strength of the plant. As they advance in growth the shoots should be regularly tied to the stakes, and during dry weather a dose of liquid manure water would be useful. When the blooming season is over and the seed gathered, where seed is required the old flower stems should be cut down. Dig the ground among the plants, and give them a good quantity of rotten manure. To some this attention may appear tedious, but it will be amply repaid; for, as a back row plant extending along a flower border, or intermixed with Dahlias, the Hollyhock stands unrivalled. *F. S.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The large amount of fire heat which has been necessary in all plant houses this season will have been very favourable to the increase of red spider, and this pest should be carefully looked for upon any plant likely to be infested with it. Plants that may have occasionally been allowed to get too dry at the root, and those standing near the pipes or heat giving surface, or such as may be in a weakly state, are likely to be attacked first, and all such should be very minutely examined, and if they are found to be at all infested with this enemy, lay them upon their sides on a clean mat, and give them a thorough washing with the syringe or engine, using tepid water, and taking care not to injure the foliage by dashing the water against it too strongly. If taken in time, red spider is very easily eradicated, but if once allowed to get thoroughly established, it is the most destructive insect with which we have to contend, and perhaps the most difficult to eradicate. Recently potted plants will require to be very carefully supplied with water until they get into free growth, for although they will not require a very liberal supply, any neglect, or oversight, will be more likely to be injurious to such than in the case of plants that have not been recently shifted. If the well-known rule, "never water a plant until the pot rings clear, and then give it a thorough soaking," was regularly observed by persons entrusted with this work, plant growing would be an easier and simpler matter than it has hitherto proved, save in the hands of those who respect this good old advice. Things that have been lately repotted should be kept as much together as circumstances will allow, affording them a rather humid atmosphere, syringing them lightly early on the afternoons of fine days, and keeping them rather close. Lucullas in pots should be encouraged to make their growth, in order to get the wood well matured early in autumn, so as to have them in flower before those planted out; for it is desirable to lengthen the blooming season of these splendid plants as much as possible. Should we be favoured with bright weather, shading will soon be necessary for show-houses that are much exposed to the sun, and also for some of the Orchids. At all events, see that it is ready for being put up, so that it may be fixed at any time when it is deemed advisable to do so, but it should be dispensed with as long as can be safely done. Young stock of all kinds should now be encouraged by every possible means to make vigorous growth, especially Fuchsias; for these will soon be more disposed to bloom than make wood. See that they do not suffer for want of pot room, and keep them near the glass to induce a close habit with strong short-jointed wood. Stove.—Use every means to secure a moist atmosphere here, and shut up early on fine days after giving the plants a gentle syringing. Encourge the growth of Clerodendrons and other gross feeders by giving weak liquid manure water to such as may have filled their pots with roots. Pot off Achimenes before they get so strong as to be likely to suffer by the operation. Look sharply after insects here, particularly mealy bug, which, wherever it exists, will be escaping from its winter quarters, and unless destroyed with a diligent hand will soon spread and become very troublesome.

FORCING DEPARTMENT.

Pineries.—The increased amount of sunshine which we are now experiencing will be highly beneficial to these, especially to plants swelling their fruit. Give these as much tepid manure water as the soil will bear without becoming too wet, and afford them a thoroughly moist atmosphere with a warm temperature; but obtain this as far as possible by economising the solar heat, giving air sparingly when the glass rises towards 80° or 85°, but do this by opening the ventilators on the sheltered side of the house, so as to avoid currents of dry air blowing through the house, and robbing the atmosphere of its moisture, and shut up early in the afternoon. Do not hurry young stock, but aim at obtaining a stocky habit, and proportion the temperature to the state of the plants and the amount of light. Do not exceed 60° or 65° by night, and give a little air when the glass rises to 75°, but with a moderate circulation of air, 85° by sunshine will not be too high. See that all is right at the root, for the sun will soon tell upon badly rooted plants, discolouring the leaves, &c. Aim at keeping the soil light and open, and in a nice healthy state as to moisture, and do not syringe heavily, but give the soil a liberal soaking whenever it may be necessary, using the syringe merely to moisten the plants on the afternoons of bright days, or after much fire heat has been used. Vineries.—As the berries swell in the early house it will be readily perceived whether the bunches have been sufficiently thinned; and such as may appear to have been left too thick should be gone over a second time at once, for it is folly to allow the energies of the Vine to be wasted upon fruit that is not to be left to come to perfection. Also reduce the number of bunches on Vines that appear to be overcropped, for with the most favourable seasons there is no chance of securing first-rate fruit from Vines that are allowed to carry too heavy a crop; and overcropping is, moreover, injurious to the Vines and to future prospects; keep the night temperature at about 65° where the fruit is swelling, and use no more fire-heat than may be indispensable to secure this, shutting up early and economising the sun's influences as much as possible. Also keep up a moist atmosphere until the fruit begins to change colour, giving air very cautiously, especially on stormy gloomy days. Attend to stopping laterals, &c., and keep everything trim and orderly. Peaches.—Keep the young shoots regularly and neatly tied in so as to admit all the light and air possible to the foliage, and give the trees a good washing with the syringe or engine on the afternoons of fine days, to prevent red spider making its appearance. If green-fly makes its appearance, which often happens when the weather has not admitted of giving air freely, or where the trees are at all unhealthy from any cause fumigate, and if mildew makes its appearance dust the affected parts with sulphur immediately it is perceived. Be careful not to push succession houses too fast, and secure a moist state of the atmosphere, using the syringe freely except where the trees are in bloom.

FLOWER GARDEN AND SHRUBBERIES.

Now that the ground is in a fit state for work, and the weather favourable, every possible exertion should be made to get alterations completed, for planting cannot be done too soon after this season, and if drying winds should set in watering will be necessary in the case of shrubs of any size that have not been long enough removed to have made a few fresh roots. Also attend to having everything well secured against wind, for nothing is more injurious to plants than allowing them to be rocked about by the wind, loosening and breaking their roots. Bourbon, Tea, and other tender Roses may now be pruned, and the beds manured and lightly forked. Roses do not object however, to a rather firm soil, and the roots should not be injured by forking or digging too deeply. The best manure for these, after they get fairly established, is diluted night soil, which should be applied after loosening the surface soil, and an inch or two of fresh soil sprinkled over the surface to prevent any unpleasant smell, &c. In the case of plants growing in badly-drained heavy soils, a good coat of well decayed farmyard manure will be more suitable, and will assist in keeping the ground moderately open. Get walks, &c., edged, and keep gravel and lawns well rolled. Also see that a sufficient quantity of plants for bedding out is in a fair way to be ready when wanted in May. Sow seeds of tender annuals on a gentle hot-bed, where they can be freely exposed to air when up, to keep them stocky. Hardy annuals for early blooming may also be sown in the borders.

HARDY FRUIT AND KITCHEN GARDEN.

Where any nailing remains undone every advantage should be taken of fine days to get this finished. Also be prepared with covering for Apricots, Peaches, &c., for the season is far advanced, and with bright warm days the blossoms will soon make their appearance. And wherever it can be done the covering should be put up at once to shade the trees, and retard their blooming as much as possible. Directly the nailing is finished the borders should be forked or lightly dug over, so as to give the ground a fresh neat appearance. Peas, Lettuce, and Cauliflowers that have been raised or wintered under glass should, save on frosty nights, be fully exposed to the air, so as to have them fit for planting out whenever the weather becomes such that they can be safely trusted; but it will be wise to keep all such things under the shelter of glass until the nights become warmer than they have lately been. Meantime, see that the ground for the reception of these is prepared, choosing a warm sheltered corner, and for Lettuce and Cauliflowers it can hardly be made too rich. The main crop of Potatoes should be planted at once; Onions and Parsnips should also be sown immediately, if not already done. Make a small sowing of Savoys, Brussels Sprouts, German Greens, Snow's and Early Sprouting Broccoli, and Leeks, and see to providing a succession of Lettuce, Radish, and other small salads, by frequent sowings.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the week ending March 8, 1855, as observed at the Horticultural Gardens

Satur.	17	49.7	33.0	41.4	12	0.36	0	6	3	—	3	5	[illegible]	[illegible]

The highest temperature during the above period occurred on the 16th, 1828, and 17th, 1841—therm. 67 deg.; and the lowest on the 13th, 1837—therm. 13 deg.

Notices to Correspondents.

Barked Apple Trees: *G B.* We would advise you to give one the worst of them a trial. Apply to the wounds cow-dung mixed with clay and wood ashes, and tempered with water till of the consistence of thick paint.

Bedding Plants: *J Rogers* will be obliged by some of our correspondents informing him whether Whitlavia grandiflora, Escholtzia tenuifolia, and Leptosiphon aureum are really good bedding plants.

Cabbage: *Lady Farmer.* The "Thousand Heads" mentioned at p. 112 of Soyer's "Shilling Cookery," is Chou a mille tête, or Cow Cabbage.

Drainage: *S J W L.* A four feet drainage will do very well. The bore of the pipes is immaterial; take the size that the farmers use, and which you can most readily procure. Good 1½-inch pipes with collars will suffice, but you will probably find a larger size more procurable. Nothing is gained by a large bore.

Early Peas: *L M N.* It is doubtless a good plan to shelter early Peas when growing by placing a hedge of matting or of plaited Bean stalks or other protection between the rows, where they are much exposed to cold winds, provided the protection does not shade the plants too much.‡

Elm: *W M.* Remove the soil at Midsummer, not now.

Epacrises: *Yorkshire.* You will find the treatment of these fully given in an article by "Alpha" in our vol. for 1853, p. 67.‡

Forcing: *J R.* We really could do nothing with it. Such subjects are very difficult to manage.

Greenhouses: *Amateur Gardener.* The real objection to iron is that it is too expensive, except for large buildings. Gas may be used for heating, *provided*—1, it cannot escape into the house and 2, its drying action is counteracted by a sufficient evaporating surface.

Hartley's Rough Plate Glass: *J Q B.* It will suit your orchard house perfectly.‡

Heating: *R S.* You know as much as we do, and must judge for yourself.

Lettuces: *Old Sub.* They are blanched by tying up the outer leaves over the inner ones so as to exclude the latter as much as possible from light. They should not, however, be tied up when wet or they are apt to rot in the heart.‡

Mulberry Trees: *Silkworm.* The white Mulberry trees you speak of were bought for a company formed to grow silk in Ireland. It failed, and all the plants disappeared long ago. The speculation would not pay.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 1137, Anemone Bungeana; 1173, Hypericum crispum; 224, H. empetrifolium; [illegible] Fumaria pallida; 78, Ranunculus arvensis; 322, R. Kotschyi; 1234, R. flammula (?) var.; 2, Ceratocephalus falcatus.—[illegible] Yes; but it is not specifically distinct from Asplenium adiantum-nigrum. *S.*

Nut Bushes: *Amateur.* You will find some remarks on pruning and training these in another column of to-day's paper.‡

South Devon Grass: *J P.* Don't you think a mild damp climate an ample explanation of the circumstance you mention? It is the Continental summer that renders green turf unattainable. The sort of Grass has nothing to do with it.

Strawberries: *S B.* Do not remove the axillary crowns. They remove nothing, and add much.

Susquehanna Root: *J B D.* We can find no one who knows what this is; but inquiries are making, of which you shall know the result.

Tools: *Stanton.* We do not think you *can* buy in London a genuine American axe.

Weeds: *X Y Z.* If you don't mind colour, the readiest way of keeping them down is to "pay" the walks with gas lime. Boiling salt water also is effectual, but no "chemical substance" can be advantageously employed except corrosive sublimate, which is so poisonous that it is only to be used with very great care.

Woods and Forests: *R D.* Pooh!

Woodlice: *C J F.* See p. 54 of the present year's volume.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
Wm Inglis Carne, 10, Mark Lane, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. Edward Purser, sec.
Office—40 Bridge Street, Blackfriars.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
Offices, 37, Charing Cross, London.
Directors.
The Hon. J. W. Fortescue. | General Macdonald, C.B.
G. P. Irvine, Esq. | Newton S. Scott, Esq.
Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Solicitors—Messrs. Vallance & Vallance, 20, Essex Street, Strand.
Agricultural Chemist—William White, Esq.
Secretary—Mr. W. F. Mould.

The Directors invite the attention of landed proprietors, agriculturists, &c., to the Patent Cyanic Manure, as containing the most approved elements of fertilisation in their just proportions; it can be, therefore, confidently recommended as a very superior dressing for Wheat, Barley, Oats, Clover, Grass, &c. Price 8*l.* per ton.

Prospectuses (with practical directions for use) may be had on application, or will be forwarded by post.

All orders, applications for Agencies, &c., to be addressed to the Secretary, at the offices of the Company, 37, Charing Cross.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204a, Upper Thames Street, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. Gibbs & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; Mr. H. Campbell, 87, Dale Street, Glasgow; and from all the other Agents of the Company.

THE MANCHESTER SEWAGE GUANO COMPANY respectfully inform Agriculturists that they have made arrangements which will enable them to meet the increasing demand for their Manures. The MANCHESTER SEWAGE GUANO is a compost of Blood, Bones, Urine, Nightsoil, and other Animal Matters, and highly fertilising Chemical Ingredients, which are in a concentrated state incorporated with Animal and Vegetable Charcoal, ground to a fine powder, *the whole forming a dry portable Manure.* It is free from all kinds of Seeds, Weeds, &c., and enriches the land to a considerable degree for several years after it is used. Price 5*l.* 5*s.* per ton. Net cash on delivery. Testimonials forwarded on application. Carriage free to any Railway or Canal Wharf in Manchester.—John Thompson, Secretary, 3, Watling Street, Shudehill, Manchester.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.
Trustees.
Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.
Directors.
Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.
Edward Bell, Esq., Tottenham, Middlesex. | Robert Leeds, Esq., West Lexham, Norfolk.
John Clayden, Esq., Littlebury, Essex. | Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Richard Hunt, Esq., Stanstead Abbot, Herts. | Thomas Nash, Esq., Great Chesterford, Essex.
Thomas Knight, Esq., Edmonton, Middlesex. | James Odams, Esq., Bishop Stortford, Herts.
John Collins, Esq., Middleton Square, Pentonville.
With power to add to their number.
Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.
Manufactory, Plaistow Marshes, Essex.

The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.

They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have professed to make one possessing similar qualities. As security, therefore, to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7*l.* 10*s.* per ton.

Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, or sown broadcast; if the latter, it should be well harrowed in. Turnip Manure, 6*l.* 10*s.* per ton.

Delivered at any Railway Station or Wharf in London.

Applications to be made to Odams, Pickford, & Kerr, Agents for the above, 35, Leadenhall Street, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

PERMANENT PASTURE.

H. R. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., &c., to lay down Land to Permanent Pasture, at 25*s.* per acre, allowing three bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specified to the soil, purpose, &c., of each buyer.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the Seedsmen to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.

RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.

CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.

PARSNIPS.—Gibbs' large Guernsey Cattle, common large.

MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.

CABBAGES.—Large Drumhead Cattle, Thousand headed.

TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.

Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.

KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of both Agricultural and Garden Seeds sent free by post on application to Thomas Gibbs & Co., Corner of Half-Moon Street, Piccadilly, London.

RENDLE'S AGRICULTURAL PRICE CURRENT AND FARM DIRECTORY FOR 1855, *with Newspaper Stamp to go free by post, is now published, and can be had in exchange for six penny stamps.*

The proprietors of this well-known and widely circulated publication have much pleasure in announcing another edition for the present year. They have spared no expense nor trouble in making it a most useful and serviceable guide to all who take an interest in the cultivation of the soil. It contains a valuable Descriptive List of all the best AGRICULTURAL SEEDS, with prices affixed to every article, with cultural remarks and general information as to the best varieties for various crops.

The List of TURNIP SEEDS is very comprehensive, and is embellished with an ENGRAVING of RENDLE'S IMPROVED SWEDE TURNIP—a variety in great favour in the West of England.

The descriptive Lists and Tables of the best selected GRASSES are very complete, and will be found eminently useful to all who intend laying down land for Permanent Pasture, Ornamental Parks, Pleasure Grounds, &c.

There is a very useful ALMANACK, which has been compiled with much care.

In the MANURE DEPARTMENT there is a general Price Current of all the leading Manures, including Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, &c.

The ORIGIN AND HISTORY OF PERUVIAN GUANO will be found amongst its contents, as well as some excellent advice for detecting the spurious from the genuine article. The proprietors have been favoured with some good sound advice to Farmers on this point by J. C. Nesbit, Esq., the celebrated Agricultural Chemist. They have also reprinted Professor Way's Lecture on the same subject, from the *Gardeners' Chronicle*, read to the Members of the Royal Agricultural Society.

Descriptive articles relating to Lawes' Patent Superphosphate, Nitrate of Soda, the new Mexican Guano, and other manures will also be found very useful and interesting.

The "SUPERPHOSPHATE CONTROVERSY" in the Plymouth Papers is also given at length. The whole of the letters are reprinted from the *Plymouth Herald.* In this Controversy the "*Gypsum mixers*" are fully exposed by Mr. J. Pridreaux, the eminent Agricultural Chemist.

A valuable Paper has also been written expressly for this Edition by Mr. R. Errington on the "*Cultivation of the Potato,*" as well as an article on "*Liquid Manure*" by the same gentleman.

The Proprietors have also much pleasure in stating that they have been favoured with two Original Articles, by J. B. Lawes, Esq., Rothamsted, the celebrated Agricultural Chemist, on "*The Artificial Manures most suitable for the Growth of Barley*" and "*The Cultivation of one Grain Crop after another on heavy land.*"

There will be a good Engraving of the CEDRUS DEODARA, one of the hardiest and best varieties of Cedars ever introduced, and prices of various Forest Trees, Shrubs, and Fruit Trees.

Engravings and descriptions of a great many Agricultural Implements are also added in the present Edition, and amongst them will be found M'CORMICK'S AMERICAN REAPER, GARDNER'S TURNIP CUTTER, SAMUELSON'S REGISTERED LAWN MOWER, PATENT LIQUID MANURE DISTRIBUTOR, WARNER'S GARDEN ENGINES, PUMPS, SYRINGES, &c.; FOWLER AND FRY'S CHAFF CUTTING MACHINE AND ONE ROW TURNIP DRILL, ANTHONY'S PATENT AMERICAN CHURN, AND PARKES' STEEL DIGGING FORKS.

Descriptions are also given of the New CHINESE POTATO (Dioscorea Batatas) and the FLUKE KIDNEY POTATO, a sort highly recommended in the Midland Counties.

At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It contains 28 *folio pages, "Chronicle" size.*

Copies can be procured, price 6*d.* each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the
LONDON PUBLISHING OFFICE, 294, STRAND;
Or from the Proprietors, William E. Rendle & Co., Seed Merchants, Plymouth.

ALSIKE CLOVER (TRIFOLIUM HYBRIDUM).

SUTTON AND SONS have some pure genuine Seed of this superior new CLOVER, which will be found an invaluable Perennial Plant.

ITALIAN RYE-GRASS.

DICKENSON'S ITALIAN RYE-GRASS *may be obtained true of* Messrs. Sutton & Sons, *Reading. Priced Lists post free.*

CLOVER SEEDS.

GENUINE NEW CLOVER SEEDS *can be had at the lowest market prices of* JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

WHITE BELGIAN CARROT SEED.—Purchasers of Large Quantities will be treated liberally.

For prices apply to Sutton & Sons, Seed Growers, stating the quantity required.

SKIRVING'S SWEDE SEED.—Purchasers of Large Quantities will be treated liberally.—For prices, apply to Sutton & Sons, Seed Growers, Reading, stating the quantity required.

TO WHEAT GROWERS.

PETER LAWSON AND SON, the Queen's Seedsmen, Edinburgh and London, have received from North-West America a small quantity of two new kinds of WHEAT, which they are sending out in packets containing 200 grains. One kind is named Club-headed, cultivated by the old Californians. The yield is said to be very large, and forms a very beautiful delicate-coloured sample. Price 20*s.* per packet, containing 200 seeds.

The other kind is evidently a variety of Triticum durum, with solid stalks. It is very early, and well adapted for spring sowing. Price 15*s.* per packet, containing 200 seeds.—Orders may be sent to Peter Lawson & Son, in Edinburgh; or direct to their London House, 27, Great George Street, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
Incorporated by Special Act of Parliament.
Offices, 52, Parliament Street, London.
Directors.
Henry Ker Seymer, Esq., M.P., *Chairman.*
Sir John V. Shelley, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq. | William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S. | Sir S. M. Peto, Bart.
Henry Currie, Esq. | William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq. | William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. William Clifford, Sec.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament for England and Scotland.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. Wm. Napier, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. Nesbit, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE CONSULTING CHEMIST OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND (Mr. Way) is about to REMOVE his LABORATORY from 23, Holles Street, to 15, Welbeck Street, Cavendish Square, where, after the 25th of March, all communications and substances for analysis should be addressed. Mr. Way receives pupils into his laboratory for the study of Agricultural Chemistry.

The Agricultural Gazette.

SATURDAY, MARCH 10, 1855.

MEETINGS FOR THE ENSUING WEEK.

Wednesday, March 14—Agricultural Society of England.

Last Wednesday Mr. Lawes read a very valuable paper on Town Sewage, in which an immense mass of experimental and other research was brought to bear upon that important subject. The main result at which he arrived was that something more than 10,000 tons of ammonia, and 5000 tons of phosphates are annually washed into the Thames. A quantity of manure equal to the production of 600,000 quarters of Wheat is thus annually wasted. We shall hereafter give the details of the most interesting investigation by which he arrives at these startling results; at present we must confine ourselves to the bare mention of them.

To the discussion which followed Mr. Lawes's paper the best contribution was that of Mr. Chadwick. He considered Mr. Lawes's estimates considerably under the truth, seeing that he had confined them simply to the question of excrementitious matter, whereas in every household there was a great deal of other waste which also found its way into the sewers. Referring to the experience of the great London Water Companies, Mr. Chadwick declared that it was possible to pump up and deliver water by pipe at a distance of 20 miles for

2½*d.* per ton; and assuming the truth of his statement it will, no doubt, appear to many that the sewage manure question is at once settled. Unfortunately it is not so:—the question still remains, not whether the sewage water is worth 2½*d.* per ton, but whether it is better by that amount than water that can be had for nothing. We doubt if it be. Adding the rain fall to the water supply, and deducting the evaporation, as the basis of the estimate, Mr. Lawes's 10,000 tons of ammonia are distributed in the contents of our sewers through 200,000,000 tons of water: the dilution of the ammonia is one in twenty thousand, or something like 1½ ounce per ton! No wonder Mr. Lawes, in speaking of irrigation with it, spoke of 10,000 tons per acre as the dose desirable—a dose which we fancy cannot be delivered by machinery 20 miles away with profit. The only plan, as it seems to us, by which town sewage can be made use of—is, first, to hinder all the comparatively inoffensive portions of it, such as blood (to whose use as a manure we shall soon direct attention), from finding their way into the sewers; and, as regards the remainder, to provide some plan by which it shall be delivered upon Grass lands lower down the river, having travelled thither by its own weight. If this were possible, then the experience of the irrigation system in Ayrshire would strengthen expectations of success.

This latter subject and the Italian Rye-grass farms of Ayrshire were brought under the notice of the London Farmers' Club on Monday, in a paper which we give entire in the following pages. The Club accepted all the conclusions to which that paper tended, and adopted a resolution affirming the profitableness and the fitness of the Ayrshire practice, and recommending its adoption here. We must postpone consideration of the discussion which resulted in this resolution, but the main facts on which it hinged do, we think, to some extent sanction the expectation that if town sewage could find its way without artificial force on to meadow land, or especially on to Italian Rye-grass, near the metropolis, it might yet be profitably converted into milk. For though heavy dressings of manure are applied to this crop at Cunning Park, yet they are washed in with such enormous floodings of water that they do form, in fact, a very dilute liquid manure; and in our climate a still more dilute liquid, such as town sewage undoubtedly is, might be even more suitable.

The fact, for so it is, that Mr. Telfer keeps 48 cattle on seven acres of Italian Rye-grass during five months and a half of the year—that, from 7 Scotch acres, five-and-a-half-twelfths of the whole annual produce of his dairy are in this way derived—that five-and-a-half-twelfths of the 30,660 gallons of milk which he obtains, *five-and-a-half-twelfths of the two thousand pounds and upwards* for which that quantity of milk would sell in London were obtained by these bulky dressings of dilute liquid manure from 7 Scotch acres of land—this fact does, we think, justify the expectation that some method of turning our sewage to a profitable account will yet be found.

We have received a most important communication from Mr. Lawrence, of Cirencester, on the Mustard Adulteration of Rape-cake, to the nature of which, as we are forced to postpone its publication for a week, we may in a single sentence here allude. It appears from Dr. Voelcker's experiments, that those ferments in Mustard seed which under certain circumstances, such as maceration in cold water, excite the formation of the poisonous irritant to which many losses from the use of adulterated Rape have been owing, lose their efficiency for this purpose, are, in fact, coagulated and rendered inert and powerless if the cake containing them be submitted to boiling water. Mr. Lawrence details his experience in confirmation of these laboratory results of Dr. Voelcker. We hope to give it next week; and in the mean time, as the earliest information of this kind may be useful, it is well to understand that liability to loss by adulterated Rape-cake will be diminished, if not destroyed, by breaking it down and putting it in boiling water before using it.

We have received several letters in connection with Mr. Bailey Denton's comparison last week of the several companies for the permanent improvement of land. As to the present rate of the rent-charge made by the Lands' Improvement Company to repay a loan, capital and interest, in 25 years, it is not 6*l.* 17*s.* 6*d.*, as stated by Mr. Denton, but 6*l.* 15*s.*, as stated by us in some articles on the subject published last autumn, since which time it has not varied. That is a mere matter of fact, which we give with perfect confidence on the authority of the Company itself, and it cannot therefore be disputed. For the amount of the charge quoted by Mr. Denton, nevertheless, he is not responsible, seeing that he took it from a printed circular obtained from the Company, in which, by some mistake, the blank left for the amount of the charge was filled up as he quoted it.

It would be easy to enter here into a detailed comparison of the two companies, the General Land Drainage Company and the Lands' Improvement Company, and attempt to justify any preference at which, after such a comparison, we might arrive, but we think that to do this would be beyond our province. Our duty is done when, on the one hand, the national advantages are pointed out of that unlimited source of ability provided by one of the companies for those who have but a limited interest in their land; and when, on the other, the main features of these companies have been, in somewhat general terms, compared, as was done the other day. If any *correspondents* shall be disposed to state their personal experience of any of these companies, we shall be very glad to hear them, and so no doubt will our readers. Communications of this kind from *them* would be most useful, and we hope they may be forthcoming. But it will be better, we think, after the immediate differences which we have unwittingly provoked shall have been allayed, that the merits or demerits of the rival companies be declared by their *bonâ fide* clients respectively, rather than by their office-bearers.

THE CULTIVATION OF ITALIAN RYE-GRASS.

[The following paper was read at the meeting, last Monday, of the London Farmers' Club, by Mr. John C. Morton.]

It may be right to state at the outset of this paper that my object in naming its subject for discussion, and in gathering all the information which I could upon it by correspondence with the principal growers of the plant, and by personal inspection of the farms in Ayrshire and elsewhere where it is grown, has not been to prove anything whatever with regard to *persons*. Of course this remark will be understood by those who have read the angry discussions that ensued upon the late Tiptree gathering. I shall avoid all personality, whether in the way of praise or censure. No reference to past statements on the subject shall be made—statements which have been disputed, defended, and condemned, with a good deal of unnecessary temper—no attempt to determine where the credit is due, if there be any doubt as to the originality of this, that, or the other in connection with the cultivation of Italian Rye-grass. In what degree Mr. Dickenson or Mr. Rodwell, Mr. Lawson, Mr. Kennedy, Mr. Telfer, Mr. Mechi, and Mr. Ralston are copyists or originators I have not tried to ascertain. There is an aspect presented by the subject more important surely than the personal: I hope every one will agree with me in that; and instead of trying to defend or to condemn what has been already said about Italian Rye-grass, especially about the extraordinary crops of it at Myremill and Cunning Park, I have tried to forget it all, and considering the cultivation of this plant simply as a subject of great agricultural importance on its own account, I have lately done my best to inform myself of the actual experience of its growers in order that I might be able, through the London Farmers' Club, to call the attention of agriculturists generally to what so many of them now already perfectly know, the extraordinary merits of the Italian Rye-grass as a forage plant.

(Late Rapid Extension of the Crop.)

This may be proved, first, by the rapidly increasing sale it is receiving. It has been known to British agriculture for nearly a quarter of a century. In 1831 Messrs. Lawson first imported it; 160 bushels were that year shipped from Hamburgh and sold at two guineas a bushel. The imports increased year by year; in 1840 they were 5000 bushels—in 1853 they were 40,000 bushels—by this one firm alone.

Mr. Lawson writes to me as follows:—

"The first importation took place 24 years ago, viz.:—

	Bushels.	Selling price.
In 1831	160 ...	... 42*s.* 0*d.* per bushel.
1832	320 ...	... 35 0 "
1836	1,000 ...	... 15 0 "
1840	5,000 ...	... 10 6 "
1841	6,000 ...	... 10 0 "
1850	25,000 ...	... 7 6 "
1851	28,500 ...	... 7 6 "
1852	30,000 ...	... 6 0 "
1853	40,000 ...	... 5 6 "
1854	32,900 ...	... 5 6 "

"The large increase in 1853 is attributable to a slight deviation in the usual channels of sale, our wholesale transactions having assumed an importance in that particular year, owing to trade arrangements, which it is not necessary to particularise. Our present year's importations are not yet completed, but we think they will not exceed 35,000 bushels. There is no doubt that the consumption of Italian Rye-grass is progressively increasing—for independently of our own sales, other parties in the trade have also become importers—to what extent we cannot exactly say, but we have every reason to believe that our own imports represent three-fourths of the foreign seed consumed in this kingdom. Of home-grown seed we have no means of judging, but our long experience in the trade warrants us in saying that the foreign seed is to be preferred even at a higher price. No complaints have been urged against it, which is more than can be said of the English seed. The factitious value of this seed is owing to its being better cleaned than the foreign. There is not the slightest difference in the plant. The arrangements now made by us with the growers in Italy ensure its being perfectly cleaned. There can be no question but that the fact of foreign seed being ill cleaned induced cultivation in this country, and many growers have bestowed pains in preparing it for the market under their own names. Farmers should, however, be cautious in estimating the quality of the seed by the luxuriantly-grown samples from which the seed is said to be and undoubtedly is produced. This luxuriant growth having been superinduced by liquid manure, a disappointment results if the crop with common manuring does not equal its parent. But we need not enlarge on this. As to the comparative breadth of Italian and common Rye-grass, no one can speak; for not a twentieth part passes through the hands of the seedsman. Our own transactions in the latter have been to the extent of 95,000 to 100,000 bushels, ranging over the past five years. But this must not be taken as bearing the exact proportion to the Italian, so far as consumption goes."

But wholesale dealings are not so satisfactory a proof as those which represent sales to actual cultivators of the soil; and on this point Messrs. Drummond, of Stirling, tell me that their retail sales alone in Stirling during the last six years have been 120, 130, 190, 220, 280, and 350 quarters respectively—an obvious testimony to the increasing reputation of the crop. In like manner Messrs. Gibbs, the seedsmen to the Agricultural Society of England, tell me "the quantity of Italian Rye-grass sent out by us increases every year, and the demand is at least double what it was seven or eight years since. The quantity, however, actually sown is no doubt much more than double, as it can now be obtained from nearly all the local seedsmen." Mr. Sutton, of Reading, tells me that their firm sold last year 1096 bushels retail, against 1161 bushels of other sorts of Rye-grass; this is of course independent of all wholesale dealings, and of sales of both in mixtures for permanent Grass. But perhaps the most curious evidence of the gradually but rapidly increasing estimation in which the plant is held is given by Mr. Rendle, of Plymouth, who has been kind enough to examine his books during the past 15 years for me, and his retail sales alone of the seed during that time have been year by year as follows—in 1840 only 25 bushels, and this followed in successive years by 30 bushels, 30, 50, 50, 60, 70, 90, 100, 180, 240, 400, 500, 600, and 700 bushels per annum. In fact, as Mr. Rendle says, the use of the seed is not now confined to a few of the more enterprising cultivators; it is general, and everybody sows it.

Well, then, seeing that the plant has already fully established its claims to cultivation, it is an easy task for me to advocate them. I wish, however, more especially to call attention to that method of cultivation which has been adopted on the liquid-manure farms in Ayrshire and elsewhere, and to the extraordinary results which have attended it. But before doing this, I must answer the questions of those who wish to commence its cultivation and its management in the ordinary manner.

(Ordinary Cultivation of Italian Rye-Grass.)

Italian Rye-grass prefers the adhesive class of soils—loams and clays. The quantity of seed recommended for growth by itself, is 3 to 4 bushels per acre. Mr. Dickenson recommends 4 bushels: Mr. Sutton, of Reading, and Mr. Drummond, of Stirling, recommend 2½ only; their seed is, however, probably above the average quality. I fancy the Ayrshire practice may be safest, which is to sow 3½ to 4 bushels per Scotch acre, corresponding to fully 3 bushels per imperial acre. This, I find, is Mr. Mechi's quantity. When sown with a mixture for permanent Grass, 8 lbs. or 10 lbs. per acre is an ample share. When sown with Clover 1 bushel per acre, with 12 lbs. of mixed Clover seeds, is sufficient. In that case it should be sown as late as possible along with the grain crop. If it could be hoed in early in May it would be best. If sown as early as usual it would by its rapid growth materially interfere with the harvesting of the crop. But for a full crop it is best sown by itself, *i. e.* without a grain crop; and then, as soon after harvest as possible is the proper seed time. Mr. Drummond recommends 2 or 3 lbs. of Alsike Clover to be sown along with 2½ bushels of Italian Rye-grass as early in autumn as possible. At the first cutting early in summer, this Alsike Clover was 18 inches high, and the whole was a very heavy crop. Mr. Sutton recommends to sow Italian Rye-grass by itself—making an exception, however, in favour of Trifolium incarnatum if it be sown in August—a very large crop of both is obtained, and the Trifolium is made surer and more abundant for its nursing by the earlier Rye-grass.

A great deal of the success of the crop depends upon the choice of seed. It may not be of a good sort, for there are varieties; it may be imperfectly ripened; it may be imperfectly winnowed; and it may be adulterated. Its weight varies from 15 lbs. per bushel up to as much as 28 lbs., which is the extraordinary weight named by Mr. Drummond. It is much adulterated with Hair Grass and common stable seeds; and its varying weight indicates how much mere husk is often mixed with it even if it be a genuine sample. Mr. Rodwell, of Alderton Hall, Suffolk, some years ago pointed out the necessity of selecting the right sort, showing that they differed very materially, and Mr. Sutton writes to me as follows:

"Much of the misapprehension and diversity of opinion respecting productiveness of Italian Rye-grass has, we believe, arisen from the assumption that there is but one kind of Italian Rye-grass, or that all varieties possess the same properties or nearly so; whereas we have repeatedly proved that there are probably as many varieties of Italian as of English or Scotch Rye-grasses, and that the productive and nutritive properties of some greatly exceed others. This we found to be the case with a kind we procured from Mr. Dickenson, then at May Fair a few years since, as also another very productive variety, which for distinction we have kept under the name of "Sutton's" and the other "Dickenson's." So great is the difference in the produce of these and that of other varieties of Italian Rye-grass which we have sown, that we are not surprised at the great weight per acre grown by Mr. Dickenson with a copious supply of liquid manure. To the above remarks I may add, that some years ago a rather distinct variety was brought before the Council of the Royal Agricultural Society of England by Mr. Rodwell, which was of a darker green than other kinds, and having a brown tint to ears of bloom or seed; it was a good variety, but not considering it superior in

quality to those above alluded to, we did not preserve the stock. Fresh imported seed always produces a large bulk of Grass the first year, but is generally foul with seeds."

On this subject, too, Mr. Drummond writes :—

"Seed from Lombardy we find upon the whole the best, as we are always sure of it growing an early and luxuriant crop. Much of the British saved seed is in its character and habit as late as common Rye-grass, that it is not one whit earlier. A great deal of it is sown on ordinary land, instead of common Rye-grass, among with the Barley crop, the seed of which, produced, it has been the direct produce of Lombardy seed, may be. But if this be again sown in the same way it will be greatly degenerated, and in a year or two valueless as Italian Rye-grass. When we do make use of home-saved seed we must have it from the direct produce of Lombardy, and saved the same year in which it is sown; i.e., sown alone in April and harvested the same season. We have proved dozens of times the inferiority of the general run of home-grown seed. Lombardy seed looks bad, and is slovenly 'cured,' and it does not vegetate equal to our own home growth, so that it requires to be sown rather thicker."

So much for the kind and quantity of seed and time of sowing. On the last point I may repeat, that it may be sown very late among corn; but is best sown by itself, either as early as possible after harvest, when a first cutting is to be had very early next spring, and it has been even known to yield a cutting in November, and certainly a good bite for sheep; or in March, April, or May, of the following year, (when if sown in March) there will be a cutting towards the end of June. The plan is to clean the land and roll it hard, and sow three bushels broadcast, and brush-harrow it in and leave it. The plant if properly manured, and that the liquid way is the proper one I cannot doubt, will keep down every other thing.

As to the produce under ordinary management, it will yield 3 good cuttings in the year if watered with the water-cart as industriously as possible, and if the land be in good heart to begin with. But if watered copiously—as it can be only by a system of pipes and tanks and force pump—you may have 4 up to 8 cuttings, according to the stage of growth at which you wish to take it. It will stand being cut later than ordinary Rye-grass, for it does not become so woody at as nearly ripe, and it will do to cut very young also, and Mr. Dickenson tells me that he has cut it even 10 times in one season. I do not refer at greater length to his experience, because he is soon to publish a pamphlet on the subject. If allowed to seed Italian Rye-grass yields a fair crop. I once sold 90 sacks, *i.e.*, 360 bushels, weighing 17 lbs. a bushel, off 19 acres, and this was not a good crop; it was a second cutting that year. The seed is difficult to save from its liability to shed. The swathe was tied up in small sheaves at once and stooked as Wheat is, and carried at once to the board upon a large sheet in the field, where a couple of men could thresh it out almost as fast as a horse and cart could fetch it; two or three blows upon each sheaf sufficed to knock the seed out. That then is all that need be said about the ordinary experience of this crop.

(Cultivation at Tiptree.)

Mr. Mechi, who, as we all know, adopts the liquid manure system, states his management and experience of it as follows :—

"We sow 3 bushels of Italian Rye-grass per imperial acre—broadcast with the seed-barrow on the Wheat crop—before the last horse-hoeing, which works it in. As soon as the Wheat is harvested, the Grass is irrigated at the rate of 10,000 gallons per acre, which gives us abundant autumnal feed. Before Christmas it is again irrigated once or twice, and about the 20th April to the 10th May it affords an abundant mow. Last year on 6 acres of poor, stony, rocky soil we kept 100 fattening sheep from the 20th April to the end of August, the sheep never having been removed from the land. They were folded, and had Rape-cake. This was the second year of the Grass which had been several times mowed in 1853. The land was ploughed in November, sown with white Peas, which will be picked for the London market, and followed by Turnips. I should say that the hose and jet followed the sheepfold. I prefer taking broad-leaf plants after Rye-grass, rather than cereals. As a general rule, our Rye-grass gives us abundant food in the spring, whilst our neighbours are sadly deficient. It also gives much late autumnal feed. When we mow, 10,000 gallons are applied after each cutting; without this *we have no crop* in the summer. More weight can be obtained by mowing than by folding; the latter interferes with the rapid growth of the plant."

(The Ayrshire Farms.)

I now come to the description of such of the farms in Ayrshire where Italian Rye-grass is cultivated as I have seen. You are all aware that at several places in that county the system of irrigation by underground pipes for the distribution of liquid manure has been applied especially to the cultivation of Italian Rye-grass. And such very extraordinary statements have been made about the results, both in the field and in the cattle stalls, of this mode of management, that I was sure, when this subject was named for discussion before the London Farmers' Club, that a great deal of its interest would hinge upon the truth or inaccuracy of the statements referred to. I went to see these farms, therefore, the week before last, in order to make personal inquiry into the subject, and so be able to speak this evening with the confidence of an eye-witness. There are five farms in Ayrshire where pumps and pipes are in operation for the distribution of liquid manure:—Myremill, about 8 miles east of Ayr, on the Maybole road, the property of Mr. Kennedy, a banker in Ayr, and occupied by Mr. Kennedy, his tenant; Cunning Park, a farm of 50 imperial acres, on the sea shore, one or two miles south of Ayr, occupied by Mr. Telfer; Enterkine, three or four miles S. W. from Ayr, occupied by Mr. Bell; Lagg, occupied by Mr. Ralston, a high-lying farm, nearly all arable however, some four miles from Ayr, on the south road which runs by Cunning Park; and a farm in the occupation of the Marquis of Ailsa, some 4 or 5 miles farther south. I saw Myremill, Cunning Park, and Lagg. Enterkine, I was told, was stiff clay land: those parts of Lagg and Myremill which I saw are what would probably be called a somewhat brashy loam, and Cunning Park is a light sand. Mr. Kennedy, the tenant of Myremill, has for many years had experience of the value of manure applied in the liquid form by watercart both on common Rye-grass and Italian; and it was out of a conversation with his landlord in which his own experience, along with Smith of Deanston's plan for distributing the liquid sewage of towns, was discussed, that the plan of underground piping for distributing the farm liquid was determined on. This was seven or eight years ago.

Myremill is a farm of 800 imperial acres, and of these 320 are furnished with underground piping, extending, some of it, to the distance of near a mile from four tanks on the farmery, which together hold 300,000 gallons. The farmery is placed on the summit of one of the knolls or undulations of the land, and its tanks are thus above most of the land of the farm—but when the pump is in operation its force, whenever more than sufficient for the work of distribution whether on the fields below it or above it, opens the way to a higher tank at a distance, in which, therefore, any surplus liquid is accumulated for use by gravitation at any future time. The supply for these tanks is as follows :—water *ad libitum*, pumped into them from a neighbouring stream—the liquid of some 150 cattle kept pretty constantly throughout the year in byres—the drainings of the open yards and sties—and the whole manure of 450 sheep kept in a house on boards, the spaces beneath being flooded out occasionnally, just as they are at Tiptree, as most of us have seen. Besides this stock of manure Mr. Kennedy purchases at 6*d.* a gallon the concentrated gas-water of the neighbouring gas-works of Ayr and Maybole, and of this he procures 800 to 1000 gallons in the year. All the liquid made during at least nine months of the year and all this gas-water is put on 84 imperial acres of Italian Rye-grass. The liquid made during about three months of winter is poured on the fields intended for Mangold Wurzel and other green crops. Those, then, are the means employed at Myremill.

Now for a word on Mr. Telfer's farm. As you approach Ayr by railway from the north, the sea upon your right is hidden by a waste of sandy hillocks but imperfectly bound together by the wiry roots of the scanty Grass with which in patches here and there they are covered. This is in fact, a district of blown sea-sand, in which rabbits burrow. On your right, again, the same sand has been levelled, and is cultivated, and by dint of manuring, is made to grow Turnips and other food for sheep, which there, as everywhere, at length impart fertility. Through this sand the water of Ayr finds its passage to the sea, and on its banks the town is built. South of the town the same kind of soil occurs, in a narrower line however, along the shore, and it is soon altogether stopped by the high lands, on the summit of which, close by the sea, lies the farm of Lagg—Mr. Ralston's occupation. Before you reach these high-lying lands—and before you leave the sandy tract—you come, as you travel southwards, upon Mr. Telfer's farm of Cunning Park. It is an old enclosure from the blown sand of the shore—50 acres in a rectangle lying between the south road and the sea—formerly, no doubt, a sandy waste, but at what date I do not know; and while the difference which *to the farmer* it exhibits from the wilderness it was is at least as great as that exhibited by the richest specimens of fertility I know, that difference is in this case wholly due to Art and not to Nature. The sand on some of its extent has been heavily clayed, and has yielded heavy crops of Wheat, but a great deal of it that I saw was as light a sand as was ever cultivated—a pure sand soil which the severe frosts of this winter have failed to make cohere. The manure applied to these acres consists of (1) an endless supply of water; (2) the whole liquid and solid excrement of 48 cattle in the byre, which are highly fed on food grown and purchased; (3) 10 cwt. per acre of artificial manure over the whole of the extent in Italian Rye-grass, 6½ cwt. of guano per acre over the Cabbage and Mangold Wurzel, and about 2½ cwt. per acre over the whole of the Wheat. All these are after the rate of imperial measure. There are only 21 Scotch acres, that is, rather more than 25 imperial acres, under the irrigation system; the other part of the farm is managed in the ordinary way.

I pass now to Lagg, some three miles further south, and probably between two and three hundred feet above the level of the sea. The farmery here is high above the land under irrigation—so high that the liquid from the cattle runs down some 40 or 50 feet, I should think, to the tanks, where it accumulates for use by gravitation on the fields still lower down. These fields, extending over 60 imperial acres, are on a slope; the upper part probably 70 or 80 feet above the lower, but all sufficiently below the tanks to give pressure enough for distribution of their contents through flexible pipes from the fixed hydrants. The soil here is much the same as at Myremill—a good but somewhat brashy loam, worth, I dare say, 35*s.* an acre. The manure used upon the land under irrigation is the liquid from 60 large cattle and 20 horses—with nearly 2 cwt. of artificial manure per acre washed into the land after each cutting of Italian Rye-grass. The extent under Italian Rye-grass at Lagg each year is 12 acres, and this receives all the liquid except during two or three months of winter, when the land for root crops gets a dressing. The extent sown each year at Myremill is 42 acres, and at Cunning Park 4⅓ acres. This, let me say, is sown in March or April, or late in autumn, and kept on through the following year and until the end of summer in the year after that. So that going in the summer time you would see at Myremill 42 acres of old Grass and 42 acres of new Grass, and at Cunning Park 4⅓ acres of old Grass, and 4⅓ acres of new Grass, *i. e.* 70 Scotch acres on the one farm, and 7 Scotch acres on the other.

As to the mode of sowing I will give Mr. Kennedy's practice. He ploughs up an Oat stubble in autumn, puts the grubber and the harrow through it, and gets it clean; then he rolls as hard as he can, sows 4 bushels of seed broadcast—that is 70 lbs. or 80 lbs. per Scotch acre—and brushes it in. That is the whole affair. It comes up—gets a flooding with the liquid (about 6000 gallons) as soon as well above ground—is cut, if sown early enough, the first time late in April, and yields three or four cuttings—and after each cutting gets soaked with the liquid manure. It yields again three cuttings, or perhaps four next year, and is then ploughed up and goes into the regular rotation of the farm. The five years' course prevails there—1 Wheat, 2 Turnips, 3 Oats, 4 seeds mown, and 5 seeds depastured; and the Italian Rye-grass occupies perfectly and without disturbance the place of the two years' seeds over 42 acres of the land; and that generally is the plan followed on the other farms. Mr. Telfer has, indeed, occasionally for several years grown Italian Rye-grass after Italian Rye-grass, and found it answer perfectly, but I understood him to say that he, too, grows it as a general rule in succession with other crops.

(Produce under the Irrigation System.)

And now as to the produce obtained from Italian Rye-grass under this cultivation. I will commence with Mr. Telfer's case; and let me here say, that I have never been on a farm where such a detailed record of every operation and its result is kept as is kept at Cunning Park. The result of this is, that the order and cleanliness apparent everywhere are most remarkable. I would rather finish the biscuit I had dropped in Mr. Telfer's cow-house than if I had to pick it off the floor of many a cottage I have visited. A record is kept of the daily food consumed, and of the daily produce of the four lots of cows in which the whole are arranged: 47 cows of the Ayrshire breed and one bull occupy the house. They receive, while on Italian Rye-grass fully, four feeds daily, amounting to from 2 tons to 56 cwt. of the Grass among the 48. The Grass is allowed to stand till on the point of putting forth its seed-stem; it is then more substantial food, containing less water and more starch and sugary matter. When younger it contains, along with more water, more of the substances corresponding to the gluten of Flour, and which chemists tell us resemble the fleshy part of animal matter. Those who wish to make flesh by their consumption of Italian Rye-grass may, therefore, be right in cutting frequently and having it younger. That is Mr. Dickinson's plan. Mr. Telfer makes butter, and is right in cutting it less frequently—often only three, sometimes four, or at most five times in the year. He has a drier food in consequence. His object is to have a food for his cows containing 20 to 25 per cent. of solid matter, and he mixes chaff and hay and meal with his Mangold Wurzel during winter in order to obtain this result. His opinion of the relative merits of the younger and the older Grass is founded on analyses by Dr. Anderson, of Glasgow, from which it appeared that the Italian Rye-grass 17 days old 17 or 18 inches high, and weighing about 9 or 10 tons per acre, contained 86 per cent. of water; and when five weeks old, or 3 to 3½ feet high, and weighing 20 tons an acre, only 74 per cent; in the former case three per cent. of the protein compounds corresponding to fleshy matter in the animal—in the latter only 2½; while the starch and sugar present in the former were only 5½, and in the latter 10½ per cent.

It is no part of my present business to state the winter feeding of this cow-house, or to do more than relate what share this 8⅔ acres of Italian Rye-grass have in the maintenance of the live stock. I may say, therefore, that the Italian Rye-grass is, as a general rule, the whole maintenance of the stock so far as green food goes during the months of May, June, July, August; that it is most of their maintenance in September; and that it is half their maintenance in April and October. This was the case last year, when 8⅔ acres of Italian Rye-grass, half of it sown in the spring of last year (for the seed was not got in in the autumn of 1853 as usual), yielded 270 tons of green food, besides a crop of hay off the old Grass, which was left for hay in the autumn, the younger crop being then in full bearing, and sufficient for the feeding of the cattle. Now it is very little to say that 48 cattle are maintained—that 30,660 gallons of milk (for that is the average year's produce from the 47 cows), that 30,660 gallons of milk were made upon 50 acres of land, half of it under this irrigation system—that a quantity of milk worth, at 2*d.* a quart, upwards of 1000*l.*, or at 1*s.* 4*d.* per gallon, 2044*l.*, was made upon so little land—because the question remains where their food came from; and there is many a London dairyman with no land at all that maintains a larger herd and makes a larger quantity of milk. I will therefore just add the cropping of the land last year. Of the 25 acres under irrigation there were 8⅔ acres in Italian Rye-grass yielding 270 tons of green food besides a crop of hay; there were 3⅔ acres in Cabbage yielding 150 tons of Cabbage, 10*l.* worth of which were sold; there were 7½ acres of Mangold Wurzel yielding 250

tons, 80 tons of which were sold at from 23s. to 30s. per ton, according to the season; and there were nearly 6 acres of Wheat, which yielded the extraordinary measured produce of 405 bushels. And it is an extraordinary thing to say that the 25 acres under irrigation wholly kept those 48 cattle, that is to say, that the grain, and Mangold, and Cabbage sold will pay the hay and Linseed, Bean, and manure accounts. That they will not do so another year is probable, seeing that the greater part of the Wheat sold at 10s. a bushel. Mr. Telfer writes me—"The food obtained for my cattle from the other 19 Scotch acres—that is, nearly 25 imperial—not under irrigation, is charged against them at the price it can be purchased in the market (sixty feeds, *i.e.*, 30 tons of Grass, and a quantity of hay, with Oats and Oat-straw); I expect my sales of Mangold, Cabbage, and Wheat to cover this as well as all other purchased food." And in another letter I have received from him he says—"My calculation at present is that the grain, Mangold, and Cabbage sold off this farm will pay for the hay and Linseed, &c., and manure accounts."

Let me give the history of an acre of Mr. Telfer's Rye-grass. It is sown in autumn, as I said of Mr. Kennedy's, about 4 bushels per acre, and brushed in and watered, and left till spring. Sometimes it is very late; and when I was at Cunning Park the week before last, it was barely up, and had been cut down by the frost, and might have to be sown again. In that case it would be as it was last year, a spring sowing; in that case its first flooding would be followed by a first cutting in perhaps June, when 10 or 12 tons per acre might be expected from it. Immediately after cutting, between 3 and 4 cwt. per acre of mixed Peruvian guano and sulphate of ammonia are sown upon it, and 1 inch, or 100 tons per acre of water are poured upon it through the pipes, containing such a share of the liquid excrement of these 48 cattle as belongs to the period since the last pumping took place. Mr. Telfer attaches immense importance to this immediate manuring and flooding with water: and he lets the water on direct from the pipes to the land; he does not send it flying in a shower through 40 or 50 yards of it may be dry air, which would run off with half its excellence, but he sends it directly to the roots of the plant. The flooding follows the cutting immediately, the Italian Rye-grass uses the ammoniacal manure especially during the early stage of its growth, and by applying the liquid at once it gets the start of all weeds. In five weeks the land will be covered 3 feet high with a thick luxuriant growth, weighing dry, *i. e.* without dew or rain upon it, at least 16 to 20 tons per acre. This is cut and followed by another manuring in a similar manner, and a third cut of 16 to 18 tons may be expected pretty early in September, and a further manuring will give you 10 or 12 tons per acre towards the end of October. In spring another dressing of the water gives a cutting towards the end of April, and a second and third cutting will be had, together weighing 45 to 50 tons per imperial acre, by the end of August. The land is then allowed to grow the crop unassisted, and a crop of hay or seed may be had in the early part of October, after which it is broken up. During the two years that acre will have yielded between 80 and 100 tons of green food per acre, in seven cuttings, by the use of a ton of guano, sulphate of ammonia, and nitrate of soda washed in with 700 tons of dilute liquid. I am not stating this produce as an actual history, but as what I believe to be a moderate estimate, founded on the information I have obtained, of what any one of us may get under favourable circumstances if we adopt Mr. Telfer's system. Mr. Telfer states the produce, as actual history for one year, of his 7 Scotch acres—that is of 3½ Scotch for the two years of their existence—at 270 tons of green food besides the hay—*i. e.*, less than 80 tons per Scotch acre for the two years. But it is right to give the following facts in connection with this 270 tons from 7 Scotch acres. Three and a half Scotch acres were sown in the spring of 1853, and 3½ Scotch acres were sown in the spring of 1854. The former yielded 3 cuttings in the former year and 2⅔ in the latter year, and it was then allowed to seed; and the 3½ acres which had been sown in the latter year yielded 3 cuttings: so that, taking the latter year alone, 5½ cuttings were obtained. The old Grass yielded 2⅔ cuttings; that is to say, during the third cutting in the beginning of July the scythe was stopped, and the liquid manure following it was also stopped—the mowers being sent in to the younger Grass sown that spring, as it would otherwise have gone to seed. It will be seen, then, that owing to the seeding in both cases being in the spring, and especially owing to the manure being stopped so early in the season, only 5⅔ cuttings in all were obtained in the year from the two plots of one-year-old and two-year-old Grass. In calculating what, under more favourable circumstances, might have been, I think that *that* ⅔ of a cutting only has to be deducted, as it alone of the older Grass can be called contemporaneous in its growth with the first cutting of the new, and thus 5 full cuttings might have been obtained from that 3½ acres of the two-year-old Grass in one year. It is, however, of little importance, and there is little need, to speculate on what might have been. The actual history of that produce, crippled as it was, is extraordinary enough. My version of what might have been is, nevertheless, corroborated by the following actual history of facts, which Mr. Kennedy gave me as the produce of 16 Scotch acres of Italian Rye-grass last year as follows:—On April 20, a cutting commenced and on each day a perch was measured and its produce—cut if possible dry—was weighed dry; and the weight per acre calculated by a perch weight ascertained each day was 16 tons; the 2d cutting, ascertained in like manner, was 25 tons; the 3d was 17½ tons; the 4th, in September, was 16 tons; and after that a foot high of Grass was eaten down by sheep, which if it had been cut would have been 8 or 10 tons per acre. This was 74 tons per Scotch acre in *one* year. That was the first year of a crop sown in September of the previous season. There must be added to it the two or three cuttings of the next season before we get the quantity that one acre will have yielded in the two years, corresponding to the two years' produce which I have estimated at 80 to 100 tons per imperial acre.

Mr. Telfer's farm is, as I have intimated, a dairy farm. He finds it his interest to grow food at this high pressure rate, although he is 400 miles from the market for his butter. His butter comes up to Jermyn Street, and I believe it fetches as high a price as any in the market; and I believe that, notwithstanding the expense of carriage and the high pressure under which it is made, it reaches Jermyn Street with as little on its head per lb. to answer for, with as large a balance, I mean, per lb. of profit to the maker of it, as any that is sold. We surely all agree with Mr. Telfer that the power through this Italian Rye-grass of producing a large quantity of vegetable matter where milk brings so high a price as it does in the neighbourhood of large towns, becomes a far more important consideration to persons situated near London, than it does to the tenant of an Ayrshire farm. And I quite expect, as the result of this day's meeting, to find that Mr. Telfer's practice is being copied in the neighbourhood of London.

I have yet to say a few words of Mr. Kennedy's farm, where Italian Rye-grass goes to the manufacture of meat. It is, as I have said, 750 Scotch acres, or 900 imperial acres, in extent: 180 acres are in Wheat, 180 acres in Turnips, Swedes, and Mangold Wurzel, 180 acres in Oats, 180 acres in one-year-old seeds, 180 acres in two-year-old seeds. Of these 180 acres kept two years in Grass, 42 are Italian Rye-grass; 420 of the 900 acres are under the system of irrigation by underground pipes for the distribution of the contents of the tanks. The green food of this farm, along with certain portions of Rape-cake and Bean-meal, and along with steamed straw keeps a herd of 250 large cattle fatting to 7 cwt. and upwards (a very even lot of cattle, under capital arrangements as to feeding and accommodation, I saw there the other day), 450 sheep (improved Cheviots), fatting to 16 or 18 lbs. a quarter, and selling for 42*s.* to 47*s.* a-piece; and from 150 to 200 pigs and 25 large Clydesdale cart horses. These are besides the sheep in the fields. Three such lots of sheep are passed through the hands in the year, the cattle may be kept longer—more nearly five months than four on average; but that stock, excluding the sheep in the fields, is the average quantity constantly on hand, and 42 acres of young Italian Rye-grass, and 42 acres of two-year old Italian Rye-grass keep them during about five months of summer. The cattle get about 6*s.* or 7*s.* worth of Rape-cake and Bean-meal per month a-piece. The sheep get half a pound of the mixed food a day, or not much more than 8d. or 10*d.* worth a-piece per month; and beside that from April till October they get only Italian Rye-grass. The sheep eat from 10 to 15 lbs. of this green food a day, and the cattle from 100 lbs. to a cwt. a-piece. It is the universal testimony there that the Italian Rye-grass never palls upon them. They get tired of Clover, but not of this Grass. The sheep are on open boards in pens, 12 feet by 6, holding 10; there are two rows in the width of a long L-shaped building, with a central passage. They looked healthy, comfortable, and prosperous. The labour of attendance on 450 sheep so kept is only 16*s.* a week, the wages of a man and woman who supply the food. The labour of providing the Italian Rye-grass for all the stock (cutting and carrying it from the field) is done by four horses constantly employed in carting, and two men constantly mowing during the season, besides women raking.

Mr. Kennedy states that he will undertake to keep 70 to 80 sheep per Scotch acre for five months of summer on Italian Rye-grass cultivated in this manner. This is 60 sheep per imperial acre. They fatten to 18 lbs. a quarter. Their consumption may be 16 lbs. a day on the average, besides the ¼ lb. of Rape-cake and Bean-meal. 960 lbs. of green food daily for five months is 64½ tons of green food per imperial acre; and that I do not in the least doubt is not only a possibility as an individual fact, but it is a possibility as an average experience. Besides the flock of sheep, viz. 450 in the house, some 7 sheep per acre are kept upon the Clover during summer, and 3000 sheep in all are sold off the farm to the butcher in the year. How great an auxiliary the Italian Rye-grass is to the general interests of the farm, appears in the quantity of manure which the great stock kept on it during summer enables to be made. Mr. Kennedy had 7000 cubic yards of manure in made and measured heaps upon his farm last spring. His plan is as I have said to apply gas-water with the liquid manure. At every dressing, and there are often two after each cutting, he puts 20 gallons of the concentrated water per acre into the tank from which the liquid manure is to be taken, and this with 5000 or 6000 gallons per acre is the usual dressing. That the liquid is of immense importance is proved by an experience of Mr. Ralston, at Lagg, where two dry top-dressings of guano were followed by but two cuttings in the year—while with the liquid—some 5000 or 6000 gallons per acre, repeated twice or thrice after each cutting, four cuttings were obtained; and, as Mr. Ralston put it, the Grass grew 12 feet in length during the season.

(General Conclusions.)

Now, I do not wish to hold up the practice of these Ayrshire farmers as a foil or contrast to that prevailing anywhere else. There is many an illustration of the enterprise and energy of our common Saxon blood to be found, not only on individual farms but over whole districts and even counties, both in England and in Scotland. These instances of successful cultivation of Italian Rye-grass are to be taken as independent histories; not for the purpose of putting any other practice in the shade—not for the purpose of comparison or contrast at all—but simply for consideration on their own merits. I have not given the cost of laying down the pipes, and pumps, and tanks—that varies with the cost of iron, and with fifty other things; and one man's experience is not necessarily another's in another place and at another time: and it is not likely that any person determining to enter on this plan will do so without personal inquiry into this aspect of the subject. All I have tried to do is to show that an enormous stock per acre is kept upon Italian Rye-grass cultivated in this manner—so large a stock that I think I have given good reasons why any tenant farmer with an interest in his land secured to him long enough to render an outlay of the kind required prudent, should go North and inquire into these facts for himself. I believe they may be parallelled in the neighbourhood of London with even greater profit than is reaped by Mr. Telfer in the neighbourhood of Ayr. The original character of the land seems to be of little importance. Mr. Bell, of Enterkine, has pipes under 40 acres of what is there called stiff clay land, and I was told that he believes he cut 100 tons of Rye-grass per Scotch acre last year. Mr. Telfer, on the other hand, grows his great produce on the lightest sand. The great advantage of the plant is this, as Mr. Telfer puts it: that you get a rapid certain growth when placed in favourable circumstances as to liquid manure: that there is a much longer time during which it is palateable for stock (for it is longer of getting dry and woody than any other Rye-grass); and that any soil with ammonia-and-water-retaining powers can be made to produce as large returns as the richest and most easily managed soils. If any one shall consider it worth his while to inquire further into the practice prevalent at Myremill, Lagg, and Cunning Park, it may be an encouragement to him to say that I found Mr. Kennedy, Mr. Ralston, and Mr. Telfer as cordially frank, and ready to meet my many questions as I could possibly have wished—as "ready to do good and to communicate" as any men I ever met.

It may be right to add a word or two on the hay made from this plant. It is of course, under its ordinary management, as proper for conversion into hay as any other Rye-grass—more proper if excellence for this purpose depends upon abundant produce of palateable food. But under the irrigation system, where the second cutting follows so quickly on the first—where such very heavy, almost unmanageable, produce is obtained, and, above all, where the success of the management depends upon the land being flooded with liquid immediately upon its being cut, it is not advisable to make hay. Hay is made from it, then, only in such cases as that described by Mr. Telfer, when a cutting of the old Grass remains unfinished, while the first cutting of the new is ready—or whenever the growth accidentally or by mismanagement overtakes the consumption. Then that which cannot be consumed at once is cut and made into hay—and very good hay it makes. You will perhaps expect that when speaking about hay, I should make some reference to Mr. Telfer's hay crop about which he spoke to Mr. Caird and me at Mr. Mechi's—and to the consequent statement which produced so much excitement then and subsequently. I am not, however, going to do anything of the kind. I submit that if any one shall insist upon investigating that, and ascertaining here and now what the exact nature of the statement was, and who is responsible for it, he will, for the sake of mere idle curiosity, be doing his best to destroy the usefulness of the discussion which may follow this paper; for the angry feeling which has thus been raised, and probably would be so again, is not the best in which to arrive at truth: and I hope that the London Farmers' Club will by their resolution this evening affirm the importance of the Italian Rye-grass as a forage plant, especially for use in the green state for feeding cattle. I hope too that they will recommend its cultivators to inquire, with a view to imitation, into the method of management adopted on the Ayrshire farms to which I have referred.

One further remark in conclusion:—It is but a century since men lived on salted meat alone during the winter months; the summer season was the only time when stock was fed or could be fattened; the introduction of the Turnip husbandry has changed all that, so that on many an arable farm more food is now provided during the winter months than there is for them during the summer, especially during the early part of it. The growth of Rye has been recommended as the remedy for this, and winter Vetches, Cabbage, Rape, and early Turnips are the crops which have been used to supplement the deficiency of the summer produce. I believe there is no plan so efficient for this purpose as the growth of a few acres of Italian Rye-grass, under irrigation, near the steading. Eight or ten acres of it, under the liquid manure system, will yield an enormous produce of it, and the manure that can be made by its consumption

will be a welcome addition to the powers of the farmer in the autumn cultivation of his stubbles for the green crop of the following year.

Home Correspondence.

Lands Improvement Companies.—Will you permit me to inform the readers of your widely-circulated Journal that the present rate of rent-charge of the Lands' Improvement Company, to repay a loan (capital and interest) in 25 years, is not 6*l.* 17*s.* 6*d.* per cent. per annum, as stated by Mr. Bailey Denton in his letter of the 28th February. The present rate of the company is 6*l.* 15*s.* per cent. per annum. With regard to Mr. Denton's remarks on the great advantages offered to landowners by the General Land Drainage Company, by a charge of 5*l.* 2*s.* 10*d.* per cent. per annum for 50 years, as compared with the charge of 6*l.* 15*s.* per cent. per annum for 25 years, by the Lands' Improvement Company, will you allow me to lay before your readers a very short calculation, showing the exact sum which would be paid by the inheritance or lands improved, for the outlay of 100*l.*, in improvements, in either case :—

	Years.	Rate.	
General Land Drainage Company,	50 ×	£5 2 10 =	£257 1 8
Lands Improvement Company,	25 ×	6 15 0 =	168 15 0
Difference			£ 88 6 8

It thus appears that there would be a saving to the landowner and the inheritance, by the Lands' Improvement Company's rate, of 88*l.* 6*s.* 8*d.* upon the outlay of every 100*l.* on improvements. These figures require no further comment on my part. *William Napier.* [It is only fair, however, to add a word of comment from ourselves. The real comparison is not to be effected by adding up, as if it were a payment now, all that each company demands every year during a course of years before its claim is satisfied; but by addding up now the *present value* of that claim in each year of the series during which the claim is standing. The question simply is, whether 100*l.* is procured on cheaper terms by paying for it an annuity of 6*l.* 15*s.* for 25 years, or by paying an annuity of 5*l.* 2*s.* 10*d.* for 50 years?—and it can be answered by a reference to the first ready reckoner that comes to hand.]

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

MONTHLY COUNCIL, *March 7*; Mr. MILES, M.P., President, in the chair.

Edward Warner, Esq., M.P., of Grosvenor Place, London, and Higham Hall, Essex, was elected a Governor of the Society; twenty-nine new members were also elected.

FINANCES.—Mr. Raymond Barker, Chairman of the Finance Committee, presented the monthly report on the accounts, from which it appeared that the current cash balance in the hands of the Bankers was 3241*l.* He also laid before the Council the report of the House Committee.

JOURNAL.—Sir John Johnstone presented the report of the Journal Committee, detailing the advanced progress made in the preparation of the ensuing July number; their recommendation of remuneration for surveys and researches connected with some of the papers, and their suggestion, the names of Sir Stafford Northcote and Mr. Dyke Acland should be added to the list of the committee.

AGRICULTURAL CHEMISTRY.—Sir John Johnstone also laid before the Council the report of the Chemical Committee, which embraced the following subjects :—

The rapid increase in the number of analyses made, at a reduced charge, in the laboratory of Professor Way, the consulting chemist to the Society, for its members, the number in the last year being more than double that in the preceding one; Professor Way remarking on this point that the result was gratifying, both as an indication of the extending application of artificial manures, and as furnishing unmistakable evidence of the increased confidence of the agricultural public in the decisions of chemical analysis.

Prof. Way's statement that the high price and increased demand for guano, during the last year, had led to more than its usual amount of adulteration; also, that the use of superphosphate of lime was becoming year by year more general; and a greater amount of skill and capital devoted to its manufacture.

The progress made by Prof. Way in the examination of those conditions of soils, on which their peculiar management and adaptation for particular manures may eventually be found to depend.

Incidental investigations made by the consulting chemist: 1. Of samples of supposed alkaline specimens of Nitrate of Soda, and of the Salts from the Nitre-beds of Mexico, along with instructions for recognising the alkaline Nitrates made for the Foreign Office; 2. Specimens of genuine Guano, and simple rules for testing the value of deposits, prepared at the request of the Admiralty, for the use of Naval Officers in their research for Guano; 3. Examination of Stothert's Manure, made at the request of Viscount Palmerston, for his information as Secretary of State for the Home Department; 4. Analysis of Poisonous Oil-cake, made at the request of the Council of the Society.

The direction of the committee to Prof. Way, that he would, as the consulting chemist of the Society, investigate the nature and effects of the atmosphere upon soils, with a view to the publication of a paper on that subject in the Journal, if approved by the Journal Committee; and that on Wednesday, the 18th of April next, at 12 o'clock, he be prepared to deliver a lecture before the members in the Council-room of the Society, "On the recent researches on the composition of the atmosphere in relation to vegetation." Other lectures for the season will be announced, when their subjects and the arrangements for their delivery shall have been decided upon by the committee.

The removal of Prof. Way's Laboratory from Holles Street, No. 15, Welbeck Street, where greater facilities will be obtained for carrying out his operations as consulting chemist of the Society.

The Committee's consideration of Mr. Bethell's suggestion, as referred to them by the Weekly Council, held on the 28th of February; and their request to Prof. Way that he will draw up, for publication in the Journal, a tabulated statement of the analyses of the different manures, both natural and artificial, having regard to the normal and average composition, and value of the ingredients, taking as a standard the analysis of guano, published in the Society's Journal, vol. x., p. 224.

GUANO-SUPPLY.—The President reported the continued influx of communications from the Foreign-office, on the extensive researches undertaken by direction of the Earl of Clarendon for deposits of guano and the nitrates, and transmitted to the Society by Lord Wodehouse.

JUDGES' AWARDS.—On the motion of Mr. Fisher Hobbs, the following resolution, of which Mr. Milward had given notice, was carried; namely—"That a Reserve-number be given by the Judges in each class of Live Stock."

AGES OF PIGS.—On the motion of Mr. Fisher Hobbs, the following resolution, of which Mr. Brandreth Gibbs had given notice, was carried (and a committee appointed accordingly), namely :—"That a special committee be appointed, to recommend some conditions in order to ensure the ages of pigs exhibited at the Society's Shows being correctly returned in the entries."

ESSAYS AND REPORTS received in competition for the Prizes of the Society in that department for the current year, were referred to the Journal Committee for adjudication.

His Excellency the Baron de Cetto presented a collection of works on the part of the Royal Bavarian Agricultural Society at Munich. The New York State Agricultural Society transmitted the last volume of their transactions. The Count de Gourcy presented his agricultural "Promenades," "Itinéraire," and "Voyage," in England, Central France, and other continental districts. M. B. Vicuna Mackenna sent his agricultural account of Chili. The Association for Promoting Improvement in the Dwellings and Domestic Condition of Agricultural Labourers in Scotland presented copies of their first Annual Report. Prof. Simonds, on the part of himself and Prof. Morton, as the joint editors of the new series of the "Veterinarian," laid copies of that work before the Council. Mr. Cuthbert Johnson transmitted a copy of his paper on the Application of Sewage to Agricultural Purposes.—The Council ordered their usual acknowledgments for these and other presents made to the Society.

Adjourned to Wednesday, March 14.

SOCIETY OF ARTS, *March 7th.—On the Sewage of London.*—Mr. Lawes read a paper on this subject, which is fully reported in the Journal of the Society, from which we make the following extracts :—

Whoever undertakes to bring forward plans for the economical disposal of the sewage of the metropolis, is at once met by the difficulty arising from the enormous bulk of the material with which he has to deal. It is estimated, that between 100 and 200 million tons of fluid pass through the sewers annually; and it is said that solid matter, amounting to nearly 200,000 tons, is suspended or dissolved in this liquid. Those who advocate the employment of the sewage by irrigation, must therefore seek for an extensive tract of land at no great distance from London on which to deposit this fluid; whilst those who propose to separate from it a solid manure must produce a substance of sufficient productive value to bear the cost of carriage to all parts of Great Britain. Of late years much money has been uselessly expended in patents and inventions for converting the sewage into a portable manure, which might have been saved by a better knowledge of the true principles of manuring, and the wants of agriculture. It should never be forgotten that it is the cost of carriage which regulates in a great measure the distribution of manures, and assigns to each a limit of area, beyond which it cannot profitably be employed. No one doubts the value of stable manure; yet its use is confined to a range which does not exceed a few shillings per ton for carriage; and a farmer who would have to cart it beyond this range would not accept it as a gift; and it is for a similar reason, that even if the manufacture of a solid manure from the sewage of a small town could be carried on with profit, it might still be quite impracticable as applied to London.

[The first part of the paper, to which we shall hereafter refer, related to the nature of manure and the elements of *value* in connection with it. Mr. Lawes then went on to apply these principles to sewage].

Assuming as we may do for all practical purposes, that the great bulk of the excrements of horses, cows, &c., in the metropolis, will not find its way in the sewers—that the refuse of manufactures valuable as manure which will do so will be comparatively limited—and that the matter abraded from the street with their small admixture of the excrements of horses and other animals, will also be of comparatively little value—we recur to human excrements as the main items to be taken into calculation. The questions arise, then, upon what data can we fairly estimate the amount and the chemical composition of the excrements of the total population of London? In what condition of solidity or solubility will these constituents be found, and through what bulk of sewage will they be distributed? What would be the actual value of the constituents if separated from their admixture with water? And finally, what are the most promising means of turning these constituents to economical accounts in the state of solution and dilution in which we find them? It might, perhaps, appear at first sight, that the most feasible way of estimating what constituents enter the sewers would be to analyse the sewer water itself; but when we come to consider the very small average proportion which the valuable ingredients bear to the bulk of the water, and also the necessary irregularity of their admixture with it at different times and places, this is found to be by no means the case.

[An immense mass of facts on the ultimate purposes served by food, and on the dietaries of various ages and classes of people, was then given in a series of tables, and the following is the use made of them.]

In applying the results of these tables to elucidate our main question, namely, the composition of the excrements of the population of London, the latter is taken at 2½ millions; and this number is supposed to comprise males and females of various ages in the proportions given in the last census. It has next been assumed that all males under 15 years consume the amounts of carbon and nitrogen given in the dietary table for males under that age, in schools, in public establishments of boys, in prisons, in work-houses, &c., and in many cases of individual experiment. The various classes of males over 15 in the metropolis are supposed to be represented, so far as the carbon and nitrogen they consumed is concerned, by the average of sailors, of soldiers, and pensioners, of prisoners with labour, of prisoners without labour, of men in workhouses, in infirmaries, as well as of certain individual cases of direct experiment. And again, the average given in the table of children in workhouses under 16 years, and of girls in various asylums and public establishments, &c., is applied to the female inhabitants under 15 years. That, on the other hand, given of women in workhouses, in prisons with and without labour, with soldiers embarked, and of a case of individual experiment, is supposed to apply to the adult female population. There are also given the calculated dietaries of several families and other establishments, of mixed ages and sexes, of different grades of society, the results of which fully confirm the indications of those of the other classes, and at the same time justify the appropriation, for our present purpose, of the figures given for the various classes in the manner above-mentioned. The average thus taken of the amounts of carbon and nitrogen consumed per head per day for each of the divisions as to sex and age, is multiplied by the number of individuals of each such divisions, and the figures thus obtained for the several divisions being added together, we obtain, of course, the amounts of carbon and of nitrogen consumed by the total population in one day; and from this is easily ascertained the annual consumption. Before leaving the question of the amount of the constituents consumed in food, it may be well to notice a point of some national interest and importance, which the calculation of the various dietaries may help to elucidate, namely, the probable average consumption of Wheat by each individual of the population. This has been variously estimated at from 6 to 8 bushels per head per annum. The amounts of bread, flour, &c., registered in the dietaries, which have been calculated, lead to the conclusion that 6½ to 6¾ bushels is about the average amount so consumed. Another point illustrated by the calculations is, that the average quantity of the dry substance of food—that is, excluding the water it naturally contained—is, within a very small fraction, one pound per head per day, including both sexes and all ages.

[The waste by respiration, perspiration, growth, &c., ascertained in great detail is then deducted from the food consumed, and the remainder finds its way into the sewers. The main results are given as follows.]

After this full discussion of the nature of the evidence at command for the estimation of the composition of the excrements of a large mixed population, let us see what are the results to which it has brought us :—

Estimated Constituents of the Human Excrements of London.

Constituents.	Ounces per head per day. Average of both sexes and all ages.	Pounds per head per annum. Average of both sexes and all ages	Tons per Annum. Total for both sexes and all ages.
Total dry substance ...	2·01	45·95	51,286¾
Mineral matter	0·45	10·34	11,536¾
Carbon	0·74	16·85	18,809¼
Nitrogen	0·35	7·94	8,859¾
Nitrogen=ammonia ..	0·42	9·64	10,758¼
Phosphates	0·20	4·58	5,108

The average amount of real dry substance voided in the excrements of each individual of the population in 24 hours, is thus seen to be only 2 ounces; or equal to about 46 lbs. per annum. This 2 ounces of dry substance will contain rather less than half an ounce of mineral matters, and the annual amount of these per head will be about 10½ lbs.; and about two-fifths of the mineral matters voided, or about one-tenth of the total dry substance will be phosphates. Of carbon in the excrements, there is about three-quarters of an ounce per head per day, equal to about 17 lbs. per annum. Of the valuable constituent nitrogen, there is an average of rather more than one-third of an ounce per day, or about 8 lbs. per annum; and these amounts of nitrogen are equal to .42 of an ounce per day, and nearly 10 lbs. per annum of ammonia. The amount of the constituents voided by the total population in one year, if entirely freed from water, is seen to be 51,286¾ tons. Of this about one-fifth is mineral matter; and the nitrogen it contains amounts to about one-sixth of the whole, namely, 8859¾ tons, which is equal to 10,758¼ tons of ammonia. Now little more than ½ a cwt. of ammonia is the usual artificial dressing for an acre of cereal grain, and it might be calculated to yield an increase of crop

of 10 to 12 bushels of Wheat, or this 10,758½ tons of ammonia would afford a produce of about 600,000 qrs., if it could be conveniently applied for such a purpose. The intrinsic value of the sewage of London considered in this merely chemical point of view is therefore enormous. Indeed, according to the above supposition, it would return to the metropolis nearly one-third of the Wheat consumed by its population. If, however, it were thus devoted exclusively to the growth of corn, it would, at the rate above mentioned, extend over more than 400,000 acres of land. But this ammonia in the sewage of London is unfortunately distributed through an enormous bulk of water, and Mr. Wickstead has shown us how immense would be the cost of distributing this material over an enormous area of land in the liquid form.

[Mr. Wickstead's method of treating sewage manure and other methods of extracting its value in the solid form are then discussed. We shall refer to this hereafter.]

Considering the profitable manufacture of a solid sewage manure quite impracticable with our present knowledge, I now turn to the question of the employment of sewage in the liquid form by irrigation. With regard to what is, probably, the amount of fluid that would have to be disposed of, in dealing with London sewage, I will say a few words. By a return presented to the Houses of Parliament last July, it appears that the water delivered into the metropolis by the nine water companies gives an average of from 24 to 25 gallons per head per day on a population of 2½ millions. I find, also, that the average fall of rain over the area supplied by the water companies will give almost exactly a similar amount per head, namely, between 24 and 25 gallons. The supply of the companies and the rain-fall taken together, therefore, give a gross amount of nearly 50 gallons per head per day. But, from this a considerable portion must be deducted for evaporation. I am inclined to think that, by the time any comprehensive scheme for the disposal of the London sewage can be brought into operation it will not amount to much less than 50 gallons per day for each individual of the population. Fifty gallons per head per day would amount to 81½ tons per head per annum; and, as it has been seen that the dry substance of the excrements of one individual is 46 lbs. per annum, it follows that a ton of sewage would only contain 9 ounces of these excrementitious matters. In conclusion, there can be little doubt that if the sewage of London is to be turned to some useful purpose, it must be applied in the liquid form in such quantities as to yield the greatest possible growth that land and season are capable of. And, certainly the enormous amounts of produce of Rye grass which have lately been recorded as the produce of irrigation—and which there is no reason to doubt—were never obtained by such small amounts of liquid as the late Mr. Smith, of Deanston, supposed sufficient. For corn crops, an enormous supply of liquid manure is certainly not well suited, for the influence of season fixes an easily reached limit to the produce of grain, the gross value of which cannot much exceed 12*l.* or 14*l.* per acre. For market gardens, again, liquid sewage does not seem well adapted, as with its use the surface of the land is liable to become crusted, which is injurious in the growth of the vegetables. There is, however, another objection to any extensive application of sewage to this purpose, in the unlimited amount of good stable manure which is easily carried back by the carts which convey the produce to London. It could, moreover, be easily shown that the dung which was so comparatively inefficient a manure for the growth of Wheat is, nevertheless, peculiarly adapted for the production of vegetables. I return, therefore, to Grass, as the most suitable crop for the application of liquid sewage. But that its use, even for this purpose, should be attended with advantage, it must, as I said before, be employed in the most liberal quantities that the capabilities of land and season will admit of; and, in this way, it is not impossible that in the neighbourhood of a large city a rental of 20*l.* to 30*l.* per acre might be obtained. Experience alone can decide what is the minimum area of land which would yield the maximum produce and rental from the sewage of London, but there can be little doubt that it would require many thousand tons of sewage per acre to yield the rental I have supposed. I may mention, however, that if 10,000 tons of sewage were annually applied to each acre, it would take about 20,000 acres to absorb the whole sewage of London, upon the estimate of 50 gallons per head per day. But it is even possible that so far as the quantity of liquid is concerned the area might be reduced below that which is here assumed. It will be said, perhaps, that such an amount of sewage is much more than would be usefully applied in furthering growth, or even that it would be wasteful or injurious. The point, however, to which I wish particularly to call attention is, that up to the limit at which either the amount of liquid or of manurial constituents becomes positively injurious, an apparent extravagant supply of ingredients on a limited area of land will, there is little doubt, yield a more profitable result than a saving of manure with a more extended area. There would surely be no great difficulty in appropriating a few thousand acres at no great distance from the Thames to the purpose in question. And Grass being the produce grown, so milk and cream should be the chief products obtained in return. Irrigated Grass appears to supply food peculiarly adapted for the production of milk; and there are certainly few articles with which the inhabitants of the metropolis are so inadequately supplied. Whilst, therefore, they must be justly charged for the removal of the sewage on sanitary grounds, they might surely demand that the cost might be lessened by a proper application of the sewage; and it appears to me, that a liberal distribution of it on Grass is the most promising means of obtaining this result.

Notices of Books.

Farming Essays. (Third Series.) By Hewitt Davis, Land Agent, &c., 3, Frederick's Place, Old Jewry. Ridgway, London.

These essays, in this issue of them, reach No. 79, commencing with 53. Mr. Davis has here contributed 27 of his very lucid, useful, and interesting papers on agricultural subjects. A large agricultural experience, extensive general knowledge, and a plain and pleasant style in the relation of both, combine to make Mr. Davis one of the most attractive and instructive of our agricultural writers.

Calendar of Operations.

MARCH.

Berwickshire Merse Farm, *March* 5.—At length have we reached the close of a protracted snow storm. During six weeks but little progress has been made in agricultural operations. The spring like opening of the new year gave place, about the middle of January, to weather of a more seasonable character. Showers of soft snow and frosty nights were the forerunners of a storm, and on the 23d it lay white and hard. The ploughs being stopped, we embraced this opportunity for forming dung-heaps on the break intended for Turnips, an operation to which but little had been previously done, owing to the fine weather. This operation, so much (and, in theory, so justly) condemned by some writers, is practically found indispensable to progress at Turnip time; for how could one find carts to convey afield all the dung from a heap in the steading (as recommended), in that busy season, without retarding the drilling to a serious extent? Surely the loss of ammonia will be more than counterbalanced by the advantage of seasonable sowing. A sudden thaw, which permitted ploughing on the 5th, 6th, and 7th ult., was followed by a return of the storm from north-east, and it snowed pretty constantly for a week—quite a "feeding" storm. The snow having now reached a uniform depth of a foot all over the country, we were visited by the most intense frost known here for many years past. At 11 P.M., on the night of the 15th, Fahrenheit's thermometer stood at +3°; and at the same hour next night it descended to 2° below zero; while during the day it ranged from 6° to 15°. It was fortunately very calm, but with a heavy hoar frost. At this temperature the streams were converted into sheets of strong ice: and water-wheels frozen up, though (of course) under cover. The stores of Turnips in field for sheep began latterly to fail; for less attention is paid to early storing for sheep than for cattle. The bulbs were so deeply covered with snow that it required all hands to obtain a supply for ewes and cutting to hogs; and that, not without much unavoidable destruction in the process of "picking." About the end of February, the snow showers changed to rain; and the present month was ushered in by a fine, fresh south-west wind, that has speedily discovered "black ground," save where a white stripe lies under the lee of a plantation or thick fence. Ploughs are again at work, after a month's rest, and have much to do yet in preparation for seed-time. Some will yet venture the Wheat destined to have been sown a month ago. Lea is not yet dry enough for the Oat seed, but will soon be so under this strong wind. The young Wheat plant is indebted to the deep snow for protection against the past severe frosts, and looks fresh and healthy, though not yet quite risen up. Pastures have acquired a fresh green beneath the snow, but little more as yet. The deficiency in the Turnip crop has enhanced the value of Linseed-cake and other artificial feeding. The first quality of Beans, at less than 9*l.* per ton, are surely cheaper than oilcake at 18*l.* Sheep have not improved much lately; but cattle, being well housed, have thriven. Among lambs there are few twins; but the single ones will be the sooner fat. Our regular lambing time commences next week. *J. T.*

Notices to Correspondents.

Ayrshire Cows: *F H.* We do not know the address of our correspondent "Clericus," and you have not given us your own, so that we cannot exchange the two.

Frosted Potatoes: *A Y.* If all the Potato be "slightly" affected it is useless for seed. If by "slightly" affected you mean that a part only of a Potato is affected, the sound piece cut off, if it has an "eye" in it, may, of course, be used as a "set."

General Book on Farming: *O M.* The editor of this paper is the editor of one of the works you allude to, and is therefore incompetent to decide between them.

Name of Grass: *W. Newton.* It is Timothy Grass—Phleum pratense. Eat it down: you can do it if you take it early enough; the stock are fond of it. It would be a loss to you to get rid of it.

Pig Feeding: *R H.* If we had a steaming apparatus on the farm we would not give store or fatting pigs *raw* Swedes and Mangolds. The steamed roots are less loosening in their effect on the bowels, chiefly because of the power you have of thoroughly mixing them up with drier material.

Poultry: *An Old Subscriber.* Spanish fowls are good layers; Cochins both lay and sit well, and are moreover excellent mothers. If you are likely to have a dirty or smoky run by all means keep dark-feathered fowls; so much depends upon the size and nature of the place where they are to be confined, that we hesitate to advise you until satisfied on this point. Cochins bear confinement well, and a very low fence suffices to keep them within bounds; Hamburghs, on the contrary, are more wild, and will fly a considerable distance. About five hens to one cock is the usual number we allow, but here, again, "breed" must be consulted; ten hens may be put with one "game" cock, whereas five to a "Dorking" cock would be the outside number. Eggs could not be expected to hatch well during the severe weather; make another attempt, and the chances are considerably in your favour. The price of Hamburgh fowls varies from 7*s.* to 20*s.* each; they are neat, pretty, and good layers. Look over the advertising columns, or send your address.

Short-horns: *Ignoramus.* H. J. Strafford, Esq., 13, Euston Square, editor of the "Herd Book."

Short-horn Calf: *Ravenwood.* We would recommend you to discontinue the medicine you have been giving, and let the animal have some Linseed gruel twice a day, with the following tonic:—Gentian powdered 4 drachms, Cascarilla bark 4 drachms, Ginger 2 drachms; to be mixed and divided into eight powders. *W. C. S.*

Wheat: *D O N.* Mix the two loads of fowls' dung with an equal quantity of earth, and apply the whole to your acre of Wheat: it will not be too much. Do it, if you can, during wet weather.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.

Canonmills Bridge, Edinburgh.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which RICHMOND AND CHANDLER have attained in the manufacture of Agricultural Implements; and the recent improvements made upon the various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated) give the highest value in the economical preparation of food for cattle.—Address RICHMOND & CHANDLER, Salford, Manchester, and South John Street, Liverpool. Catalogues gratis.

NEW FEEDING SYSTEM.—NO OTHER MACHINE BUT KEALY'S PATENT PRIZE ROOT PULPER prepares the Turnip or Root for Lambs, Mash Feeding, or Fermented Food, which method is attended with an immense saving in time and money. Its exposition at the Cattle Show has created an unprecedented demand.

KEALY & Co., 369, Oxford Street, London.

FREDERICK PHILLIPS' PATENT.

THE PRIZE PULPING MACHINE of the Royal Agricultural Society's Show, held at Lincoln, July, 1854.

Of all the Pulping Machines which are before the Public, this is the only one which the Royal Agricultural Society certifies as "breaking the roots well,"—all others are certified as sliced (see their *Journal*, just published, page 373, also in the article on "Diminishing the Quantity of Roots in Fattening Cattle," page 490), and the great braggadocia "No Other," advertised widely, although tried against that of F. P. and others, was not placed at all, in fact was "nowhere."

F. P. is happy to inform his numerous applicants for his Machine, that he has greatly simplified its construction without affecting its efficiency, and has reduced its price from 11*l.* to 7*l.* with Floor, and 6*l.* 10*s.* without boarded Floor.

Orders addressed to FREDERICK PHILLIPS, near Bramfield, Suffolk, promptly attended to.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 8*l.* 8*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SON, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farmers, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 18 0
2¾ „	long 3 „ 3 „		1 15 0
3 „	ditto 3 „ 6 „		2 12 0
3½ „	ditto 3 „ 6 „		2 18 0
4 „	ditto 3 „ 6 „		3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 18
2½ in. long	ditto	ditto ditto	2 15

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SON, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the prizes they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters addressed to the Works at Lincoln will have immediate attention, and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron Boilers, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

ESTABLISHED 1786.

WEST OF ENGLAND AGRICULTURAL AND HORTICULTURAL ESTABLISHMENT,

FOR THE SUPPLY OF EVERY REQUISITE FOR THE FARM AND GARDEN.

UNION ROAD, PLYMOUTH.

Under the Patronage of

HER MOST GRACIOUS MAJESTY THE QUEEN, HIS ROYAL HIGHNESS THE PRINCE OF WALES AND DUKE OF CORNWALL, HIS MAJESTY THE KING OF THE BELGIANS, HER IMPERIAL HIGHNESS THE DUCHESS OF BRABANT, HER ROYAL HIGHNESS THE DUCHESS OF ORLEANS, HIS EXCELLENCY THE NEPAULESE AMBASSADOR AND SUITE.

And upwards of two thousand of the leading aristocracy and principal families in Great Britain and Ireland.

WILLIAM E. RENDLE & CO.,

SEED MERCHANTS, PLYMOUTH,

BY SPECIAL APPOINTMENT TO THE SOUTH DEVON AGRICULTURAL ASSOCIATION, AND THE ROYAL AGRICULTURAL SOCIETY, PRINCE EDWARD'S ISLAND, SUPPLY ALL KINDS OF

SEEDS FOR THE FARM AND THE GARDEN.

CARRIAGE FREE, AS PER FOLLOWING SCALE:—

All Orders for Seeds above £1 (excepting heavy articles, as Grain, Tares, Clover, Seed Potatoes, &c., will be delivered Free of Carriage to any Railway Station between Plymouth and Paddington.

All Orders above £2, with the above exceptions, Free to any Station on the Broad Gauge Railways, or to any Market Town in Devon and Cornwall, or to Cork, Dublin, and Liverpool, by Steamers.

All Orders for Seeds above £5, with the above exceptions, will be delivered, Free of Carriage, to any Railway Station in England and Wales, and to any Steam Port in England, Wales, Scotland, and Ireland.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

Pelmont Farm, Eltham, Kent, August 28, 1854."

Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; we have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, 12 varieties, 2s. 6d.; and from good double sorts, 1s. Superior Quilled German and French Asters, in 12 varieties, 1s. per packet; separate, 2s. Fine Quilled African Marigolds 6d. per packet.—Saffron Walden Nurseries.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

ROSES.

GEORGE CLARKE begs to announce that he can still supply fine Standards of all the leading varieties, his selection, at 18s. per dozen. Also, fine strong dwarfs of Centuais, Bourbons, Tea scented, &c., 12s. per dozen. Well assorted collections of Evergreens, Fruit Trees, Coniferæ, and every article connected with the trade, at most moderate prices. Catalogues may be had on receipt of two postage stamps.—Nursery, Brixton Hill, near London.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing that he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great merit, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. Winstanley, Seedsman, 28, Market Place, Manchester, price 2s. 6d. per packet; prices to the trade on application.

HOPS SUPERSEDED BY THE BAVARIAN BITTER, a perfect substitute for Hops, of an agreeable flavour, quite soluble in wort or beer, saving the trouble of straining through a Hop-back, and giving to Beer the well-known keeping properties of the Bavarian Beer. Price of 1 packet, 2s. 8d., which is equal to 5 lbs. of best Hops.—Prepared only by THOMAS PRATT WILLS, St. George's Square, Portsea. Free per post.

SPLENDID IMPORTED GERMAN FLOWER SEEDS.

CHARLES PENNELL begs to offer to his patrons and the public, at reasonable prices, very superior and unrivalled collections of GERMAN SEEDS, comprising extra double German Bouquet Stocks, new large flowered; New Yellow and New Hybrid ditto. German Emperor, and the fine Autumnal and Winter Flowering varieties, &c. Extra double German Larkspurs, Salpiglossis, German Zinnias, in several fine varieties, Phlox Drummondi, and many other varieties too numerous to insert here, prices of which may be had on application.

C. P. takes this opportunity of announcing that owing to a three years' residence in different parts of Germany, including Prussia and Austria, he has been enabled by dint of great attention, to make one of the most superior selections of German Seeds ever before offered in England. He feels therefore the most unbounded confidence in offering the above to the public, being assured that they will afford the most ample satisfaction to all honouring him with their purchases.—Nurseries, Lincoln. Mar. 10.

BOX TREES.

MESSRS. E. G. HENDERSON AND SON, of the WELLINGTON NURSERY, St. John's Wood, having on hand a large stock of FINE BOX and LILAC TREES, beg to call the attention of parties engaged in laying out Cemeteries and Ornamental Grounds to the same, which they are willing to dispose of at very reduced prices.—March 10.

GENUINE SEEDS.

THE MEMBERS OF THE "SEED GROWERS SOCIETY," continue to supply genuine AGRICULTURAL, VEGETABLE and FLOWER SEEDS at Growers' prices. Lists with price and terms of business may be had on application to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex.

GRASS SEEDS, CLOVERS, ETC.

T. F. WINSTANLEY is now ready to send out his Mixture of New Grass Seeds, for Laying down New or for Renovating Old Pasture; finest Mixtures for Lawns, &c. For list of sorts and quantities, &c., see his Garden and Agricultural Seed List, to be had on application.

28, Market Place, Manchester.

PASTURE AND LAWN GRASSES.—Gentlemen laying down land as permanent Pasture, &c., or fine Lawns and Bowling Greens, may obtain SEEDS for the same, either mixed or separate, of DAWE, COTTRELL, and BENHAM (Successors to F. Warner), WHOLESALE SEEDSMEN, 3, Laurence Pountney Lane, and 36, Moorgate Street, London.

D., C., & B. also beg to call attention to their well-tested Stocks of Mangold Wurzel, Swede, and other Turnips, &c. Descriptive Catalogues of Horticultural, Agricultural, and Garden Seeds on application. Fluke, early Shaw, Clark's Seedling, new early Bermuda, Red Ash-leaved, and many other kinds of Potatoes for sets. (Established at 28, Cornhill, 1750.)

TO BE SOLD, Bishop's last and best PEA, 10 to 15 quarters at 56s. per quarter, and 7 to 8 quarters of a superior BLUE PEA, capital boiler, or an abundant bearer for podding, 56s. per quarter; also a quantity of genuine Skirving's Swede Seed of last year's growth, grown from large roots; transplanted and other sorts of Turnips and Mangold Seeds, &c. —Apply to Mr. GEORGE TABER, Seed Grower, Rivenhall, Witham, Essex. Delivered carriage free. Terms cash.

A CHALLENGE TO ALL ENGLAND.

A GREAT BARGAIN IS NOW OFFERED TO THE PUBLIC.

TO BE SOLD, at 5s each, 100 Prime Dwarf-trained CHAMPION PEACH TREES, surpassing every other kind in size and flavour, and more hardy, having been raised in England. Also a large quantity of Dwarf-trained FLEMISH PEARS, and all the best kinds of APPLES, &c., at low prices. —Agents, Messrs. HURST & Co., 6, Leadenhall Street, London. T. HUTCHING, Manager, Great Nurseries, Axminster.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz.:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Raby Castle. Also a quantity of strong dwarf-trained Pears and Plums of the best sorts, Fastolff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes, well kept, of the best sorts.—For further particulars apply to JAMES LAKE, Nurseryman, Bridgewater.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane Cannon Street, City, and the Royal Mills, Wandsworth, Surrey and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

TO GARDENERS AND OTHERS.

THE BRIDGEWATER FIRE AND WATER-PROOF MINERAL PAINT.—An Important Discovery.

This substance is a vein of earth found only in one of the Bridgewater Mountains of New Jersey, in the United States. It is the most extraordinary paint offered to the public, possessing new and valuable properties, and applicable to a variety of purposes. Its colour is dark red, never fading or changing in the hottest climates. When mixed with any other paint, the colour produced by that mixture will be rendered unfading also. After it has been applied and exposed to the atmosphere a few months, it becomes fireproof, and as durable as stone. Wherever it is applied neither rain, sea-water, nor damp can penetrate; thus preserving iron from rusting, wood from rotting, and brickwork from damp. It will endure intense heat without cracking or blistering. It has also the property of flexibility; Canvas, Tents, &c., covered with it become waterproof, retain their previous flexibility, and are not liable to crack when they are rolled up. Coarse Wrappers, covered with two coats of it, are an excellent substitute for Russian mats, to cover gardeners' pits and frames, or to protect wall fruit trees, being cheaper and more durable. If two coats of it be applied to trees, above and below the ground, where the borer generally enters, it will prevent the attack of that destructive grub, or insects of any kind; a new bark will be formed under the paint and the trees kept in a healthy condition. It is spread out easily, and does not emit any unhealthy effluvium.

A specimen of the paint on coarse wrappers for Gardeners and others may be seen at J. Le Cren's, House-painter, 26, Moorgate Street, who undertakes to supply Gardeners and the public with any quantity of painted wrappers at moderate prices.

Sole Consignee for the United Kingdom, JOHN EIVES, 17, Cornhill, London. Sold by Agents in most of the principal towns of the United Kingdom. In London by L. FRANK & SON, Oil Merchants, 14, Borough, London Bridge, of whom may be had Quick Drying Oil to mix with it, for use during the winter season, and also Testimonials in its favour from Shipowners, Builders, Painters, &c.

GLASS.

THOMAS MILLINGTON, Importer of Foreign Sheet Glass, requests attention to the present Prices of Glass and Stock sizes, which are cheaper and better than those of English manufacture:—

PACKED IN ONE HUNDRED FEET BOXES, THIRDS QUALITY, BOXES INCLUDED.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

NEW AND IMPORTANT LEVELLING INSTRUMENT.

GILLESPIE'S PATENT INCLINOMETER for Taking, Fixing, and Adjusting Surface Slopes of Land, Earthen Embankments, Railway Gradients, &c., and the Fall, Outfall, or Rise of Drains, Water Courses, &c., and universally applicable to determine the plans and aid the execution of all levelling or sloping operations known in civil engineering.

PRICES:—Inclinometer, with mahogany frame and brass mounting £3 3 0
Do. with oak frame and wrought iron mounting £2 12 0
Light Telescope, 10*s.* 6*d.* extra.

TESTIMONIALS.

From Mr. James Gentles, Contractor.—"I have for a considerable time past used Gillespie's Patent Inclinometer in extensive drainage operations carried on by me, and I have found it to be of the greatest service, in showing the minutes on the ground, and in saving of labour; and I could not have constructed many of the drains with any degree of accuracy without its assistance."—James Gentles, Hart Hill, by Whitburn.

Extract of a letter from John Mitchell, Esq., Stand Hill, Rochdale.—"I highly appreciate its capabilities as a levelling instrument. In level lands, where there is a difficulty in determining which direction the land slopes, it is invaluable."

Extract of a letter from Mr. John Turner, Surveyor, Wakefield.—"The more I have tested it the more have I appreciated its value. By this invention the power of levelling is brought within the reach of all men of ordinary capacity."

Sold by WILLIAM DRAY & Co., Engineers, &c., Swan Yard, London. Specimens and Models may be seen at their Warehouse. Also a Descriptive Treatise on the nature and uses of the Patent Inclinometer, and copies of Recommendations of its official value to be had on application.

TO MANURE MAKERS AND FARMERS.

SULPHATE OR MURIATE OF AMMONIA.—These powerful fertilisers, genuine as manufactured, may be had in any quantities from READ HOLLIDAY, Ammonia and Soda Works, Huddersfield.

WILLIAM DRAY & Co., Manufacturers, Swan Lane, Upper Thames Street, near London Bridge.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.

NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.

Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.

JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, few doors east of the Pantheon.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE. IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility: are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Lamps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4*s.* 6*d.* each; Four Tine Forks, 5*s.* 6*d.* each. A liberal allowance on Wholesale Orders.

WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.—Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air more effectually, in conjunction with SANGSTER'S FLORUMBRA, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.—Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

PAGE AND CO.'S BLIGHT COMPOSITION.—The above should be in the hands of all Plant and Fruit Growers. For testimonials, see *Gard. Chron.*, March 3, 1855.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

HOLLOWAY'S PILLS THE FAR-FAMED REMEDY FOR VARIOUS COMPLAINTS.—In all cases of deranged Stomach, Indigestion, Bile, Sick Headache, Liver Complaint, or determination of blood to the head, there is no medicine known equal to these wonderful Pills that will so quickly alleviate and ultimately cure persons suffering from disorders of this nature; the peculiar properties they possess act on the very main springs of life, so that such diseases are sure to yield to their influence, therefore those who are so indisposed should have recourse to Holloway's Pills, which will effectually check every symptom and restore the patient to the soundest health.—Sold by all Medicine Vendors, and at Professor HOLLOWAY'S Establishment, 244, Strand, London; and 80, Maiden Lane, New York.

TESTIMONIAL.—The following Testimonial of the valuable efficacy of CUPISS'S CONSTITUTION BALLS is so excellent that the proprietor begs to call the attention of the public to a perusal of it.

"Combs, Stowmarket, October 25th, 1850.

"DEAR SIR,—Having for two years past experienced great trial with the lung complaint in my neat stock, last year having lost five out of seven, I employed an old experienced veterinary surgeon, with little or no success. The two cases saved I believe to be from the use of blisters on each side of the chest, and CUPISS'S CONSTITUTION BALLS, which you recommended; and this year having two cases of the same disease, quite as bad as the others, I adopted the same means of cure, and am happy to state with success, having saved them both. I cannot speak too highly of the use of the Balls; I believe them to be as good for neat cattle as for horses. I think this statement of importance to Agriculturalists, and as Agent for CUPISS'S Constitution Balls, you are at liberty to make use of the above information as you may deem fit.—Yours faithfully, "JOHN COBBOLD.

"To Mr. J. B. CUTTING, Chemist, &c., Stowmarket."

The Constitution Balls are prepared only by FRANCIS CUPISS, M.R.C.V.S., Author of the "Prize Essay on the Diseases of the Liver of the Horse," Diss, Norfolk; and sold by all respectable medicine vendors in town and country, in packets, six Balls each, 3*s.* 6*d.* per packet, with a wrapper giving full directions for the use of the Balls, and treatment of the animal whilst taking them. Any gentleman using the Balls may consult the Proprietor gratuitously, either personally or by letter post paid.

SUPERIOR FIRST CLASS CABINET AND UPHOLSTERY FURNITURE can only be obtained at moderate prices by purchasing direct from the manufacturer, thus saving the profit of the middle man, and securing thoroughly seasoned materials with soundness of workmanship, and an elegance of style not to be found at other houses. Families furnishing are respectfully solicited to inspect the extensive stock of Cabinet Furniture, Bedsteads, and Bedding, at JOHN VOLLUM'S old established manufactory, No. 3, Finsbury Pavement. Designs and Estimates made for furnishing a house or single room in any part of the country free of charge. No charge made for packing country orders. Observe—No. 3, Finsbury Pavement, London, and the name most distinctly JOHN VOLLUM.

CLOTH REVIVER.—TO CLERGYMEN AND OTHER WEARERS OF BLACK CLOTHES.—To make two suits of Clothes last as long as three. On the receipt of 13 Postage Stamps the Advertiser will forward practicable directions for Cleaning and Reviving Cloth or other clothing material of any colour to look equal to new—easily made up—used with very little trouble, and perfectly clean and soilless in its application.—W. C., at Mr. Henry Bond's, Bishop's Castle, Shrewsbury.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

LADIES' HEADDRESSES.—Whatever may be attempted in the production of the most elegant Ladies' Headdresses, whether designed by the highest taste, or executed by the most undoubted skill, must fail in the accomplishment if the roots of the hair have lost their proper tone and firmness, one of the common causes of lank and weak hair, or if the hair itself has begun to decay or fall off in patches. The certainty and facility with which these defects are obviated by OLDRIDGE'S BALM of COLUMBIA, from its nourishing and bracing qualities, have long obtained for it that extensive reputation which it is so well known to possess. The first application causes the hair to curl beautifully, frees it from scurf, and stops it from falling off, and a few bottles generally restore it again. Price 3s. 6d., 6s., and 11s. per bottle. Sold retail by the proprietors, 13, Wellington Street, North Strand.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package (elegantly perfumed,; sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.

PARR'S LIFE PILLS are composed of simple but powerful curative ingredients. They are so mild and excellent in their action that a child may take them. For bilious disorders, liver complaints, indigestion, costiveness, sick headache, depression of spirits, pains in the back, gravel, and lumbago, PARR'S LIFE PILLS will be found a safe and admirable remedy. Invalids should make an immediate trial of this excellent, long-tried, and successful medicine.—Ask for PARR'S LIFE PILLS.—Sold by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, Farringdon Street; Sutton & Co., Bow Churchyard; Hannay & Co., 63, and Sanger, 150, Oxford Street, London; and by all respectable chemists and medicine vendors in town or country.—In boxes price 1s. 1½d., 2s. 9d., and in family packets 11s. each.

Now ready,

THE FERNS OF GREAT BRITAIN, illustrated by JOHN E. SOWERBY; the descriptions, synonyms, &c., by C. JOHNSON, Esq. In 1 Vol., cloth boards, containing 49 plates, full coloured, 27s.; partly coloured, 14s. Also Part VIII., completing the work, price 5s. full, and 2s. 6d. partly coloured.
JOHN E. SOWERBY, 3, Mead Place, Lambeth, London.

In 2 vols. 8vo, price 28s. cloth lettered.

THOMAS'S MODERN PRACTICE OF PHYSIC: Exhibiting the Symptoms, Causes, Prognostics, Morbid Appearances, and Treatment of the Diseases of All Climates. London: LONGMAN, BROWN, GREEN, & LONGMANS.

Second Edition, enlarged, in fcp. 8vo, price 5s. 6d.

THE CHOICE AND COOKERY OF FISH: a Practical Treatise. By PISCATOR.
"This is one of the most useful volumes of the kind ever issued. We find in it concise and lucid directions, both as regards the selection of fish and the dressing of it. Now, these two subjects have often been treated by various writers, but we have never met with a work so thoroughly clear on the matters of fact, nor so mentally pleasing in the rendering of those matters of fact. Piscator not only enlivens with culinary tactics, but he interests with a graphic sufficiency of natural history relative to fish. With the salmon and the sprat, the mackerel and the mussel, the conger and the crab, the turbot and the tench, he is equally at home. He seems to be cognisant of all processes between the shoal in the fishing-boat and the sauce in the butter-boat. He can tell you the best management of a white shark and the most delicate condiment for a red herring. We beg to say that the ladies of our household are so satisfied with Piscator's agreeable and sensible edification that the volume has been appropriated by them, and on the warrant of this we cordially commend the book to all who like a fish dinner in perfection."—*Sun.*
London: LONGMAN, BROWN, GREEN, & LONGMANS.

This day, price 1s.; by post, 1s. 4d.,

THIBAUT'S SYSTEM DES PANDEKTEN RECHTS

WITH NOTES AND ILLUSTRATIONS

By NATHANIEL LINDLEY, of the Middle Temple, Esq., Barrister-at-Law.

William Maxwell, 32, Bell Yard, Lincoln's Inn, Law Bookseller and Publisher: Hodges & Smith, Grafton Street, Dublin.

JUST PUBLISHED,

ARTHUR HENDERSON AND CO'S CATALOGUE No. I., containing Orchideæ, Exotic, Greenhouse, and Hardy Ferns, Select Stove Plants, including Aquatic, Variegated-leaved Plants, and Plants suitable for suspending in the Stove and Orchideæ House, Greenhouse Plants, Indian Azaleas, Camellias, Ericas, Herbaceous and Alpine Plants, which may be had on application to them at Pine Apple Place, Edgware Road.

GEORGE MILLS' TREATISE ON THE CULTURE OF THE CUCUMBER, MELON, SEAKALE, AND ASPARAGUS, will be sent free by post on the receipt of 8s. 6d. in postage stamps.

"The details are given with accuracy, and the language used is clear and intelligible to all; a person ignorant of gardening may grow either Melons or Cucumbers with the assistance of Mr. Mills' Book."—*Part of Dr. Lindley's Review.*

George Mills, Uxbridge Road, Ealing, Middlesex.

GEORGE MILLS' TREATISE ON THE CULTURE OF THE PINE will be sent free by post on the receipt of 2s. 6d. in postage stamps.

"There is no mystery here, no preposterous mixture of all manner of unmentionable substances called a compost; no crotchety schemes for rendering the building dear or unmanageable; no ignorant recommendation of operations to which reason in the first instance and experience afterwards are alike opposed. The foundation of the author's success is common sense."—*Part of Dr. Lindley's Review.*

George Mills, Uxbridge Road, Ealing, Middlesex.

Now ready at all the Libraries, in Two Volumes,

SAM SLICK'S NEW WORK.

NATURE AND HUMAN NATURE.

"Eye Nature's walks, shoot folly as it flies,
And catch the manners living as they rise."—Pope.

Hurst & Blackett, Publishers, Successors to Henry Colburn, 13, Great Marlborough Street.

Nearly ready, price 6d.,

Herbert, 68, Cheapside; Editor's Offices (Offices for Patents), 47, Lincoln's Inn Fields, London.

NURSERY AND SEED BUSINESS,

Established in the Year 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.—Apply to Mr. Young, the Proprietor, Elm Cottage, Taunton.

HYLANDS PARK, NEAR CHELMSFORD.

TO BE LET, with immediate possession, the productive KITCHEN GARDENS attached to the mansion, together with the Forcing Houses, Graperies, Melon Grounds, Peach and other Fruit Houses, &c.—To view apply to Mr. Kennedy, the Bailiff, Hylands Park, Chelmsford: and for particulars of terms to Messrs. Barker, Bowker, and Peake, 1, Gray's Inn Square, London.

SPADE FARM—WARWICKSHIRE.

Within Four Miles of Warwick and Six of Leamington, about a Mile and a Half from "Hatton Station" on the Great Western Railway, where 13 Trains stop Daily.

TO BE LET, unfurnished, or partially furnished, for the residue of a Lease terminating Michaelmas, 1859, and which can probably be renewed, NORTON LODGE, in the above most eligible situation, contains four Reception Rooms; Five best Bed Rooms, with Three Dressing Rooms; Bath Room; Five Servants' Bed Rooms, and Capital Offices. Stabling for Six Horses, Coach House, Gardens, and Pleasure Grounds, &c. In addition to the House and Grounds there are about thirty-five Acres of fine Land, of which half is arable, under the plough and fork, deeply tilled, and perfectly clean. Five acres are cultivated on the Lois-Weedon Wheat system. The House is on a good elevation, commanding an extensive view of the surrounding country, is in the most complete order, a large outlay having been made both by the proprietor and the present occupier. The Lease is on favourable terms.—Apply to Messrs. Cookes, Sons, and Meres, Estate and House Agents, Auctioneers, &c., 34, Warwick Street, Leamington.

TO BE SOLD, by private treaty, a NURSERY and PLANT BUSINESS, established nearly 70 years. The Proprietor of this old-established Nursery Business is willing to retire, and dispose of the Stock and Good-will. The nursery comprises about 20 acres of ground, and about 15 large and commodious Stove, Greenhouse, and Propagating Houses, with numerous Pits, frames, &c. *The business is in full working order, and is capable of being increased to almost any extent, and of being made one of the best provincial nurseries in the kingdom.* The stock is in a flourishing condition, being young, healthy, and in good saleable order, and comprises a general assortment of all the most saleable Forest Trees, Shrubs, Fruit Trees, Stove, Greenhouse, and Miscellaneous Plants. The Nurseries are situated close and adjoining one of the largest towns in the West of England, with a population of more than 100,000 inhabitants. The whole of the land, houses, &c., belongs to the proprietor, *who will have no objection to grant a long lease to his successor or successors, and at least one-half of the purchase money could remain on security at common interest.* The business has been carried on with great success by the present proprietor, which partly contributes to his retiring from the business. None but principals and *bonâ fide* purchasers will be treated with.—Address in the first instance, A. B. C., Office of this Paper.

TO NURSERYMEN, FLORISTS, ETC.

TO BE SOLD, and may be entered upon immediately, at a fair valuation, or by private contract, a most eligible and old-established NURSERY, of nearly 10 acres, well stocked, situate in a large town, close to the London and North-Western Railway Station, and convenient for railway transit to all parts of the kingdom. To a person of good capital it presents an opportunity rarely met with. The entrance grounds, recently laid out, are most pleasantly situated. The Vinery, Greenhouses, Pits, and Frames well stocked with Camellias, Geraniums, &c., are of recent erection, and have been arranged with strict attention to usefulness and convenience, having an excellent supply of water from cisterns in each house, supplied from the roof, and also a fine Pond in the centre of the grounds, with an Ornamental Fountain. There is a handsome Seed Shop at the entrance, excellently fitted up, with a Warehouse and Counting-house attached. The Purchaser would be required to pay two-thirds of the amount on entrance, and to give satisfactory security for the remainder in six months.—For particulars apply to Mr. J. Ogden, Nurseryman and Seedsman, Coventry.

TO BE SOLD, a snug little concern, consisting of Dwelling House, Shed, and Cart Shed, light Cart, and Harness; three new Pits with flues, stocked; a quantity of Loam, Peat, and Silver-sand; with 1700 Moss Roses in pots, 1300 Roses in beds, 1000 yards of Box Edging, and other miscellaneous stock. To be disposed of on account of ill-health.—Apply (any day except Thursday or Saturday) to Mr. W. Seaward, Church Row, West Hackney.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

TO BE SOLD, NORFOLK STOCK TURKEYS, of various prices, all young. Also other Useful and Ornamental Poultry, splendid Brahma Pootra, with buff Cochins, &c., &c.; also the Eggs of these birds, and some Aylesbury Ducks, to be parted with immediately; also the Patent right of an Invention of great use and utility as well as perfectly novel.—Apply to A. Z., Mr. Newman, 7, St. Giles Street, Norwich.

DORKING FOWLS.—Eggs, from remarkably large and weighty birds, of the best coloured breed, will be disposed of at 15s. the dozen, box included.—Address W. G., Railway Inn, Holme, Stilton, Hunts.

COLOURED DORKINGS.—EGGS, from coloured Dorking Fowls, which have taken prizes and been commended at Reading, Cambridge, Norwich, and Colchester Shows at half a guinea the setting of 13; also Eggs from prize Buenos Ayrean Ducks at the same price.—Apply to Rev. E. H. Kittoe, Chadwell Rectory, Grays, Essex.

MR. DANIEL HARRISON will dispose of EGGS from his first prize Coloured Dorkings, Bramah Pootra, Golden Pencilled Hamburghs, and Rouen Ducks, at 10s. 6d. per dozen, or 1s. each. The above stock have this last year taken prizes wherever exhibited, including Birmingham, Cambridge, Manchester, Liverpool, &c.—Singleton Park, Kendal, March 10.

POULTRY.—Eggs of Brahma Pootra Fowls at 10s. per dozen: Buff and Partridge Cochin China, Dorking, Black Spanish Fowls at 5s. per dozen; package included. Also a few birds of each of the above and a pair of Golden Spangled Bantams on sale, at very moderate prices.—For particulars apply to An Amateur, Matlock, Bath.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

T. F. WINSTANLEY, Nurseryman, Seedsman, and Florist, begs respectfully to inform his patrons, the nobility, and public, that he has added to the above business that of AUCTIONEER and VALUER to noblemen, gentlemen, and nurserymen about relinquishing their establishments, or otherwise desirous of disposing of their stock of Conservatory, Greenhouse, and Stove Plants.

T. F. W. having been for some years in a Nursery previous to his coming to Manchester, trusts that his knowledge of Plants and their value will enable him the better to dispose of them than any ordinary Auctioneer.—28, Market Place, Manchester.

FANCY POULTRY & PIGEONS.—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, March 20, at 12 o'clock precisely, a collection of choice POULTRY from the yards of Mrs. Herbert, of Powick, Rev. S. Donne, Oswestry, Mr. Vorley, Holbeach, and others; comprising Dorkings of first-rate quality, Cochins, Spanish, Polands, Hamburgs, &c. Also the entire Stock of PIGEONS of the late Mr. H. E. Morey, one of the oldest fanciers in London, consisting of Almonds, Black and Yellow Mottles, &c., and a Cantelo's Hydro-Incubator.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. Stevens, 38, King Street, Covent Garden.

WANDSWORTH.

MR. J. WILLMER is instructed by Mr. Robert Neal to Sell by Auction on the Premises, Wandsworth Common, on MONDAY, March 12th, and five following days at 1 o'clock each day, the stock of this well-known Nursery, consisting of Green Box, 3 to 5 feet; Arbor-vitæ, 2 to 5 feet; Green Hollies, 3 to 12 feet; Yews, 2 to 6 feet; Cedrus deodora, 2 to 5 feet; Striped Box, 3 to 4 feet; Cedar of Lebanon, 3 to 4 feet; Scarlet ponticum and catawbiense Rhododendrons, 2 to 4 feet; Standard Rhododendrons of sorts, Kalmia latifolia, 2 to 4 feet; Buxus bellericus, 2 to 3 feet; Striped Hollies, 1 to 2 feet; Irish Yews, 3 to 4 feet: Arbutus, 1 to 3 feet; Juniperus Chinensis, 2 feet; Portugal Laurels, 4 to 6 feet; Spruce Fir, 5 feet; Evergreen Privet, 2 to 4 feet; Laurels, 2 to 4 feet; Aucuba, 2 feet; Standard and Dwarf Roses, large Standard Pears and Cherries, Maiden Pears, Dwarf-trained Pears, Weeping Ash, Weeping Willows, Gooseberries, Currants, Victoria Rhubarb, large Limes, Athena Poplar, Laburnums, Horse Chesnuts, Mountain Ash, Weymouth Pine, Fir, Standard Thorns, &c., may be viewed till time of Sale, and Catalogues had on the Premises; or by forwarding four postage stamps to the Auctioneer, Sunbury, Middlesex.

TO GENTLEMEN ABOUT TO ORNAMENT THEIR GARDENS, TERRACES, OR PLEASURE GROUNDS.

THE ANNUAL SALE of the Borough Road Artificial Stone Works, 74, Borough Road, opposite the Queen's Bench Prison, will take place on THURSDAY, the 22d March, at 10 a.m., when the whole collection, consisting of FOUNTAINS in great variety, FIGURES, Classical and Modern, a large assortment of Beautiful VASES, &c., will be sold by Public Auction, without reserve.—Catalogues to be had eight days before the sale on the premises.

Sale of the Entire Herd of Pure-Bred North Devon Cattle, and Suffolk Horses, the Property of the Right Hon. the Earl of Aylesford, at the Dairy Farm, Packington, in the County of Warwick.

BROWN AND CLARKE have the pleasure to announce to the admirers and breeders of Devon Cattle, that the Sale of pure-bred DEVONS, the property of the Right Honourable the Earl of Aylesford, will take place at the Dairy Farm, Packington, on FRIDAY, the 23d March, on which occasion they will have the honour to submit by Auction the following STOCK, viz.:—55 Cows and Heifers, in milk or in calf, and their young Calves; 40 Two-year-old and Yearling Heifers; 30 Three-year-old, Two-year-old, and Yearling Steers; 4 Bulls, various ages. The Cattle to be offered at the sale will be found to possess the highest degree of purity and most beautiful symmetry, having been bred by the noble proprietor from beasts purchased out of the best herds in the kingdom. The young stock possesses all the most desirable qualities of this justly admired breed.

HORSES AND COLTS.

Two Suffolk Mares in foal, and 3 Barren Mares; 2 Three-year-old, 1 Two-year-old, and 2 Yearling Chesnut Suffolk Colts; 2 Three-year-old, 3 Two-year-old, and 2 Yearling Filleys; 1 Two-year-old Black Filley; a superior Suffolk Stallion "Punch;" 9 powerful Draught Horses. Luncheon on the table at half-past 10 o'clock, and the sale to commence at half-past 11 precisely. Catalogues may be had at the Dairy Farm, Packington; Mr. Newton, the Farm Bailiff, Meriden: Spread Eagle, Rugby; Warwick Arm, Warwick; and the Auctioneers, Coventry. The place of sale is within three miles of the Hampton, and three and a half miles of the Coleshill Stations, on the London and North-Western Railway.

A LIST OF GRASS SEEDS AND OTHER FARM SEEDS

OFFERED BY

J. C. WHEELER AND SON,

SEED GROWERS, GLOUCESTER,

(ESTABLISHED IN THE EARLY PART OF THE EIGHTEENTH CENTURY)*

SEEDSMEN TO THE GLOUCESTERSHIRE AGRICULTURAL SOCIETY.

The following are some of the best Natural Grasses well calculated for Permanent Pasture:—

Adapted for strong heavy land.

MEADOW CATSTAIL, OR TIMOTHY GRASS (Phleum pratense) ... 10*d.* per lb.
The Timothy Grass possesses the advantage of affording double the quantity of nutriment when its seeds are ripe that it does if cut when in flower. On strong, tenacious, and rather moist soils, it is entitled to a precedence to almost any other, and should at least form a considerable portion of the mixture employed for laying down such, either for alternate husbandry or permanent pasture.

Valuable for its earliness.

MEADOW FOXTAIL GRASS (Alopecurus pratensis) ... ... 1*s.* 6*d.* per lb.
This is one of the earliest and best of Pasture Grasses, but not so well adapted for hay, as it produces but few stalks; its root leaves are very broad, long, soft, slender, and grow rapidly when cut, or when eaten down by live stock. It requires two or three years after sowing to arrive at full maturity.

May be sown under trees.

ROUGH COCKSFOOT (Dactylis glomerata) ... ... 1*s.* per lb.
Is a valuable Grass in cultivation, on account of the great quantity of produce which it yields, and the rapidity with which its leaves grow after being cut. It is well adapted for growing in shady moist places under trees, as in orchards, &c.

Alternate culture.

MEADOW FESCUE GRASS (Festuca pratensis) ... ... 1*s.* per lb.
This is an excellent Grass, either for alternate husbandry or permanent pasture, but more particularly the latter. It is well liked by all kinds of herbivorous animals.

Suitable for parks and valuable for sheep pasture.

HARD FESCUE GRASS (Festuca duriuscula) ... ... 1*s.* per lb.
Will thrive on a great variety of soils, and is found to resist the effect of severe drought in summer, and to retain its verdure during the winter, in a remarkable degree. From the fineness of its foliage and greenness in winter, it is well adapted for sowing in parks, especially for sheep pasture.

Well liked by sheep.

SHEEP FESCUE (Festuca ovina) ... ... 1*s.* per lb.
This Grass forms the greater part of the sheep pasture of the Highlands. In quantity of Grass it is much inferior to the other cultivated Fescues; but, from being well liked by sheep, it should always enter into the composition of mixtures of lands on which they are to be pastured: in fact, on the authority of Linnæus, these animals have no relish for hills and heaths which are destitute of this Grass.

Well adapted for pleasure grounds.

WOOD MEADOW GRASS (Poa nemoralis) ... ... 1*s.* 3*d.* per lb.
Its habit of growth is delicate, upright, close, and regular. There is no Grass better adapted for pleasure grounds, particularly under trees, as it will not only grow in such places, but forms a fine sward where few of the other fine Grasses can exist. It produces a considerable deal of foliage early in spring.

Valuable for damp soils.

ROUGH-STALKED MEADOW GRASS (Poa pratensis) ... ... 1*s.* per lb.
This is a valuable Grass as a mixture for Grass Lands, particularly on damp soils. Its habit of growth fits it for mixing along with the upright grown sorts, such as the Italian Rye-grass.

Very early Grass.

SMOOTH-STALKED MEADOW GRASS (Poa trivialis) ... ... 1*s.* per lb.
This Grass yields a large quantity of herbage at a very early period of the season.

Remarkable for its fragrance.

SWEET-SCENTED VERNAL GRASS (Anthoxanthum odoratum) ... 2*s.* per lb.
This Grass yields but a scanty portion of herbage, yet, on the whole, Permanent Pasture should not be without a mixture of it, particularly in parks and pleasure grounds, were it for no other reason than its pleasant scent, not only when cut for hay, but also when the seeds become nearly ripe.

Suited for lawns.

CRESTED DOGSTAIL GRASS (Cynosurus cristatus) ... ... 2*s.* per lb.
From this Grass forming a close turf, and having rather fine foliage, it may be advantageously sown on lawns and other places to be kept under by the scythe.

For some of our descriptions of Grass Seeds, we are indebted to Lawson's Agrostographia.

Lawn Grass.

LAWN GRASS SEED ... ... 1*s.* 0*d.* per lb.

Clover seed.

CLOVER—White Dutch	9*d.* to 0 10	"
" Red or Broad	7*d.* to 0 8	"
" Trefoil	4*d.* to 0 5	"
" Cow Grass, or Perennial Red Clover	0 10	"
" Alsike	2 6	"

Evergreen.

ITALIAN RYE-GRASS—Imported Seed... ... per bushel 6 0

PERENNIAL RYE-GRASS (Pacey's) ... ... " 4*s.* 6*d.* to 5 6

We have found by our experience about 12 lbs. of Clover Seed—a mixture of Alsike, Cow Grass, White Dutch, and Trefoil (the proportions varying according to the nature of the soil)—and 2 bushels of Grass Seeds to be about the quantity required for laying down *an acre of Permanent Pasture, and these Seeds we can supply at from* **24s. to 30s. per acre.** *Quantity of seed required per acre.* *Price.*

For the improvement of Old Pastures, we should recommend, when the land is being dressed in the spring with manure, that about 8 or 10 lbs. of Grass Seed per acre be harrowed or bushed in with it; the quality and quantity of the herbage will be thus greatly improved. Suitable Seed for this purpose we can supply at **10d. per lb.** *Renovation of old pastures.*

GRASS SEEDS.

Grass seeds more in demand of late.

The demand for Natural Grass Seeds has greatly increased during the last few years; formerly many of the better sorts were scarce and dear, and their price was such as to prevent their being generally brought into cultivation, so that recourse was had to seeds scattered about the hay loft, which being often mixed with inferior varieties and weeds, produced but an indifferent sward, and formed a striking contrast to those pastures where seeds of the best and most nutritive sorts had been sown.

Inferior sorts used, and their pernicious results.

Reduced prices of the best sorts.

In consequence of the annually increasing demand for the better sorts of Grass Seeds, the price has been so reduced as to be within the reach of all, and more attention has been paid to saving and hand-picking them, keeping each sort separate and free from weeds; so that now whether land is required to be laid down for permanent pasture—or only for a year or two—under Trees, as in Orchards and Parks—in mossy and poor soil, or even on drifting sands, the different Grasses can be so selected and mixed as to form valuable pastures. For Lawns and Pleasure Grounds the finer growing sorts are well adapted, and a few months after sowing a fine sward is obtained, equal, if not superior to that formed by laying down turf, and at less than a quarter of the expense.

Usual time for sowing Grass seeds.

In laying down Land for Permanent Pasture, the plan usually adopted is to sow the seeds in spring, on land with Barley or where a crop of Wheat is growing; but it is a question with some whether it is not better to sow the seeds on ground without any other crop; in this case, if the land is in a good state of cultivation, and the seed sown in the spring (say in March or April), a good crop of Grass can be obtained in a very short time. We have also known Grass Seeds sown in this way in August and the beginning of September with complete success.

Proportion of Clover.

Alsike Clover.

In selecting Seeds for laying down Permanent Pasture, there should be a proportion of Perennial Red Clover or Cow Grass (Trifolium pratense perenne), and also some of the Alsike Clover (Trifolium hybridum) mixed with the other Clovers. The Cow Grass is well known, and highly esteemed, but it is somewhat difficult to obtain *true*. The Alsike Clover is a cross, or hybrid, between the White Dutch and the Broad or Red Clover. The Messrs. Lawson, speaking of this variety, say, "It is deservedly in repute as one of the best Perennial Clovers, and well adapted for growing in this country; one proof of its valuable qualities is in the great and yearly increasing demand for its seeds; but hitherto, from the comparative high price, it has not received a fair trial in field culture. From the result of our experiments, it is found to thrive on such soils as are termed by the farmers 'Clover-sick,' and must, were it for this quality alone, prove a most valuable acquisition to our cultivated field plants."

SWEDE, MANGOLD WURZEL, TURNIP,

AND OTHER

AGRICULTURAL SEEDS.

CARROT—LARGE WHITE BELGIAN	2*s.* 6*d.*	per lb.
" LARGE RED ALTRINGHAM	3 0	"
FRENCH FURZE, or GORSE	1 6	"
KOHL RABI	3 6	"
LUCERNE—FINEST IMPORTED	1 0	"
PARSNIP—LARGE CATTLE	2 0	"
VETCHES or TARES—SPRING		
" " WINTER		
SWEDES—IMPROVED WHITE	2 0	"
" SKIRVING'S PURPLE TOP	2 0	"
" LAING'S	2 0	"
This is a well-formed and excellent Swede.		
" EAST LOTHIAN	2 2	"
This is a large Swede, highly esteemed, and extensively grown in Scotland.		

White Carrot.

Through the severity of last winter Swede Seed is very scarce.

TURNIP—TWEEDDALE YELLOW BULLOCK ... ... 2*s.* per lb.
This is a new Scotch Turnip, of excellent quality; it is a great improvement on the old Purple-top Yellow Scotch. The stock at present in cultivation is extremely limited, and we can offer it only in small quantities. We strongly recommend a small quantity to be sown as a sample.

Quite new and scarce.

TURNIP—IMPROVED PURPLE-TOP YELLOW ... ... 1*s.* 6*d.* per lb.
The flesh and under part of the skin of this Turnip is deep yellow, with a purple top, hardy, of good size, and keeps well.

A valuable substitute for Swedes.

TURNIP—LINCOLNSHIRE RED GLOBE ... ... 1*s.* 2*d.* per lb.
This variety can be strongly recommended as a large handsome Turnip, of excellent quality.

TURNIP—DALE'S HYBRID ... ... 1*s.* 2*d.* per lb.

TURNIP—PURPLE-TOP ABERDEEN ... ... 1*s.* 2*d.* per lb.
This is an old and very deservedly esteemed variety, and is considered by some to come nearest the Swedes, in hardness and solidity of texture.

TURNIP—GREEN GLOBE... ... ... 1*s.* 2*d.* per lb.
Roots of a fine globular shape, with a small neck and tap-root: very white under and green above the surface of the ground; of the medium size, hard and firm in texture.

TURNIP—POMERANIAN ... ... 1*s.* 2*d.* per lb.
This variety was introduced some years since from Pomerania, and may be considered as the most perfect Globe Turnip in shape, as well as the most regular or uniform in growth. Its skin is of a smooth white and somewhat shining or transparent appearance; leaves smoothish, of a dark green colour, and whitish nerves.

The best White Globe Turnip.

TURNIP—WHITE GLOBE	1 0	per lb.
" EARLY STONE, or STUBBLE	1 6	"
" GREEN ROUND NORFOLK	1 0	"
" RED ROUND NORFOLK	1 0	"
" WHITE ROUND NORFOLK	1 0	"
" TANKARDS	1 0	"
MANGOLD WURZEL—LARGE YELLOW GLOBE ...	1 0	"
" LONG RED	1 0	"
" LONG YELLOW	1 0	"
" RED GLOBE	1 0	"

Of this we have a fine stock true to name, saved from selected Bulbs.

We can very strongly recommend our large Yellow Globe Mangold. Some very large roots have been exhibited at the Agricultural Show in this City, grown from Seeds supplied by us, many of the roots weighing from 30 lbs. to 40 lbs., and the average weight above 30 tons to the acre.

GARDEN SEEDS.

Seeds of our own growth.

It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality, and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving complete satisfaction to our customers. We are in receipt of most gratifying letters and renewed orders from those we had the honour of serving former years; and as we deliver our Seeds Carriage Free, we very respectfully solicit the honour of an order from those who have not yet given us a trial. We have the pleasure of subjoining the notice our Seed Catalogue has received:—

Delivered carriage free.

"The Catalogue of Seeds sold by J. C. WHEELER & SON, of Gloucester, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short, select Seed List to an interminable labyrinth of names, which, for the most part, represent nonenities or rubbish. Messrs. WHEELER's little book will do something to satisfy their expectations."—*Gardeners' Chronicle*, March 2.

We beg to offer the following Collections of Garden Seeds:—

Collections of Seeds.

No. 1.—A COMPLETE COLLECTION, SUITABLE FOR A LARGE GARDEN	£3	0*s.*	0*d.*
No. 2.—A COLLECTION OF EQUALLY CHOICE VARIETIES, BUT SMALLER QUANTITIES	1	10	0
No. 3.—A COLLECTION SUITABLE FOR A SMALL GARDEN	0	15	0

These Collections will be delivered Carriage Free.

Early Orders are respectfully solicited. We deliver our Seeds Carriage Free.

* We cannot tell the exact year our Business was established, but we have in our possession a copy of a work written by "James Wheeler, Nurseryman in Gloucester," 1763, published in London by W. Owen, at Homer's Head, near Temple Bar, Fleet Street, entitled "THE BOTANISTS' AND GARDENERS' NEW DICTIONARY, containing the Names, Classes, Orders, Generic Characters, and Specific Distinctions of the several Plants cultivated in England according to the system of Linnæus; directing the culture of each Plant, describing its singular Virtues and Uses, and explaining the Terms peculiar to Botany and Gardening. In which is also comprised a 'Gardener's Calendar,' divided alphabetically, according to the Names of the twelve Months of the Year, directing the whole Practice of Gardening in the Flower Garden, the Seminary, the Fruit Garden, the Kitchen Garden, the Greenhouse, and the Stove."

J. C. WHEELER & SON, NURSERYMEN AND SEED GROWERS, GLOUCESTER.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, March 10, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 11.—1855.] SATURDAY, MARCH 17. [PRICE 6*d*.

HORTICULTURAL SOCIETY OF LONDON.—GARDENERS and NURSERYMEN who propose to EXHIBIT at the next MEETING on April 3, can have the Schedule of the day sent them by post, upon application at this Office.
21, Regent Street. W. B. BOOTH.

NATIONAL FLORICULTURAL SOCIETY, 21, Regent Street.—The Exhibitions for 1855 will be held on

THURSDAY, March 22.		THURSDAY, August 9 and 23.	
"	April 5 and 26.	"	Sept. 6 and 20.
"	May 17 and 31.	"	October 4.
"	June 7 and 21.	"	November 15.
"	July 12 and 26.	"	December 6.

The Chair to be taken, and the Report read at 3 o'clock each day precisely. Visitors, *not being Exhibitors*, will be admitted at 2 o'clock Exhibitors at half-past 2 o'clock.

NOTICE.—All subjects intended for examination must be at the Office, entered and staged, by 1 O'CLOCK, at which time the Censors will proceed to duty. Under no pretence can Flowers be staged for competition after that time. Intending Exhibitors will do well by giving a day or two's notice to the Secretary of such their intention, that ample provision may be made for the selection of Censors best qualified for particular subjects.
JOHN EDWARDS, Secretary.

NATIONAL FLORICULTURAL SOCIETY, 21, Regent Street.—At the Exhibition on THURSDAY next, March 22d, Messrs. W. Holmes, C. Lidgard, and A. Parsons will act as Censors of Cinerarias, Primulas, Camellias, &c.
Intending Exhibitors of *other subjects* will do well by giving timely notice of such their intention, that the selection of Censors best qualified may be facilitated. JOHN EDWARDS, Secretary.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The Second Annual General Meeting of the Members of the above Society will be held at the Horns Tavern, Kennington, on WEDNESDAY, April 4th, at 8 p.m.
The following Exhibitions will take place during the season, viz.:—In APRIL, for Auriculas, Polyanthuses, Heartsease, Cinerarias, &c. MAY, for Tulips, Heartsease, Pelargoniums, &c. JUNE, for Pinks, Ranunculuses, Roses, &c. JULY, for Carnations, Picotees, Verbenas, Fuchsias, &c. SEPTEMBER, for Dahlias, Hollyhocks, &c.; and NOVEMBER, for Chrysanthemums, &c.
Subscriptions for Members, 20*s*. per annum; Honorary Members, 10*s*. per annum. Both Members and Honorary Members will have the privilege of admission for themselves, and two Tickets for friends for all Shows of the Society.
JOHN BUSHELL, Hon. Sec.
Lower Kennington Lane, Lambeth.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—NOTICE is hereby given that an Election of Two Pensioners on the Funds of this Charity will take place in June next. All persons desirous of becoming Candidates are requested to send in their certificates and testimonials to the Committee on or before the 31st inst., after which time they will not be received. Forms of petition may be had on application to
March 10. EDWARD ROGER CUTLER, Sec.,
14, Tavistock Row, Covent Garden.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.
*** Plans and Estimates furnished.

BOX TREES.
MESSRS. E. G. HENDERSON AND SON, of the WELLINGTON NURSERY, St. John's Wood, having on hand a large stock of FINE BOX and LILAC TREES, beg to call the attention of parties engaged in laying out Cemeteries and Ornamental Grounds to the same, which they are willing to dispose of at very reduced prices.—March 17.

NEW RIDGE CUCUMBER VECTIS.—A packet containing 12 good seeds of this first-rate Ridge Cucumber, for particulars of which see *Gardeners' Chronicle* for Jan. 27, 1855, p. 50, will be sent post free, on receipt of 12 postage stamps addressed to THOMAS TAYLOR, Nurseryman, &c., Weston Super-mare.

STRAWBERRY PLANTS.
WILLIAM NICHOLSON is now sending out fine strong plants of his four New and excellent varieties, viz., AJAX, the finest dessert fruit; RUBY, do.; CAPTAIN COOK, dessert and market; FILLBASKET, do., tremendous bearers, at 6*s*. per 100. The plants have been kept in frames under glass, and are in good condition for planting. Post-office orders payable at Yarm, Yorkshire, which are in all cases required with the order.—Egglescliffe near Yarm, Yorkshire.

SUTTON'S FARM SEED LIST, WITH PRICES, may be had gratis and post-free on application. Goods delivered Carriage Free, as see Catalogue.
Reading, Berks, March 17.

MESSRS. J. AND H. BROWN'S NEW PRICED CATALOGUE, post free, of American Plants, Coniferæ, Roses, Geraniums, Fuchsias, Orchidea, Stove and Greenhouse Plants, Fruit Trees, &c. A separate List of Garden Seeds, Choice Flower Seeds, 20 papers, 5*s*.; 40 do., 10*s*. free by post.
Albion Nursery, Stoke Newington, London.

GEORGE EDWARD'S ANNUAL CATALOGUE OF DAHLIAS, GERANIUMS, &c., is now ready, and may be had on application, at his Seed Establishment, 1, King Street, Castlegate, York.—Clarence Nurseries, Haxby Road, York.

T. F. WINSTANLEY'S Descriptive Catalogue of GARDEN and FLOWER SEEDS is now ready, and can be had on application, or sent free by post.
28, Market Place, Manchester.

T. F. WINSTANLEY'S Descriptive AGRICULTURAL SEED LIST will shortly be ready, and may be had on application, or sent free by post. The above List contains much useful information.—28, Market Place, Manchester.

CORNISH EARLY WHITE BROCCOLI, 1*s*. per packet, or 6*s*. per oz.
CONQUEROR OF THE WEST CUCUMBER, 1*s*. per packet, containing 12 good seeds.
The above can be had, warranted genuine, by forwarding postage stamps for the amount to
JAMES LAKE, Seedsman, &c., Bridgewater.

CUCUMBER PLANTS.
CONSTANTINE'S INCOMPARABLE BLACK SPINE.
E. HARMAN begs to offer strong Plants of the above, two in each pot, 48-sized pots, the price per pot, 1s.
Address E. HARMAN, Nursery, Denham, Bucks.

BOSSOM'S CHAMPION OF ENGLAND CELERY.
THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. Winstanley, Seedsman, 28, Market Place, Manchester, price 2*s*. 6*d*. per packet; prices to the trade on application.

CLOVER SEEDS.
GENUINE NEW CLOVER SEEDS *can be had at the lowest market prices of* JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

WHITE BELGIAN CARROT SEED.—PURCHASERS OF LARGE QUANTITIES will be treated liberally.
For prices apply to SUTTON & SONS, Seed Growers, stating the quantity required.

SUTTON'S IMPROVED ITALIAN RYE-GRASS, AND DICKENSON'S ITALIAN RYE-GRASS, are both very superior to the Italian Rye-grass commonly cultivated.
At present Messrs. SUTTON *have a supply of true Seed of each sort, price 7s. 6d. per bushel.*

SUTTON'S IMPROVED ITALIAN RYE-GRASS, AND DICKENSON'S ITALIAN RYE-GRASS, are both very superior to the Italian Rye-grass commonly cultivated.
At present Messrs. SUTTON *have a supply of true Seed of each sort, price 7s. 6d. per bushel.*

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

GERMAN FLOWER SEEDS FRESH IMPORTED.
SUTTON AND SONS *have imported a superior assortment of New German Flower Seeds, a Priced List of which may be had post free.*

IMPORTED GERMAN FLOWER SEEDS.
T. F. WINSTANLEY has received his annual importation (direct from Frankfort) of unrivalled Collections of German Seeds, including Double Ten-Week Stocks, Asters, Zinnia elegans, Truffeaus, new Pæony-flowered Aster, very beautiful, and many other varieties too numerous for insertion. Prices on application; lists free by post.
28, Market Place, Manchester.

GRASS SEEDS, CLOVERS, ETC.
T. F. WINSTANLEY is now ready to send out his Mixture of New Grass Seeds, for Laying down New or for Renovating Old Pasture; finest Mixtures for Lawns, &c. For list of sorts and quantities, &c., see his Garden and Agricultural Seed List, to be had on application.
28, Market Place, Manchester.

MANGOLD WURZEL, ETC.—TO THE SEED TRADE.
BASS AND BROWN beg to offer, of the finest Stocks, Mangold Wurzel, Long Red; Do. Yellow Globe; Do. Red Globe; White Carrot; Skirving's Swede; Orange Jelly Turnip; Meadow Fescue Grass. Wholesale prices to the trade on application.—Seed Establishment, Sudbury, Suffolk.

MANGOLD WURZEL SEED.
PURCHASERS OF LARGE QUANTITIES will be treated liberally.—For prices apply (stating the quantity required) to SUTTON & SONS, Seed Growers, Reading.

MANGOLD WURZEL SEED, LONG RED, and YELLOW GLOBE, warranted genuine, and the growth of 1854. Price 45*l*. per ton.—Apply to R. S. HEWS, Kelvedon, Essex.

GENUINE SEEDS.
THE MEMBERS OF THE "SEED GROWERS SOCIETY," continue to supply genuine AGRICULTURAL, VEGETABLE and FLOWER SEEDS at Growers' prices. Lists with price and terms of business may be had on application to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex.

CHEAP AND GOOD CINERARIAS.—Fine flowering plants from Turner's best seed in large 60 and 48 pots, just coming into bloom, at from 4*s*. to 6*s*. per dozen. Also fine plants of named varieties, consisting of Mr. and Mrs. S. Herbert, Adela Villiers, Garland, Constellation, Lady H. Campbell, Kate Kearney, Flora M'Ivor, Étoile de Venus, &c., at 9*s*. per dozen.—WOOD & INGRAM, Nurseries, Huntingdon.

CABBAGE PLANTS.
THOMAS WELLAND offers fine E. Battersea, E. Imperial, E. York, and Field Drumheads, safely packed to the station for any part of England, Scotland, Ireland, and Wales for 3*s*. 6*d*. per 1000; picklers, 1*s*. per 100.—Surrey Gardens, near Godalming, Surrey.

GIANT ASPARAGUS PLANTS.—Fine plants, three years, at 25*s*. per 1000, can be had of STEPHEN SHILLING, Nurseryman, North Warnborough, Odiham, Hants.

DWARF FRENCH BEANS can be had in any quantity.—Apply to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

BEAUTIFUL SEMI-DOUBLE PRIMULAS.—Only a few packets remain on hand. To prevent disappointment, order without delay.
The celebrated Ipswich Standard Cucumber is sold out, only 12 seeds left.—THOMAS WILD, Ipswich.

LIQUIDAMBAR.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

IPOMŒA RUBRO CÆRULEA.—Seed of this exceedingly beautiful Climbing Annual being now obtainable at a moderate price, all cultivators of flowers having a greenhouse or wall with warm aspect are advised to include it in their spring selection.—Seed supplied to Seedsmen and Nurserymen only, by GEORGE ROBERTS, 32, Moorgate Street, London.

WANTED, a large quantity of GOLDEN-LEAVED BOX, 18 inches high.—Address, stating price, to ROBERT FOGGO, Gardener to Sir William F. F. Middleton, Bart., Shrubland Park, near Ipswich.

WANTED TO PURCHASE, a quantity of FRUIT TREE STOCKS and MAIDEN TREES.—Address, stating sorts and price, JAMES LAKE, Nurseryman, Bridgewater.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, will be happy to forward prices of a large quantity of very fine One-year Seedling LARCH, on application.

FRUIT TREES, FOREST TREES, AND SHRUBS, GARDEN AND FLOWER SEEDS, PERMANENT PASTURE GRASSES, and FINE DWARF LAWN GRASSES.—Catalogues of the above may be had on application to WILLIAM BARRATT, Saint John's Nursery, Wakefield.

LARCH AND SPRUCE TREES.
TO BE SOLD by private Contract—
100,000 excellent Larch Plants, transplanted, 2 to 5 feet.
20,000 Spruce Plants, transplanted, 9 to 24 inches.
For price, &c., apply to Mr. ALEX. LAWRIE, Edgefield, near Holt, Thetford, Norfolk.

TO BE SOLD, very cheap, 20,000 Transplanted NORWAY SPRUCE, 2 to 2½ feet. Price on application.—SAMUEL FINNEY & Co., Gateshead Nursery, Newcastle-on-Tyne.

TO BE SOLD, 63 fine FRUITING PINES and 225 SUCCESSION ditto. To be seen at the late residence of Mr. Alderman Copeland, Leyton, Essex.—For particulars and price inquire of Messrs. HUGH LOW & Co., Clapton.

TO BE SOLD, a first-rate Collection of ORCHIDS and other Stove and Greenhouse Plants, the property of a gentleman declining their cultivation.—For particulars apply to GARAWAY, MAYES, & Co., Durdham Down Nurseries, Bristol.

FLAX SEED, GROWN IN THE NORTH OF SCOTLAND.
TO BE SOLD, in quantity, excellent FLAX SEED, grown from Riga Seed imported. Samples may be had, and prices learned from BENJAMIN REID & Co., Seedsmen, Aberdeen, Scotland. References required from unknown correspondents.

PLANT YOUR POTATOES WITH JACKSON'S PATENT PREPARATION.
BASS AND BROWN having been appointed Agents for the above, will be happy to furnish it to their customers who may be forwarding their orders for Potatoes or other goods. Also Agents for PAGE'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT.—Sudbury, Suffolk.

SEED POTATO, ETC.
THE BRITISH QUEEN, for productiveness, earliness, and quality unequalled:—First size, 7*s*. per bushel; second size, suitable for planting whole, 5*s*. per bushel, carriage paid to London. Also, a very superior Bath Cos Lettuce, in 1*s*. packets, free by post.—HART & NICKLIN, Florists and Seedsmen, Guildford.

NEW CHINESE POTATO—
DIOSCOREA (JAPONICA) BATATAS.
T. F. WINSTANLEY has received a limited quantity of the above new Potato. For description and method of planting see his Garden Seed List, where full particulars are given. T. F. W. has also a few Plants left of the Kaisha or Sweet-kernelled Apricot, a fortnight earlier than the Moor Park. Prices on application.—28, Market Place, Manchester.

FLUKE KIDNEY POTATO.
T. F. WINSTANLEY has a very fine stock of the above unrivalled POTATO, selected small for SEED, as they do not bear cutting. Also Lapstone Kidney, Ashleaf, Flourball, and many other varieties. Prices on application. The Trade supplied.—28, Market Place, Manchester.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.
Post-office Orders to be made payable at Middleton, Lancashire.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.
To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

Great Novelties for the Ensuing Season.

FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE, and CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA

(The Double Snowdrop Corolla'd Fuchsia)

Pure double white corolla, resembling a fine large double Snowdrop, with rich scarlet sepals, altogether distinct from anything of the kind ever yet produced. Price 10*s.* 6*d.* each.

Together with a very beautiful new double Purple variety,

VIOLÆFLORA-PLENA.

Rich double blue corolla, resembling a fine double violet, 7*s.* 6*d.* each.

L., P., & Co. have also fine plants of the following choice kinds of Fuchsias at 18*s.* to 12*s.* per dozen.:—

Aspasia	Glory	Purple Perfection
Apollo	Lucretia	Sir Harry Smith
Brilliant	Orion	Sidonia
Duchess of Lancaster	Prime Minister	Sir Jno. Falstaff
Duke of Wellington	Princess	Telegraph
Dominiana	Kossuth	Resplendent.

They are also now prepared to send out their beautiful new

VERONICA KERMESINA,

Raised by that eminent horticulturist J. Lucombe, Esq., of Coombe Royal who sent specimens to Dr. Lindley, at the time of its first flowering, who thus pronounces his first opinion of it:—"The cuttings sent with this were charming a decided rose colour having mingled with the violet." See also notice of Dr. Lindley in the *Chronicle* for Dec. 2, 1854, as follows:—"L., P., & Co. Your V. Kermesina is a handsome dark variety of V. speciosa; its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite." Price 7*s.* 6*d.* each. A few extra-sized specimens may be had.

The usual discount to the Trade when three or more are taken

Exeter Nursery, Exeter.—Established in 1720.

N.B. The new Hybrid Perpetual Rose Emperor Napoleon I intend sending out in June, at 10*s.* 6*d.* each, orders for which are now solicited. A Descriptive List of the above New Roses can be had on application.

Carriage paid to any Station on the Eastern Counties Railway.

St. John's Street Nursery, Colchester.

LATE WHITE SUPERB BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Theringumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. **Is of very dwarf growth, perfectly hardy, with heads from** 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2*s.* 6*d.* each.

Each may be had of Messrs. Noble, Cooper, & Bolton, 152, Fleet Street; and Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

SALTHILL NURSERY.—ESTABLISHED 1785.

A. J. STEWART begs to offer the following:—

SEEDLING HOLLYHOCKS.	s.	d.
Autocrat, deep pink, compact, well formed, and large ...	5	0
Dauntless, chocolate and white, beautifully veined... ...	3	6
Harriet, pure white, large, and well formed	5	0
Rainbow, bright rosy lilac and white, shaded, mottled, and veined; very attractive	3	6
Mary Stewart, orange and saffron, shaded, well formed ...	5	0
Striata perfecta, silvery-shaded puce, much mottled and veined, well formed, and large	3	6
Pantaloon, an attractive mottled flower	2	6
SEEDLING VERBENAS.—(Plants first week in May.)	s.	d.
Cream of the Valley, deep cream, immense truss, very free bloomer, and fine habit	3	6
Cerise unique, beautiful bright cerise, with lemon eye, first-rate habit, profuse bloomer, good trusses, extra for bedding	3	6

A Descriptive and Priced Catalogue of Geraniums, Fuchsias, Verbenas, Hollyhocks, Chrysanthemums, &c., may be had on application; also a List of Kitchen Garden and Flower Seeds, with prices attached.

SUPERIOR GERMAN SEEDS WARRANTED.

JOHN WEEKS and CO., King's Road, Chelsea, London, beg most respectfully to call the attention of their patrons to their very superior collection of German Seeds, Asters, Stocks, &c., which, having been grown, ripened, and selected under their own immediate care at their Branch Establishment in Germany, they can guarantee to be of the finest sorts and best quality. In order that ladies and gentlemen not possessing them from Messrs. Weeks this season may be enabled to judge of the rare beauty of the different sorts in their splendid collection, they will be grown at Messrs. Weeks' Horticultural Establishment, King's Road, Chelsea, where their patrons may make a personal selection for a future season.

For the general List of all other Seeds, see J. W. & Co.'s Seed Catalogue, and also their various Catalogues of Stove and Greenhouse Plants, Vines, &c. Also their Illustrated Catalogues on Horticultural Buildings and Heating by Hot Water.

SUPERB NEW HYBRID HEATHS.

LUCOMBE, PINCE, and CO., are now prepared to send out their beautiful well-known New Hybrid HEATHS, they were exhibited at the Horticultural Society's meeting at Regent Street, and obtained the large Silver Medal. The following is the description given by the Editor of the *Gardeners' Chronicle*, May 28, 1853:—

"Messrs. Lucombe, Pince, and Co. *received a Large Silver Medal for a collection of new Hybrid Cape Heaths consisting of Lindleyana, Exomiensis, Insignis, Pulcherrima, Exquisita, and Metulæflora superba, all fine kinds possessing large bold flowers and bright clear colours; they were stated to have been raised from Massoni, Ampullacea, Sprengelli, Hartnelli, and Aristata, all of which will be seen good parents.*"

L., P., and Co. can assure all cultivators of this beautiful tribe of Plants that these fine varieties cannot fail to give satisfaction as they possess excellent habits and have large rich coloured flowers of much substance, which are produced in great profusion, properties that fully justify L., P., and Co. in very strongly recommending them to the public. Price, 3*l.* the set of six.

Exeter Nursery, Exeter. Established 1720.

Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in the Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to Waterer and Godfrey, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where carriage conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. Jackson.

EXTRACTS:—

"One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up: while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. Baxter.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. Gordon, K.C.B., Marlee House, Blairgowrie.

"Sir,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. Jackson, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. Jackson's process may be widely known, as it is a great boon.—I am, &c., John Shanks,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. Austin, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. Charlwood & Cummins, Seedsmen, Covent Garden; and John Kersan, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

SUPERB HOLLYHOCKS, SEEDS, ETC.

Dwarf German (10 week) Stocks, as imported, 36 varieties, each variety 3d. per packet.—WM. CULLINGFORD, 1, Edmund Terrace, Paul's Road, Islington, London.

N.B. Elletson's superb new late Dwarf White Broccoli Seed "Emperor", 2s. 6d. per packet. The Broccoli raised from this seed weigh from 17 lbs. to 25 lbs. each.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz.:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Raby Castle. Also a quantity of strong dwarf-trained Pears and Plums of the best sorts, Fastolff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes, well kept, of the best sorts.—For further particulars apply to JAMES LAKE, Nurseryman, Bridgewater.

HOPS SUPERSEDED BY THE BAVARIAN BITTER, a perfect substitute for Hops, of an agreeable flavour, quite soluble in wort or beer, saving the trouble of straining through a Hop-back, and giving to Beer the well-known keeping properties of the Bavarian Beer. Price of 1 packet, 1s. 8d., which is equal to 5 lbs. of best Hops.—Prepared only by THOMAS PRATT WILLS, St. George's Square, Portsea. Free per post.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, NURSERYMEN and SEEDSMEN, Exotic Nursery, Canterbury, have assorted Collections of VEGETABLE and FLOWER SEEDS, containing the most desirable varieties in cultivation.

VEGETABLE SEEDS.

		£	s.	d.
No. 1.	Collection for a large garden, containing 20 quarts of Peas of the best sorts for succession, 10 best sorts of Broccoli, 8 do. of Lettuce, with all other Vegetables in proportion	£2	10	0
No. 2.	The best new and other sorts in smaller quantities	1	10	0
No. 3.	Ditto Ditto Ditto	1	0	0
No. 4.	A collection of esteemed kinds for a small garden	0	10	6

FLOWER SEEDS, with printed directions for their culture, in collections of 12 for 2s.; 25 for 4s.; 50 for 8s.; 100 for 15s.

WILLIAM MASTERS & SON respectfully solicit commissions, and beg to intimate to their kind patrons, that the varieties to be included in these Collections may be selected by their own Gardeners from the newly printed Lists to be had on application.

NOTICE.—For full particulars of EDWARD TILEY'S two unequalled new Cucumbers, Melons, and Seedling Potato, see advertisement in *Gardeners' Chronicle* of 24th February, 1855, page 128, together with an exact representation of the Cucumber, Sir Colin Campbell.

TWO NEW CUCUMBERS, SIR COLIN CAMPBELL and GENERAL CANROBERT, 3s. 6d. per packet, or a packet of each and a packet of either of the Melons mentioned in the advertisement of the above date (except Golden Drop and Scarlet King) for 6s.

TILEY'S SEEDLING POTATO, THE CHAMPION MONEY, the best and earliest in the world, price 5s. 6d. per peck, hamper and package included, or 1l. per bushel.

UNEQUALLED NEW MELON, GOLDEN DROP (Green Flesh), price 1s. 6d. per packet.

THE KING, a superb Scarlet Flesh Melon, 1s. 6d. per packet. A packet of Golden Drop, one of the King Melon, together with a packet of any other variety mentioned in the former advertisement will be forwarded post free on receipt of 3s. 6d. in cash or penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somersetshire.

NEW BEDDING CALCEOLARIAS.

MESSRS. WILLIAM ROLLISSON AND SONS beg to announce that they have purchased the entire stock from Mr. Cole of the undermentioned Gems, and will commence sending out on the first week in May.

CALCEOLARIA VARIABILIS, 10s. 6d. each.—As a bedding plant this will make a charming variety, and in some measure supply the deficiency there has been for durable and effective flowers of a light colour for the parterre. It is an excellent grower of very compact, pretty habit, and produces in great profusion immense trusses of blossom, which open of a delicate primrose colour, and change to white. Altogether it is a most desirable acquisition, and a variety thoroughly distinct to any in cultivation.

CALCEOLARIA ECLIPSE, 10s. 6d. each.—This is the most brilliant and brilliant coloured variety ever raised, of nice compact habit, producing large trusses of glowing crimson flowers, which are remarkable for the length of time they last in bloom; as a bedding plant its value will be inestimable. It received a first class certificate by the National Floricultural Society, June 13, 1854, also at the Royal Botanic Gardens, Regent's Park, for its good qualities and matchless colour.

The above two Calceolarias produce such magnificent trusses of bloom, and are so extremely effective, that they will be admirably adapted for Greenhouse and Conservatory decoration.

Messrs. W. R. & Sons have an excellent stock of Rollisson's Scarlet Geranium, which can be supplied at 5l. per 100. Although well known, this is a very useful and showy plant for bedding and decorative purposes.

Messrs. William Rollisson & Sons beg to draw attention to their extensive Collection of Specimen and Half-specimen Orchids, Azaleas, Stove and Greenhouse Plants, &c. &c., which are this season in unusually fine condition.

The Nurseries, Tooting, near London.

NEW AND RARE CONIFERÆ.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, have still on hand a small quantity of the Seeds of the following RARE CONIFERÆ, &c.:

	£ s. d.		£ s. d.
Pinus Lambertiana, 50 Seeds	1 5 0	Taxus Lindleyana (quite new) 50 Seeds ...	2 2 0
P. tuberculata, entire cones	2 2 0	Club-headed Wheat (cultivated by the old Californians) 200 grains	1 0 0
P. monticola, 50 Seeds ...	2 2 0	Wheat (a variety of Triticum durum) do.	15 0
P. Jeffreyi do. ...	2 2 0		
P. Beardsleyi do. ...	2 2 0		
Libocedrus decurrens, do.	1 5 0		

Full descriptions will be found in the last page of the *Gardeners' Chronicle*, for Feb. 3.—Orders may be addressed to PETER LAWSON & SON, in Edinburgh; or to their London House, 27, Great George Street, Westminster.

NOW READY.

WILLIAM AND GEORGE DAVISON can supply complete collections of KITCHEN GARDEN SEEDS, to suit the various sized Gardens, at the following prices:—

No. 1 Collection ...	£3 0 0	No. 3 Collection ...	£1 2 6
No. 2 " ...	1 16 0	No. 4 " ...	0 12 6

FLOWER SEEDS: 50 packets, including the best hardy, half hardy, and tender Annuals and Biennials, with printed instructions, 10s. 6d.; 25 ditto ditto, 6s.; 12 ditto ditto, 3s.

GRASS SEEDS: Fine Lawn Grass Seed 1s. per lb.; Grass Seeds for laying down permanent pasture mixed to suit any soil, 30s. per acre. Every variety of agricultural Seeds of the finest quality. Priced Catalogues may be had on application to W. & G. DAVISON, Seed Warehouse, St. Peter's Street, Hereford.

SEEDS CARRIAGE FREE.

SUTTON'S COLLECTIONS OF SEEDS.—A Clergyman, whom we have had the honour of supplying many years, writes us:—"*I have much satisfaction in recommending your Seeds to various friends, as I find they are much pleased with them;*" and another purchaser says, "*I never received so numerous a Collection, so good in quality, from any house.*"

We therefore confidently recommend those gentlemen who are not themselves acquainted with the best sorts of Vegetables, to order immediately (while we have a large Stock), one of the undermentioned complete Collections:—

KITCHEN GARDEN SEEDS.	£	s.	d.
No. 1. A complete Collection, for one year's supply ...	3	0	0
No. 2. A complete Collection, in reduced quantities ...	2	0	0
No. 3. Ditto Ditto Ditto	1	5	0
No. 4. Ditto Ditto Ditto	0	15	0
HARDY AND SHOWY FLOWER SEEDS (POST FREE).			
No. 5. A Collection of the best 50 sorts known	0	10	6
No. 6. A Collection of the best 36 sorts known	0	7	6
No. 7. A Collection of the best 24 sorts known	0	5	0

SUTTON'S CATALOGUE OF SEEDS will be sent post free.
JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

BASS AND BROWN'S CHOICE VEGETABLE AND FLOWER SEEDS.

For some of the novelties of their first-rate Collections, also choice imported Seeds, Roots for early spring planting, &c., see Advertisements in the Gardeners' Chronicle *of Feb.* 17, *page* 109, *and March* 10, *page* 149.

ASSORTED COLLECTIONS OF VEGETABLE SEEDS, containing the best new sorts

	s.	d.
No. 1, with 20 quarts of Peas, and other vegetables in proportion	60	0
No. 2 Collection, 40s.; No. 3, 25s.; No. 4	15	0

The collections are given in the Seed and Plant List.

FLOWER SEEDS, BEST AND NEWEST ASSORTMENTS, with printed instructions for sowing, &c.

100 vars. choice strong annuals...	15	0
50 vars., 8s. 6d.; 30 vars., 5s. 6d.; 20 vars.	4	0
20 vars. best dwarf kinds, in large packets, suited for beds on lawns, 7s. 6d.; 12 vars....	5	0
20 vars. choice greenhouse annuals, 7s. 6d.; 12 vars. ...	5	0
20 vars. choice greenhouse perennials, 10s. 6d.; 12 vars....	7	6
20 vars. choice hardy biennials and perennials	7	6
12 do. do do do.	5	0

For further particulars see Seed and Plant List.

CHOICE IMPORTED SEEDS, comprising Stock, Aster, Balsam, Cockscomb, Larkspur, Salpiglossis, Scabious, Sinecia, Sweet William, Wallflower, Zinnia, &c.

BASS & BROWN'S Seed and Plant List free by post for three penny stamps. Also the autumn Catalogue for three penny stamps; or gratis to our customers who may not have received them.—Seed and Horticultural Establishment, Sudbury, Suffolk.

MESSRS. E. G. HENDERSON AND SON will commence sending out, on and after Monday, April 30, the following New Plants:—

CALCEOLARIAS (Shrubby or Bedding).

Brunette	7s. 6d.	Norma	7s. 6d.
Coreggio	7 6	Red Rover	7 6
Maggiore	7 6	Vezzosa	7 6
Minnie...	7 6	Wildfire	7 6

Or the set of eight varieties, 2l. 2s.

Full descriptions of which may be seen in the *Gardeners' Chronicle* of last week.

With permission of Mr. C. Turner we shall offer CALCEOLARIA PURITY, the best of the two white bedding varieties, raised and exhibited by Mr. Cole, at 7s. 6d. each, or with the above set 2l. 7s.

HYDRANGEA HORTENSIS, flore pleno, 10s. 6d.—This remarkable plant with double flowers will prove a great acquisition; the colour, as with Hortensis, is either blue or pink, according to the soil or treatment it may receive. The flowers remain a long time on the plant in full beauty.

DAHLIA EMPEROR FRANCIS JOSEPH, 10s. 6d.—This beautiful plant, with constant and attractive white variegated foliage, will give a height amongst variegated foliaged plants that has been much required, 3½ to 4 feet. The double dark coloured flowers over the sheet of white foliage will be quite unique as a bedding plant.

PHLOX QUEEN VICTORIA, 5s.—One of the finest formed flowers, with the free strong growth of the decussata section; splendid truss of blush white flowers, with a conspicuous large purple eye.—Wellington Nursery, St. John's Wood.—March 17.

PAGE AND CO.'S BLIGHT COMPOSITION.—Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra); in Bottles, 1s. 3d. and 2s. 6d. each. Directions for application forwarded. 10 Gallons and upwards Carriage Free to London. Should be in the hands of all Plant and Fruit Growers. See *Gardeners' Chronicle*, March 3, 1855. It can now be obtained of

Messrs. F. & A. Dickson & Sons, 106, Eastgate Street, Chester, and 14, Corporation Street, Manchester
Bass & Brown, Sudbury
Sutton & Sons, Reading
W. & G. Davison, St. Peter's Street, Hereford
Henderson & Co., Pine Apple Place, London
Rendle & Co., Plymouth
Masters & Son, Canterbury
Thomas Davies & Co., Wavertree, Liverpool
Mr. Freeman, Woburn
" J. Perkins, Northampton
" Tiley, Bath
" E. Paul, Derby
" W. Barratt, St. John's, Wakefield.
" Baskerville, Bristol
" Burham, Hastings

and of the Inventors and Manufacturers—
B. PAGE & CO., SEED MERCHANTS, Oxford Street, and Above Bar, Southampton.

N.B.—Other names will shortly appear, as the agents are appointed.

NEW PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer to Amateurs and to the trade his following new plants:—

ACHIMENES (TREVIRANIA), AMBROISE VERSCHAFFELT. This is the finest Achimenes of all: a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 1, 1855. Nice plants will be sent out next May, each 8s.—N.B. One over if three plants are taken.

TYDŒA WARSCEWICZI; magnificent plant for foliage, and particularly for the flowers. It is the finest gesneriaceous plant of all; a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 1, 1855. Strong plants are now ready for sale, each 15s.—N.B. One over if two plants are taken.

RHODODENDRON (HARDY), PRINCE CAMILLE DE ROHAN. This is the finest hardy variety raised; a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 2, 1855. This variety is warranted to be quite hardy, and very free bloomer. Nice plants will be sent out next May, each 15s. N.B. One over if three plants are taken.

Agent in London: Mr. R. SILBERRAD, 5, Harp Lane, Great Tower Street.

NEW EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, beg to intimate to their friends that they ARE NOW prepared to send out AT ONCE good strong plants of WILLIAMS' EVERGREEN CLIMBING ROSE, at 3s. 6d. each, with the usual allowance to the trade, and a still further reduction if one dozen or more are ordered at once. Price may be had on application.

N.B.—Single Plants will be sent free per post on receipt of six penny postage stamps EXTRA to defray postage. Strong Plants of the above may also be obtained at the same price from Mr. CHARLES TURNER, of the Royal Nursery, Slough.

DWARF-BUDDED ROSES,
ADAPTED EITHER FOR POTTING OR PLANTING IN GROUPS.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, have the pleasure of offering fine strong Plants of the following DWARF HYBRID PERPETUAL ROSES, at 15s. per dozen: Baronne Prevost, Duchess of Sutherland, Jacques Lafitte, La Reine, Madame Trudeaux, Pius the Ninth (pillar Rose), Robin Hood.

The following at 10s. per dozen:—Madame Laffay, Marquise Boccella, Marquis of Ailsa, William Jesse.

N.B. A very liberal allowance to the trade on the above.

NEW ROSES.

WOOD'S DUCHESS OF NORFOLK, a superb bright crimson Hybrid Perpetual Pillar Rose, 10s. 6d. per plant. Usual discount to the trade, and a further reduction if six or more plants are ordered at once.

WILLIAMS' EVERGREEN CLIMBING ROSE, 3s. 6d. each. Usual discount to the trade.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, begs to inform Gentlemen, Amateurs, &c., that he can supply them with the following, from a Stock of 20,000 Plants, well rooted, and in robust health, including every choice variety grown.

CARNATIONS, 9s., 12s., and 18s. per dozen pairs.
PICOTEES, 9s., 12s., and 18s. "
PINKS, 4s., 6s., and 9s. "
PANSIES, 4s., 6s., and 9s. per dozen plants.
BELGIAN DAISIES, 4s. and 6s. "
FLUKE KIDNEY POTATO, 5s. per bushel of 56 lbs.
SELECTED PANSY SEED, 1s. and 2s. per packet.
DELPHINIUM BARLOWI, 4s. per dozen.
Auriculas, Alpine Auriculas, Polyanthuses, Primroses, &c.

Priced and Descriptive Catalogues now ready for one stamp. Post-office Orders to be payable at Middleton, Lancashire.

GERANIUM—"ENGLAND'S GLORY."

BAINBRIDGE AND HEWISON have purchased this beautiful bedding Geranium. The colour of the flower is pale flesh, or maiden's blush; the leaf of the horse shoe kind, and very glossy; the individual flowers are smooth, of great substance, and of exquisite form. It is an abundant bloomer, an exceeding large trusser, and throwing its flowers well above the foliage. It resembles much the Hydrangea, and is considered the best Geranium out for bedding or conservatory.

Plants in June, 1855, 5s. each. The usual allowance to the trade when three Plants are taken.—York Nurseries, March 17.

R. SMITH is now sending out his New Seedling Strawberry, SIR CHARLES NAPIER, the best forcing one of the day, admired by all who have seen its growth, and for colour not one to equal it. Price 3l. per 100; 50 for 30s.; 25 for 17s. Also, Sir Charles Napier, British Queen, and Keens' Seedling in pots for Forcing.—R. SMITH, Market Gardener, Richmond Road, Twickenham.

NOTICE TO THE TRADE.

JOHN ADAMS, NURSERYMAN AND SEEDSMAN, High Street, near the Market Place, New Brentford, Middlesex. Nursery Grounds at Acton Green, established several years.

JOHN ADAMS begs to inform his kind friends and patrons that he intends carrying on the above business on a large scale, and begs a continuance of their kind favours, and that nothing on his part shall be wanting to give entire satisfaction.—Brompton Park Nursery. March 17.

THE ANNUAL SPRING EXHIBITION OF PLANTS IN THE EXETER NURSERY.

LUCOMBE, PINCE AND Co. very respectfully beg leave to announce that their superb specimens of CAMELLIAS are now in flower; they are particularly fine this season, and great additions have been made to their collection. Their New Show House is also filled with an extensive assortment of various Fine Plants, which cannot fail to gratify those who pay their Nursery a visit, as it is now, and will continue for a long time to be exceedingly brilliant and attractive with all the gayest Spring and other Choice Flowers.

L., P., & Co. have now several experienced Gardeners whom they can strongly recommend.—Exeter Nursery, Exeter. Mar. 17.

The Gardeners' Chronicle.

SATURDAY, MARCH 17, 1855.

The CLIMATE OF THE CRIMEA has lost none of its interest. The army has passed through the perils of December, January, and February, which have proved to be such as we long ago anticipated. March has now arrived, and it is thought probable that the troops will be before Sebastopol at least till the end of June; so that four or five months' experience of a Taurian spring and summer has still to be gained. Two translations* of Professor KOCH's work on the Crimea having just issued from the

* *The Crimea, with a Visit to Odessa.* By C. W. KOCH. ROUTLEDGE; pp. 183, with woodcuts. 12mo (1s.).

The Crimea and Odessa: Journal of a Tour, with an Account of the Climate and Vegetation. By C. W. KOCH. MURRAY; pp. 323 with a map of the country and woodcuts. Small 8vo.

press, we possess the means of furnishing the reader with some information upon that subject also. In our quotations, we avail ourselves of Mr. Routledge's translation, which we much prefer.

Professor Koch, after spending some years in the Caucasus, passed into the Crimea by way of Kertch, the land of Circe and Mithridates. Thence he proceeded westerly to Kara-su-Bazar and Sympheropol, after which he turned to the south, visited Sebastopol, Balaclava, and the south coast up to Orianda, where there is an imperial palace, and finally doubling back as far as Aloushta, he again reached Sympheropol, whence he proceeded through the dreary steppes and pampas to Odessa, by way of Perekop. In the book before us he gives an account of what he saw and learned in the course of his journey.

It is impossible to read his pages without arriving at the conclusion that the Crimea is destitute of everything that can render it valuable except as a military position. The vast plains north of Sympheropol are almost uninhabited and utterly barren; between Perekop and Sympheropol he did not see a single herd of cattle or flock of sheep; human beings were only visible at the post-houses.

"A plain," he says, "such as is found in the north of the Crimea and in the south of Russia, affords the most melancholy prospect in autumn, when all vegetation has disappeared, and only the varieties of Wormwood and Horehound, or a few Centauries, can be distinguished. The only feeling to which we could yield was that of boundlessness, which was grand, even in this melancholy desert. Wherever we turned we could only perceive the far distant horizon, without a single point on which the eye could rest, even for the shortest space of time. In spring, indeed, a very busy scene is presented. Many thousand sheep and oxen, followed by shepherds and dogs, traverse the steppe, and feed on the juicy herbs. But when the last days of June arrive, the Tatars with their flocks draw nearer to the south coast, and spend the time from July to the season when the rain is turned into snow, upon the Crimean mountain range, where a healthier and fresh pasturage is afforded them."

On the south coast it is better, the country being rugged and picturesque, though sterile; the country houses there of the Russian nobles seem to be maintained merely as an occasional retreat, or in obedience to the desire of the Court of St. Petersburgh. We are assured that the Tatar population is reduced to 60,000 souls, and that the whole country is incapable of supporting a million of persons without external aid.

The climate is thus described:—"The south coast has no real autumn, but a double spring, in so far as by spring we understand the reproduction of vegetation. The actual spring, which agrees with ours as regards season, at times lasting from the middle of April to the middle of June—more generally, however, beginning in March and ending in May—is not the finest part of the year, as it is with us: the greatest variation prevails here in every respect. This the south coast shares in common with many Eastern countries. At the beginning of March there is frequently splendid weather, and the vegetation makes extraordinary progress; when, suddenly, cool, even cold weather, sets in in April, and the thermometer frequently sinks below zero. (32° Fahr.) It seems as if winter were recommencing.

"The autumn, which seems like a second spring, is far more pleasant. A portion of the shrubs and trees put forth new shoots, and even are covered with a fresh display of foliage. Towards the end of August, the heat generally decreases, and autumnal days set in: rain alternates with wind and fine weather. Towards the equinox the wind becomes a storm, frequently a hurricane, and causes the most fearful desolation. At this season there is a good deal of rain. The soil which, till the beginning of spring, was parched and burnt up, eagerly imbibes the moisture. Springs which, at the end of August, were quite dried up, begin to flow again. In case it has rained itself out—to use the common phrase,—by the 5th or 6th October, the sky is suddenly cleared, and the most beautiful weather in the whole year sets in. While the last half of October, November, and December are frequently a very disagreeable season in Germany, on the south coast it is the most pleasant in the year, and the vegetation is very luxuriant. These regularly beautiful days last till the second half of December, and very frequently till the new year. From that period, wind and rain again alternate with sunshine. The thermometer vacillates between 36° and 46° [we change the scale of Réaumur to that of Fahrenheit], falls at times below 32° but rises also to 54°. The rain at times changes into snow, which rarely lasts longer than an hour, and melts as soon as it has fallen. Towards the end of February, or beginning of March, extreme cold sets in, and the thermometer not unrarely sinks 20° or 30° below freezing point. In the middle of March, there are frequently several fine though cold days, which last for a week or more. At the vernal equinox, another change occurs, which is generally accompanied by a fall in temperature. The mercury sinks sometimes to 38°. The period from the end of January to the middle of April, however, varies in other years from the rule I have just given. There have been years when there was hardly any cold in February, and the winter was at an end. This reminds me forcibly of the climate of Tiflis, where I spent the winters of 1836-7, and 1843-4. On the 20th January, 1837, I spent the night in the open air, without any extra clothing, during a shooting excursion. It was at that time lovely weather; the Almond trees were beginning to blossom, and on the 18th of February they were covered with splendid flowers. In the middle of April, on the contrary, it was so cold that I did not dare to go out without a great coat.

"On the south coast of the Crimea, the weather was fine in 1843 up to the 17th March; the thermometer had never once fallen to freezing point. In January it stood once at 66°, in February at 63°. A frost suddenly set in on the 18th March, and the mercury fell to 8°. It was not till the 29th March that milder weather set in; and at the beginning of April, the thermometer showed 36° of warmth. In 1844, the winter was generally mild; but on the 11th April the mercury fell to 34°, and on the 13th to 25°. In the year 1840, there were 18° of cold on the first Easter festival.

"It can be easily imagined that such a variable climate has no good effect on the vegetation. A quantity of shrubs and trees, which flourish in England in the open air, will not grow at all, or only very sparingly on the south coast."

"The spring only lasts for a short space. In the Crimea it generally begins with the first days of March, but at times much later. The vegetation is rapidly developed, in spite of the night frosts, and collects in the steppe that energy which enables it to resist a long, lasting heat, or else dies away in a few months, as is the case in the pampas. In proportion as the soil is covered with plants, the longer do they maintain their verdure, but whenever they die away rapidly, as in the pampas, the ground grows heated with extraordinary rapidity; an exhalation of heated air commences, which continues even during the night, and is scarcely ever interrupted. As the countries on the Black Sea and Sea of Azov possess the least vegetation, there is scarcely any rain there during the whole of the warm season. Most fearful storms frequently rage over the adjacent sea; the rain pours down in streams there, but not a drop falls on land.

"With each week of summer, the heat becomes more insupportable. At the outset, the sky is of the purest azure; it only appears more or less overcast over the larger rivers, where continuous evaporation is taking place. Soon, however, the pure colour disappears; it becomes daily more milky; and that haze sets in which is frequently visible in our country in hot days, but which is much more prominent in the south, especially over deserts. In July, all the water in the pampas and the adjacent country is evaporated; in the month of August and beginning of September, water is sought for in vain in the steppe regions, except in the vicinity of large rivers. Here, too, the vegetation gradually dies away, and the stems of the plants, 6 or 8 feet in height, are alone visible, which the Russians call Burian, and apply to all sorts of purposes, but principally as fuel for the winter.

"In the middle of September, cooler weather sets in, in which the trade winds cease blowing, at least for a short period, in the unwooded zone, and produces a change in the temperature: with this a fresh vegetation commences. The buds for the next year are not only formed on perennial plants, but many of them are covered with a new coat of verdure. In October, there is a considerable quantity of rain, and the ground grows so soft that there is great difficulty in walking over it. In November, it grows colder, and storms set in, of which we can form no idea. Whirlwinds are very frequent, and cause an immense amount of destruction. In December the winter generally commences, though frequently without a flake of snow falling. The cold is, consequently, much more severely felt, and principally by the plants, of which immense quantities are killed. There are winters, on the other hand, in which a great deal of snow falls. The storms at this season are terrible, and the wind generally blows from the east and north-east, at times for more than half the year, and not unfrequently becomes a hurricane. It raises the dust aloft, and drives it before it in the shape of a pillar; but it is much worse if snow is lying, as the entire mass is raised up a in whirlwind and carried away. Woe to the flock which is surprised by such a snow-drift (called samet by the Russians). The cattle are terrified, and disperse in every direction. It is almost impossible to see a step before you, and the road is continually lost. As a snow-drift at times lasts several weeks, though usually only three days, sheep and oxen, and frequently men, cannot find their homes, are exhausted by terror and hunger, and finally perish from cold. It is a very frequent circumstance for sheep to run right into the sea or large rivers, and be drowned. The sheep, also, in such cases, are continually devoured by wolves.

"No less dangerous are the snow-storms (Wyura among the Russians), even when only a gentle breeze is blowing, or in a perfect calm. A darkness frequently sets in, so that it is impossible to see ten paces before you. Any one who does not possess a good knowledge of the locality—I might say instinct—can easily miss his road, and be exposed to extreme peril."

This gives an idea of what the troops have before them.

The Crimean trees are not yet well known, but we have no doubt the present occupation of the country will bring us better acquainted with them. According to Koch, one of the commonest Oaks is *Quercus pubescens;* but we already know from evidence furnished by one of our gallant friends on the spot, that the scrubby Oak which abounds near Sebastopol and on the Tchernaya, and among which the battle of Inkermann was fought, is by no means the species so called in Europe, but one which is peculiar to the East. It has sessile amplexicaul leaves, without the midrib projecting beyond the margin; the acorns are sessile, and the cups those of the Turkey Oak. According to Koch it never grows more than 40 or 50 feet high, but branches immediately from the ground, so as to form a giant bush. The same plant was found by Mr. Bentham in the forest of Belgrade, near Constantinople, and occurs among Kotschy's ill preserved Cilician collections. Within the lines of the Allies it bears no acorns. Possibly in a climate like ours it would develope in a more perfect manner.

According to Prof. Koch the scrubby Juniper of the country is the *Juniperus rufescens* of Link, and he describes it thus:—

"The nearer we drew to the promontory, the extremity of which forms Cape Aithodor, the less fertile did the soil become, and the indigenous bushes, especially the Oak and the Eastern Hawthorn, were very scrubby. Gradually, too, the Juniper with bright red berries (*Juniperus rufescens*, Link) made its appearance, which for so long a time was confounded with the Juniper Cedar (*Juniperus oxycedrus*, L.). At the commencement of our walk this bush was a very fine object, and in size like that of the Cypress, although, instead of fleshy scales, it bore needle-shaped leaves. Like the tall Juniper, this variety also likes rocks, and above all a soil covered with triturated rock. Where it is very sterile, and a strong wind blows, it lies on the ground like our Savin tree, and its branches grow upwards." Our correspondent, in sending specimens to this country, observes that it is very common about that place, usually growing 3 to 4 ft. high, but sometimes much more; it has a very spreading habit, and extremely sharp leaves. The cinnamon brown fruit is abundant, and contrasted with the green of the leaves produces a very lively and pleasing effect. This, we presume, is one of the plants whose roots the men grub up for fuel. It is very like *J. oxycedrus.*

Another tree near Balaclava is described by our friend at Balaclava as one to be much admired. Its colour is beautiful, its form graceful, and its dark berries hanging in profusion on the branches produce a charming effect. About Balaclava it forms a spreading head 20 feet high and upwards. Koch thus describes a specimen seen by him at Orianda—"Further in the front, and just on the verge of the precipice, stood a splendid specimen of one of those Junipers (*Juniperus excelsa*, Bieb.), which instead *of needle-shaped leaves, like the Arbor-vitæ or the Cypress,* have close-pressed pulpy scales, and of a larger size than I ever saw in the Crimea, though I had found similar ones in the valley of the Tchoruk; the trunk itself was no less than [illegible] feet in diameter. If we bear in mind that the Juniper grows very slowly, indubitably it has required more than a thousand years to attain such a size. It is, consequently, the only tree which saw all the various nations come and again depart at the period of the great migration."

Whether this is the same as the tree called *J. excelsa* in this country is extremely doubtful. The words in italics being rendered in the same sense in both the translations before us must be taken to be the words of the author: but what they mean we cannot say.

By the same opportunity we have received from our active correspondent ripe seed-vessels of the

Christ's Thorn (*Paliurus aculeatus*) gathered near Balaclava, a Syrian shrub which is unable to bear a hard English winter; together with specimens from the highest ground of a Lichen, which is probably a form of *Lecanora tartarea*, our Cudbear, in the condition called *Isidium corallinum* by botanists, and approaching the Armenian Manna, or *Lecanora esculenta*, formerly figured in our columns (see 1849, p. 612). He also finds near the soldiers' huts in great abundance a little land-shell which our friend Mr. Westwood refers to *Bulimus tauricus* or *parnensis*, a genus extending from Italy to India.

All these bits of evidence tend to show that the vegetation of the Chersonese and adjacent country is such as indicates a Southdown climate at the worst. Of course on the plateau above Sebastopol the cold is very trying to the troops, and so it would be if the works of the Allies were constructed upon the hills round Folkestone. We may add that the other information contained in Professor Koch's book, to which we must refer the reader, wholly confirms the statements already made in this journal.

In our columns for 1854, p. 299, we gave a full account of the manner of cultivating that stubborn hedge plant called in the United States the Osage Orange (Maclura aurantiaca). But it turned out that the supply of seed which was then expected never arrived, and those who desired to try the shrub where an impenetrable live fence is wanted, were disappointed. We are now able to announce the actual arrival of a considerable quantity, which is held by Messrs. Charlwood & Co., Seedsmen, Covent Garden, of whom it may be procured. The article above referred to is too long for re-insertion, and therefore we are obliged to refer the reader to its place.

It is now officially announced that the Imperial and Central Horticultural Society of Paris will hold a permanent exhibition in that city, in connection with the Exhibition of all Nations, from May 1 to Oct 31. Rules and regulations are not yet issued, but are promised very shortly. As soon as we receive them we shall make them known. In the meanwhile communications should be addressed to "Mons. Léon le Guay, Inspector of Imperial Parks and Gardens, 17, Rue du Cherche-midi," who acts as Secretary of the Horticultural Committee.

New Plants.

— 119. Cœlogyne micrantha.

C. (? filiferæ) pseudobulbis oblongis angustis diphyllis, foliis lineari-lanceolatis racemo sessili (?) basi imbricato longioribus, sepalis ovatis æqualibus, petalis filiformibus brevioribus, labelli trilobi lobo medio subrotundo emarginato, disco lamellis pluribus in fimbrillis solutis apice bilamellato basi bidentato.

We owe our knowledge of this curiosity to Mr. A. Dick, gardener at Dale Park, where it had been received from "the East Indies." It is probably from some Malay island, since it approaches nearly the *C. miniata* of Java, which has, however, a lip with a pair of elevated lines. In this, on the contrary, the whole face of the lip is broken up into fringes, except at the point where two short plates stand apart, and at the base, which is furnished with two teeth and an intermediate ridge. The flowers are very small, pale brown, with the back of the lip marked with the sooty brown stains so characteristic of the filiferous Cœlogynes. Not worth cultivation.

120. Posoqueria revoluta, *Nees. D. C. Prodr.* iv. 376.

This beautiful Brasilian stove shrub was exhibited a fortnight since in the rooms of the Horticultural Society by Messrs. Veitch. It has fine Laurel-like leaves, and clusters of graceful snow white flowers, the tube of which is more than 3 inches long. The specific name was given upon the supposition that the leaves have their edges rolled back, but this occurs in so slight a degree as to cause regret that so fine a plant should not bear a more characteristic title.

VEGETABLE PATHOLOGY.—No. LXIII.

282. Apostaxis. *Constitutional or Accidental.* 5. Discharge of manna. Manna is a sweet substance, resembling sugar in chemical constitution, but differing principally in its indisposition to fermentation, and yielding mucic or saccholactic as well as oxalic acid when digested in nitric acid. All manna is not, however, identical in composition. The manna produced as mentioned below by a variety of Tamarix gallica does not, in fact, contain sugar possessed of the peculiar properties of manna sugar, but those of glucose, or Grape sugar. It exudes naturally from many different trees in warm countries, or in more temperate regions during unusually warm weather, but those trees which produce it abundantly under high degrees of temperature, are entirely unproductive in less genial climates. The manna of commerce is produced principally from Fraxinus ornus, either oozing naturally from the bark, or from artificial incisions. Grafted trees are much more productive than others, in all probability, as Meyen believes, because the sap, in general, does not descend so rapidly in grafted trees as in those which are left in a state of nature. The manna which drips from the Larch in the form of little beads, is known under the name of Manna of Briançon; it is, however, very inferior in consequence of its containing a large quantity of turpentine. Eucalyptus mannifera produces manna very similar to that of the Calabrian Ash, of which importations are made for medical purposes. A variety, of which little is known, has also been brought from Botany Bay in the form of snow white globules, collected from the ground in large quantities, identical probably, or nearly so, with the manna tears produced in our own country in very hot summers from the Elm and other trees, from which it occasionally falls in such quantities as to be capable of being swept up like little hailstones where there is a smooth area beneath the branches. In countries where it is abundant manna is collected as an article of food, for its purgative qualities seem to be slight when it is freshly gathered, and to increase with age, and are at any rate not such as greatly to interfere with its use. The Bedouin Arabs in the neighbourhood of Mount Sinai collect it for food from Hedysarum Alhagi, and it is well known that a variety of Tamarix gallica produces the same substance in those districts. In the latter case, and probably in some others, the production of manna is due to the agency of an insect, Coccus manniferus, and it has been asserted also that Cicada orni produces the same result in the Calabrian Ash.

283. It appears then that the discharge of manna may take place naturally without any organic lesion, as from the stomates, having first oozed through the walls of the cells; it may accumulate beneath the bark in such quantities as to find a vent by rupturing the superincumbent tissues; or it may be due to pure accident or to the agency of insects. As in other cases of Apostaxis the urgency of the case depends entirely on the extent of the symptoms, and it is probable that the discharge is never so great naturally as to prove really injurious. Where it is separated from the leaves in hot weather, it is doubtless a relief of a plethoric state of the system which might prove fatal without some outlet, and in other cases, except possibly in some instances where it is due to insects, it is quite harmless.

284. It has been attempted to show that the supply of manna to the people of Israel in the wilderness, may have been derived from the Tamarix; but a very slight degree of reflection would show that this notion is entirely inconsistent with the scriptural account, the very essence of which is that its origin was miraculous. It may be mentioned also that a species of Lichen (Lichen esculentus, Pallas and some other species) has been supposed to be the manna of Scripture. It is found in Armenia, Algiers, and other districts, lying in dense masses on the ground, and there are accounts worthy of credit, which show that it is sometimes taken up from the surface in whirlwinds and deposited again after a journey of many miles. This substance has not, however, any of the properties of manna. It is used in times of scarcity to grind with Wheat, and whatever nutritive matter it contains must depend almost entirely upon the Lichen starch which enters into the composition of its cellular tissue. At best it is a very poor article of food, dangerous to some constitutions from the immense quantity which it contains of oxalate of lime, and could only be used where there was a great deficiency of better commodities.*

285. A very curious affection has occurred for many years past on the leaves of Stenocarpus salignus and of several Myrtaceæ in one of the houses at Kew. At first there is a rather copious exusion of transparent sugary matter both from the upper and under surface of the leaves. This spreads in little round patches, on which pure white byssoid radiating lines soon make their appearance, but little elevated above the surface, and interrupted once or twice in their growth, after the manner of the mycelia of many of the higher Fungi. At this stage, the white matter is found to consist of moniliform threads, whose articulations are oblong from $\frac{1}{2500}$ to $\frac{1}{2000}$ inch long, and containing two nuclei. They resemble, in fact, very closely the reproductive bodies of Ergotetia arbortifaciens, Queckett. In some cases, in addition to these bodies, there are others far more minute,* and sometimes the whole substance consists of these lesser granules. A change now takes place, which gives the production an appearance very similar to that of manna. The byssoid lines become gradually confluent, and lose their filamentous aspect. The edges of the little mass become swollen and granulated, till at last small, more or less orbicular, pellets are formed, still of a pure white, easily separable from the leaf, and having much the appearance of the sugary efflorescence which occurs on large seaweeds. Under the microscope, however, the mass consists of a multitude of acicular crystals, mixed with a few of the original granules. The exact nature of these crystals I have not been able to ascertain, but they do not consist of carbonate of lime, and therefore are not due merely to the water with which the plants are syringed.† The secretion is confined to a certain number of plants; and since some change has taken place in their position, it is not produced in so many species as it was formerly.‡ *M. J. B.*

* An interesting account of this will be found in this Journal, 1849, p. 612.

† Since the above was written, the substance has been kindly examined at my request by Dr. G. Owen Rees. The quantity submitted to his inspection was necessarily very small, and insufficient for any very extended chemical analysis. The crystals are soluble in water; little, if at all so, in alcohol; they yield an alkaline ash on incineration. The probability is, then, that they are some salt arising from a vegetable acid combined with potash or soda, most likely the former. Their solubility n water forbids their being oxalate of lime.

‡ It has occurred on Stenocarpus salignus for more than 20 years. Mr. Smith informs me that he has observed it on Callistemon speciosum and several other Myrtaceæ, but never in the same abundance as on the Stenocarpus. At the present moment it is confined to that species. The Myrtaceæ, it should be observed, are now in a different house from the Stenocarpus.

SEEDLING RHODODENDRONS.

In the matter of seedling Rhododendrons "J. R" is certainly behind his time. He would have us go back a quarter of a century, and repeat labours now almost forgotten; labours, nevertheless, in themselves of the highest value, and from which the hybridizer of the present day has reaped, and is still reaping, the greatest assistance, but which it would only be a waste of time to repeat.

Seedling Rhododendrons but once removed from arboreum are, as a general rule, wholly valueless for out-door cultivation. In the first place they are generally from 20 to 25 years old before they flower; and from the fact of such flowers, when they *are* produced, expanding very early in the year, it is only in the most favoured seasons, and in a few localities, that they come to perfection without artificial protection; not that the plants themselves are not hardy, but the flowers, in which, of course, the chief attraction of the plants lie, are destroyed. We could name many gardens where there are fine specimens of such early flowering kinds, and where, in the majority of seasons, they never expand a flower. We recollect one in particular on the south coast, where the Myrtle hardly requires protection, but where, nevertheless, these early flowering Rhododendrons rarely perfect a head of bloom. The plants, retaining too much of the constitution of arboreum, are excited by a few prematurely warm days in February to lose, as a natural result, by the first severe frost afterwards, their expanding blossoms. The qualities that Rhododendrons for cultivating in the open air should possess are, hardiness of constitution, handsomeness of foliage, freedom of growth, richness and variety of colour, precocity and abundance of flower, and the power of remaining inactive in growth till the danger from spring frosts is over. All who are acquainted with even a small part of the hybrids in cultivation know well enough that plants possessing these qualities are abundant.

Now, although it is found desirable, both as a means of inducing rapidity of growth and earliness of bloom (by earliness we here refer to the *age* of the plants) as well as by its affording a ready means of propagation, to graft seedlings, even though they possess the above desirable qualities; they are, nevertheless, very precocious in the production of flowers without grafting. How "J. R." can give to such plants as he very justly observes are often 20 years old before producing a flower, the preference over those we have been describing, we are at a loss to understand. But there is no accounting for tastes, and every one has an undoubted right to entertain and to advocate his own ideas upon any subject, however eccentric they may be.

As we have before observed, seedlings from Rhododendron arboreum do not usually flower before they are 20 or 25 years old; yet these are the plants that "J. R." wishes to see in place of the hybrids now so generally cultivated. If to produce a mass of evergreen be the result sought, there are very many other shrubs much better suited for general cultivation by which such may be attained; and if flower be the object, we do not see how a preference can, even in a remote degree, be claimed for them. This we do know, that among a pretty extensive connection, we never yet found the purchaser who would order them for cultivation in the open borders. Plants that will flower abundantly and at an early age are invariably stipulated for; and in good truth it would be a folly in any one to purchase a plant that would require 10 years to produce a scanty crop of flowers, when for the same money he could purchase one that would abundantly reward him in one year.

The most abundant as well as the most precocious bloomers as species are the following, which are placed in the order in which they are entitled to priority, viz., ciliatum, glaucum, caucasicum, catawbiense, ponticum, and purpureum; while arboreum and its varieties possess the opposite qualities, but which, as regards season, are the earliest to produce their flowers. The latest bloomers in the season are maximum, catawbiense, ponticum, and purpureum. The hardiest are catawbiense and maximum, the former standing first in this respect.

From what has been said it will readily be seen that if free-blooming qualities are desired in a hybrid Rhododendron, it must be removed as far as possible from maximum and arboreum; while the nearer its parentage is to ciliatum or either of the six following named above, the more will it partake of that desirable quality. For late-blooming qualities the hybridiser must employ catawbiense, maximum, ponticum, and purpureum; while arboreum and maximum will afford him the richest as well as the most delicate tints.

The primary defect, as hardy plants, of all the first hybrids from catawbiense, caucasicum, and ponticum, by arboreum, is their early blooming propensity, the consequences of which we have before alluded to; and in those from maximum by arboreum their extreme shyness in producing flowers detracts very much from their usefulness; for when you do get a head of bloom from them, it is indeed extremely beautiful, but it occupies almost a life-time to realise such a result. As an instance we may mention that some years since we were admiring a solitary head of bloom in a large bed of Rhododendrons at Highclere, when the gardener informed us that the whole of the plants were hybrids between maximum and arboreum, that they were 26 years old, and that the head of flowers we were then admiring was the first

and only one that had been produced. We could name many similar instances if it were necessary.

Among first hybrids the earliest (as regards age) and most abundant bloomers are those of which caucasicum, or a near hybrid of it, is one of the parents; next in order come seedlings between ponticum and arboreum, and following these crosses between catawbiense and arboreum. The defects of these we have just pointed out. Now, if a cross between a hybrid arboreum and a hybrid from one of the above crosses be again crossed with either of them, the plants resulting will be perfectly hardy, and produce flowers at a very early age, and the nearer they are to caucasicum the more precocious will they prove. From such crosses a great part of the hardy hybrids in cultivation have sprung. But the most abundant bloomers, and such as flower in the youngest state, are plants raised from a third cross by a third cross.

The shyest-blooming hybrids are those in which maximum is a parent. Hybrids between a hybrid caucasicum and a hybrid arboreum will bloom when about six or seven years old; and seedlings from a hybrid ponticum, say Smithii, by catawbiense, will flower at about the same age.

By a careful selection of breeders and a due admixture of the qualities of each, the present race of beautiful hardy hybrids have, after years of labour, been obtained. Would "J. R." have us then throw these out of cultivation, and grow nothing but his favourites, which require 20 years of cultivation before they condescend to show colour! Surely not; yet from his letters we can only infer as much.

In the course of many years' practice in hybridising the Rhododendron we have observed very curious sports and crosses, some of which confirm, others entirely overthrow, the received opinions as regards the results of hybridisation among plants. These we shall, if desirable, be very glad to record in another article. *Standish and Noble.*

COMMON THINGS.

Propagation of Figs.—Figs are propagated by cuttings and by layers. The latter method is the best, as plants at the end of a year are fit to take up from the stools, and to plant out where they are intended to remain. Cuttings taken from plants from which layers cannot be obtained may be planted singly in pots, and placed under a frame, in a gentle heat now, and they will make good plants by the end of the year. The best of all methods, however, for obtaining fruiting plants quickly is the following. Take a Potato, cut it in half, and scoop out of each half enough of the Potato to permit it to be fastened round the stem of the intended cutting. Then select a good fruitful branch with two or three shoots on it, fasten the Potato round the stem where you are desirous roots should form, and cover it with moss. The moisture afforded by the moss and Potato will soon cause it to emit roots, when it may be removed from the parent tree and potted. In this way you may make tolerably sure of having a fruitful tree.

Seakale from Seed.—Its seeds should be sown in March or April, thinly upon a bed in an open part of the garden, keeping the plants clean from weeds through the summer. In the following spring they should be taken up carefully, and, shortening the roots to 8 or 9 inches, they should be planted out on good well-trenched ground, in rows 4 feet apart, and the plants at 18 inches distance from each other, placing the crowns of the roots 2 inches below the surface. This may be considered as a regular distance for the crop, but a smaller sized root may be planted between each of the others as an intermediate plant, which will increase the crop for the first two or three years without injuring the rest; afterwards they may be removed, leaving the original number at 18 inches apart. At the end of the first year after planting out the heads may be forced by means of large pots being placed over the crowns, and covered with hot dung. It should be observed that immediately on cutting the forced heads they should be brought to a level with the surface of the ground, or else in the course of a few years the plants will form their crowns so high that it will be necessary to earth them up to preserve them from the effects of severe frost. Should young plants not be at hand when a new plantation is required to be made, cuttings from the roots of the old plants of 2 or 3 inches in length will answer the purpose equally well as plants, for every inch of root will grow if planted near the surface, and the stronger these pieces are the stronger will be the plants at the end of the year.

TRADE MEMORANDA.

Beware of foreign hawkers offering wonderful plants for sale.

Home Correspondence.

Masson's Patent Mode of Preserving Vegetables is a striking instance of the usefulness of even trivial articles that have appeared in your pages, for his method is little more than the extension of a common Russian practice that was noticed in the *Gardeners' Chronicle* some years ago. It was therein related that green Peas and green French Beans were habitually preserved for winter use by first scalding them slightly, then drying them, the French Beans having been previously sliced, as is usual in preparing them for the table. Mr. Masson's exposure of vegetables to steam is more simple than the throwing them for a moment into boiling water, as is practised in Russia; but both modes are productive of the same effect. Mr. Masson presses the vegetables to diminish their bulk, but in Russia their original form is retained, that they may the more nearly resemble fresh green Peas and fresh French Beans, and they are commonly sold in all the provision shops in St. Petersburgh. It seems remarkable that this well-known mode of preserving green Peas and French Beans has not before been extended to other vegetables. *B.*

Temperature of February in Berwickshire.—The following table represents the extreme cold and heat which we had here during the 28 days and nights of February last. It has been prepared from data furnished by a registering thermometer, which I have used for these last six years, and which has always been found to be correct. It stands 2 feet to the north of a large Portugal Laurel, clear of all other objects, and is fixed to a board 16 inches by 13 inches, sided with a 2-inch deep frame to throw off wet, and screwed to a post 4 feet above the ground. It faces the north. The ground was completely covered with snow a foot deep all around it from the 14th to the 24th of February. I may mention that the Portugal Laurel behind the thermometer—a beautiful bush, 14 feet through and 10 feet high—has been killed down to within a few inches of the ground; the old stems, 18 inches in circumference, not escaping, although thickly covered

Days of the month.	Lowest night temp.	Highest day temp.

with leaves and branches down to the bottom. In the above table it will be seen that the day temperatures are all above zero. The degrees are numbered from zero each way as shown on the thermometer, and as they ought to be, not from 32°, the freezing point: for instance, on the 17th February the lowest temperature marked was 20° below zero, making 52° of frost; and the highest that day was 20° above zero, showing 12° of frost in the warmest part of the day. The above will serve to confirm my remarks in the *Gardeners' Chronicle* of March 3d. The young wood of Apricots and Peach trees on walls is all killed, as are also parts of the old wood. French Pears, standard trees, and many other things are likewise killed down to a foot above the ground, or to where they were protected with snow. *C. Kay, Blackadder Gardens, Chirnside, N. B., March* 10.

The Fluke Potato.—It is not, I am aware, usual to find fault with advertisements unless it is evident that they contain a misrepresentation tending to mislead, but finding that one in your last publication states that "they (Fluke Kidney Potatoes) do not bear cutting," I beg in opposition to such a statement to give you the result of my experience in the matter. Having received a quantity of the above variety last year from Yorkshire, one-half, at least, of which weighed between 3 and 8 ounces each, it seemed to me that it would be wasteful to plant them whole; I therefore had them lightly covered with earth, and as soon as the eyes were started I had the tubers cut into sets, having one and two eyes each, and neither from the produce nor the appearance of the plants could any difference be perceived. Knowing that a large quantity of similar seed has been sent out this season, I have related the above, in order that the purchasers of it may not be induced to commit such a piece of useless extravagance as to plant whole Potatoes. *E. Wilkinson, Ealing.*

Pear Culture in Scotland.—I read with interest M. de Jonghe's papers, and I wish that his views could be realised; it would be very pleasant indeed if one were able by judicious culture to beat unfavourable seasons, and always secure a good crop of good fruit; but it remains to be shown how this is to be done, and, till that be, we must look upon it as a happy delusion. It is absurd to reason from Belgium to England—their climates differ so much. As he insists on having the trees wrought standard high, I beg to give what little experience I have of the matter. Seven years ago I got a number of Pear trees, pyramids, on the Quince stock, and being in a nursery in my neighbourhood, where there were some Pears on Pear stocks for sale, with stems 6 and 7 feet high, I bought some of them for trial. The trees are all in the same kind of soil, are well taken care of, and properly pruned, but I have never yet had a solitary fruit from the tall trees, although they have had abundance of blossoms every year. Bad as the seasons here have been, I have always had some fruit from the pyramids, and sometimes very good crops. The tall trees are growing in the same soil, are of the same age as the pyramids, and in a most healthful and vigorous condition, yet they will not give me fruit. I attribute this to their height; they are more exposed thereby to the force of cold winds and frosts than their more humble neighbours; and the lower pyramids and bushes are in a more comfortable condition and more easily escape. One can understand a fruit tree being made to grow on a tall stem in orchards where there is much undergrowth, such as Gooseberries, Currants, or tall vegetables; but if there be no undergrowth to prevent due circulation of air, I can see no purpose whatever in having the head so far from the ground except bad ones. Tall trees certainly do not set their fruit so well as those that are low; and if the wind blows off and destroys their fruit in the north of England, how much more here in Scotland are we exposed to its ravages? It is difficult to see, too, how these long-legged trees are to be so nicely pruned as M. de Jonghe describes, for they are so difficult to get at, and to prune them without damaging their buds would require either a cat or a monkey for a gardener. My objections then to these trees are that they are very ugly, bad to get at, don't set their fruit well, and will not show what they do set; and I would say more, that in a soil like mine it is hardly possible to keep them on their legs, as in heavy rains with strong wind, which we have usually in October from the north-east, they are apt to get tilted over. I am now going to say something about the pyramids: I planted, I think, about 20 varieties of these on Quince stocks. The sorts which bear freely with me and ripen their fruit are Citron des Carmes, Williams' Bon Chretien, Louise Bonne of Jersey, Soldat Laboureur, and Beurré Rance; I have always some Pears of these sorts, and frequently good crops. In the autumn of 1853 I had 12 dozen fine fruit on two small pyramids of Louise Bonne of Jersey, 12 dozen on one tree of Beurré Rance, large and very fine, 20 dozen on two trees of Soldat Laboureur (this is like Beurré d'Aremberg in its fruit, but does not grow quite so vigorously, and bears more freely). I do not know what size your Pears get to in the south, but suppose they must be much larger than we can raise here; however, Williams' Bon Chrétien, from pyramids on the Quince, measure about 9 inches round, and when ripe is wonderfully juicy, indeed it is impossible to cut it without losing a great deal. The Glou Morceau will not ripen as a standard; on the wall, on a Quince stock, it yields good fruit and bears well. As a standard Marie Louise is not hardy, and will not ripen its fruit with us. Now I have to say something further in favour of low standards. I would prefer bushes to pyramids, and several of my trees I have in that form, for they escape winds and frosts best of all, and I always see that the finest fruit is lowest down if not shaded or choked, which I do not allow. My rule is to keep the tree as close to the surface as possible, to let nothing trench upon its position, but to let it have room and plenty of light and air. I grow all my Apple trees on this plan; they are low bushes: branches in autumn are often resting on the ground, and the fruit on these branches is of the best quality. It is warmest near the surface—it is warmest there at night from the radiation of the heat from the ground, and warmest there during the day from reflection of the sun's heat. Being near the ground gives the tree something of the advantage of being near a brick wall; for it is close to an earth wall. When the tree is at the top of a pole, as in those high standards, it loses every advantage, and is subject to great disadvantages. *R. O. B., the Manse, by Coldstream, N. B.*

Swede Turnips as Food.—At this season of scarcity of vegetables, in consequence of the late severe weather, it may be useful to know that the common Swede Turnip, such as is given to cattle, makes a most excellent dish for the table. I use it regularly at my own table, and it is greatly approved of. The only treatment different from that of the common garden Turnip is that it requires to be boiled a much longer time, to make it perfectly soft—from seven to eight hours. It is then strained, and mashed in the usual way, with the addition of pepper and salt and a little cream or good milk. A 10 *years' Subscriber, York.*

American Axes.—In your paper of March 12th you doubt whether these can be obtained in London. Permit me to state for your information that I keep a large stock of the genuine Samuel W. Collins' axes, which are so much sought after in all our colonies. *Joseph Fenn*, 105, *Newgate Street, London.*

Spade and Fork Husbandry.—Mr. Dixon has made some remarks, at p. 38, on the use and durability of Parkes's steel digging forks. I beg to observe that "Experience is a great teacher," both to those who make forks and to those who use them. After years of close application and months of severe drilling to our workmen, we now rarely, if ever, turn out a defective article, and when such a case does occur our agents in London are instructed to make good the damage to the purchaser in all such instances. "Occasionally, if carelessly used, a tine will break," says your correspondent. Now, after a little experience, the workman will become so enamoured of his light and handy tool, that he will not break it carelessly. In many instances where the workman has hard stony subsoil to dig, after delivering the load of a previous spit from his fork he will take a step backwards in the trench, at the same time raising his hands above his head he will bring down his fork with all the percussive force which he is capable of exerting, and should one of the prongs come in contact with a stone the concussion is so great that there is risk of its being broken. Now this is altogether unnecessary, as the points of the prongs of our steel forks are always so fine that the pressure of the foot is quite sufficient to

drive them down in any soil, and when it is so driven the workman can feel if it comes in contact with a large stone, and by moving the handle of the fork to and fro he will spring the prong and pass by the stone. By what I learn from the description which your correspondent gives of his land I think three-prong forks would answer his purpose better than four prongs. I know instances where two prongs are the most useful implements for digging clay-land. As a general rule a person should never use more prongs than he requires, for the greater the number of prongs the greater is the amount of pressure demanded to sink the fork to its depth, and the greater is the cost of the article. In some instances a three-prong fork will break a clod up the centre, allowing a part to fall on either side, where a fork one inch wider would bring up the clod whole, notwithstanding the prongs are so much further apart. Your correspondent says his men will dig from 5 to 6 rods per day; I presume about 30 square yards in the rod. This is by no means the maximum amount of labour which can be performed if the workman lays himself out judiciously for the work. Throughout a large tract of land lying between Birmingham and Lichfield, trench digging is now universally adopted, and we have many men in this immediate neighbourhood who frequently dig 5 roods per day (a local measure of 8 yards each way, viz. 64 square yards). We have, in fact, one man particularly clever at this kind of work, who has with the assistance of his own two boys, aged respectively 11 and 13 years, dug an acre 18 inches deep in 10 days. This is the system:—Suppose the land to be a foul stubble it is ploughed about 5 inches deep, and then the manure is carted on it; it is then ready for the diggers. The man gets out a trench from 20 inches to 2 feet wide. The first boy takes a four prong steel Potato or short-handled dung fork, one that has been considerably worn; with this implement he pulls the furrow slice of the plough to pieces, and places it in the bottom of the trench, taking care to keep it all down level, to prevent Couch from growing through; he then scatters the dung all over it. The man follows with his large steel trenching fork, say 9½ by 16 inches (two spits with this fork take up the width of the trench), and this soil is turned over (right or left, as the case may be) on to the manure. The second boy follows with a No. 1 shovel, and clears up the crumbs from the bottom of the trench, pointing the work with them. In clay land, perhaps, this last operation would be better omitted. *F. Parkes, Sutton Coldfield, near Birmingham.*

The Late Frost and Rain-fall in 1854 *in Hertfordshire.*—The following list of the minimum temperatures on the severest nights of the late frost may be interesting, by way of comparison. The minimum thermometer is 6 feet from the ground:—

	Min.		Min.
January 19...	13°	February 13	10°
„ 31...	18°	„ 15	15°
February 1	11°	„ 16	15°
„ 9	14°	„ 17	8°
„ 10	12°	„ 18	14°

From Feb. 7 to 22 the temperature never reached the freezing point. Vegetation, notwithstanding the long-continued severity, has escaped better than in the two preceding years, Laurels and Bays especially, a result mainly to be attributed to the previous dry season. I saw a plantation of young Laurels completely destroyed by the frost in Feb. 1853, which was not nearly so severe a month as the last (mean temp. 4° higher), but which set in after a wet mild December and January, and a very wet autumn in 1852. The ground in which they were planted was light and sandy, and well drained, and the situation rather elevated, so that no excessively low temperature could have been the cause. The frost in 1853-4 injured Bay and Laurustinus shrubs, which this year have been unscathed. I subjoin a table of the rain-fall at this place during 1854:—

	Inches.		Inches.
January	1.91	Brought forward ...	10·42
February	0.87	August	1.98
March	0.45	September...	0.83
April	0.81	October	2.37
May	3.36	November...	1.59
June	1.16	December	1.42
July	1.86		18.61
Carried forward ...	10.42	Rain, 1852	29.79

C. B. N. P., Stevenage, March 12.

Lapstone Kidney Potato.—I think I shall be doing service by recommending your readers to try this kidney; its quality is excellent, and it is an abundant cropper. I obtained this sort from Messrs. Sutton last year, and out of the produce, which was about 2 bushels, only one tuber was slightly affected with disease. *G. Rous, Laverton, near Bath, March* 13.

Water-wheels, Orchard-houses, and Garden Walls.—I have half an acre of water at the top of a hill, from which in wet weather issues a stream about the size of my wrist. This water I am conveying to a kitchen garden 42 feet below the pond, to supply a fountain in the middle of the garden, and also to give it (the garden) a shower two or three times a week. I want this water to turn a saw mill. What I wish to know is, the power and velocity given to the periphery of a water-wheel 6 feet in diameter, by water running out of a pipe 2 inches in diameter, with 42 feet of fall or pressure, into the usual shaped boxes on the circumference of a water-wheel. Can any of your correspondents give me their experience in this matter? I am constructing an orchard-house, the glass 21 ounces to the foot, the rafters 23 inches apart. I want to substitute something for lapping the glass, as I am thinking of grooving the glass into the rafters instead of puttying. Would lead do, as in lead lights? I have just constructed a garden wall of stone, on which I intend to stretch a wire trellis, like the invisible wire fence, to save defacing the walls, and to prevent the fruit being eaten up by woodlice, &c. I have cut off the capillary attraction of the wall by boiling gas-tar and lime together, and spreading it on the stone about 6 inches from the earth. This has answered the purpose, wears very well, the stone beneath the tar being dark and wet, all above being white and perfectly dry—the whole expense for a wall for half an acre of garden being only a few shillings. The composition must be laid on boiling, and afterwards more lime sprinkled over it to dry it. This would do for any wall, and the expense not to be compared with slate and cement. I am making some glass walls (20 oz.), which, when complete, will cost 4½*d.* per foot. I thus grow trees on each side, and the appearance is very good; this is intended for the south wall of my garden. I thus have no damp dark side. *S. N.*

Lombardy and Black Italian Poplars.—At p. 104 I perceive a question as to the utility of the last-named species (monilifera). In looking over an old book on gardening in 1818 I met with the following distich relative to the Poplar:—

> "Though heart of Oak be strong and stout,
> Yet keep me dry, I'll see him out."

I was at that time gardener to a gentleman whose alcove (which stood on the bank of the river Test) was undergoing repair; the floor, which rose 5 feet above the ground, was in a dilapidated state, and I advised him to renew it with boards prepared from the Lombardy Poplar. He did so, and I had thus an opportunity of testing its lasting properties. For 25 years it neither showed signs of dry rot nor the least symptoms of decay, and it is probable that it would have remained in the same condition for a period as long again had not the place been pulled down to make room for improvements. If the Black Italian Poplar be as lasting, its rapid growth, durability, and the facility with which it can be propagated would render it invaluable to large landed proprietors. I have a tree now growing in my garden, which when planted in 1841 measured 6 feet in height, its stem being rather larger than a man's thumb. The trunk of this tree now measures 38 inches in girth 6 feet from its base, and its height is upwards of 45 feet. Another peculiar feature in this tree is, its growing luxuriantly in low marshy bogs, where almost every other species of timber ceases to thrive. *C. T., Whitchurch, Hants, Feb.* 25.

Mr. John Weeks' and Co.'s One-boiler System of Heating.—As your reporter visited our nursery in December last and reported on our improved apparatus for heating the whole of our establishment with one boiler, and as since then the winter has been unusually long and severe, we think both you and the public will be interested in learning how the apparatus heating such extensive ranges of houses and pits by one boiler has succeeded. The conservatories, hothouses, and pits would extend in one line 1000 feet and expose to the atmosphere 16,000 superficial feet of glass. Many of the houses are wide and lofty, and are divided into about 40 different compartments, and several of the propagating houses and pits have both top and bottom-heat. Throughout the whole of the late severe weather the boiler and apparatus have worked to our entire satisfaction, giving us a greater command of heat than we required, and enabling us for the first time to dispense altogether with matting and every other description of external covering. In this we have found a large economy not alone in saving the cost of mats but also in avoiding the breakage of glass, which formerly was both expensive and seriously inconvenient. In our hothouses we have been able to maintain a temperature of from 70° to 80°, in the greenhouses 60°, and 90° for bottom-heat, air having been admitted both by day and night. Our nursery, though laid out with much regularity, yet consists of various detached buildings, so that large portions of the main pipes have to pass underground; but notwithstanding this great disadvantage, we feel confident that we could heat nearly if not quite double the quantity of glass with the same boiler. We use coke, the consumption of which has not averaged more than three sacks each 24 hours, and we feed the boiler every 12 or 14 hours. We are no longer inconvenienced by having to attend to a number of fires, stokeholes, and chimneys, and the boiler and apparatus being powerful there is always a large supply of hot water in circulation through every house, or division of a house; and by a simple but well contrived brass valve we are enabled in a few minutes to regulate the temperature throughout each building of the establishment according to our desire. Our Orchid-house is situated upwards of 300 feet from the boiler, and in it we maintain a regular steady temperature of from 70° to 80°. We are fortunate in having had so severe a winter to test the efficiency of our new arrangements, and doubly so in their having proved so eminently successful. *John Weeks & Co., King's Road, Chelsea.*

Societies.

Linnean, *March* 6.—The President in the chair. Mr. J. T. Syme exhibited specimens of a variety of Ophioglossum vulgatum found at Swanbister, Orkney, together with a series of specimens of the species from other localities; and also specimens of O. lusitanicum from various distinct localities; and made some observations on the two supposed species, which, in common with many recent botanical writers, he considered as merely varieties of one species. N. B. Ward, Esq., exhibited on the part of Mr. M. T. Masters a remarkable abnormal stem of a species of Dipsacus; and some observations on the specimens exhibited by Mr. Masters were read. The commencement of a memoir on the botany of Madeira and Teneriffe, by C. J. F. Bunbury, Esq., was read, and from it the following passages are gleaned:—The first thing that strikes a botanist on landing at the capital of Madeira is the thoroughly tropical aspect of the cultivated vegetation. The Banana, the Sugar-cane, the Coffee, the Guava, and the Custard-apple are seen in all the gardens. On the lower slopes of that sunny amphitheatre of mountains, which rises from the Bay of Funchal, most of the productions of the tropics are cultivated with success. The Papaw is frequent in the gardens, and ripens its fruit abundantly. Pandanus odoratissimus grows to a great size, and occasionally ripens fruit. The Rose-apple is a common garden tree, attaining to great size and beauty. In the fields and in the little plots and terraces of soil, which are cultivated with infinite industry amidst the basaltic rocks, we see the plants of the tropics mixed with those of the temperate zone—the Banana, Sugar-cane, Coffee, Orange, and Guava, in company with the Peach, Vine, Fig, and the tall Italian reed, Arundo Donax. Two of the characteristic field crops in Madeira are the Sweet Potato (Batatas edulis, Convolvulus Batatas?), and what is there called the Inhame or Yam, which is an aroideous plant (Caladium nymphæifolium?) with beautiful large leaves of a peculiarly soft and tender green. The culture of the Cactus or Opuntia (O. Tuna, according to Mr. Lowe), has of late been much extended. When, leaving the beautiful gardens of Funchal, search was made for the native vegetation, considerable disappointment was at first experienced, partly owing to the season; for winter has a much more decided effect on the condition of the vegetable world in that island than might have been inferred from its latitude. One striking characteristic of Madeira is the rapidity with which exotic plants become naturalised. This process is going on so fast that it is difficult, and is constantly becoming more difficult to judge what plants are really native and what are introduced. For example, a beautiful cherry-coloured Oxalis (O. speciosa?) from the Cape of Good Hope was introduced into the island by a lady still living there, and is now thoroughly established as a wild plant and very abundant in many places, not only in cultivated fields, but on rough, wild, broken ground amidst the Fir plantations. So also Pelargonium capitatum and Salvia pseudo-coccinea are completely naturalised in various places. The Datura arborea and Fuchsia coccinea are rapidly establishing themselves. It is very probable that many other plants, of which the exotic origin cannot so easily be traced, may in like manner have been introduced into Madeira in modern times, through the agency, either voluntary or accidental, of man. The culture of the Vine hardly extends above 2000 feet; beyond this there is still some cultivation, but it is in scattered patches, no longer so continuous and extensive as to exclude the native vegetation. Of Ferns, the Polystichum angulare and Blechnum boreale are very common in the Chestnut woods of the mountain sides. Asplenium anceps, Asplenium acutum, and Polypodium vulgare frequent on rocks in this as well as in the lower region. Nephrodium affine [Lastræa Filix-mas] and Polystichum falcinellum more local. This last is an interesting plant remarkable for its very rigid texture, and its resemblance at first sight to the leaves of a Zamia. Mr. Bunbury found it sparingly in the woods about the Jardim da Serra, the residence of Mr. Veitch, 2000 feet above the sea, and in a more dwarfed state amidst the crowning rocks of the Arrebentao peak, at an elevation of more than 3800 feet. The beautiful ravine, commonly called the Little Carral, from which the Ribeiro de Joao Gomez descends to Funchal, is attractive to a botanist, and especially to a lover of ferns. Here Woodwardia radicans, Adiantum reniforme, Pteris arguta, Cystopteris fragilis, Athyrium Filix femina, Lastræa elongata, Davallia canariensis, may all be found, with abundance of Lycopodium denticulatum. The fine ravine of the Santa Luzia torrent, at the head of which is a remarkable waterfall, is still more rich in Ferns. Woodwardia radicans, Allantodia [Asplenium] umbrosa, and Pteris arguta grow in most luxuriant beauty about the foot of the waterfall, at an elevation of 2600 feet above the sea. Adiantum reniforme is plentiful on the cliffs that bound the ravine; and A. capillus-veneris, which at Funchal grows close to the actual sea shore, extends even up to the waterfall. In this one ravine, and in one day's excursion, 22 species of Ferns were observed. The Tea tree is cultivated with great success by Mr. Veitch at the Jardim da Serra, and its produce is of excellent flavour. At Funchal it does not succeed. On the highest parts of the southern mountains occur a few Ferns, particularly Gymnogramma Lowei [G. totta], and Blechnum boreale; these two ascend to upwards of 3800 feet. Madeira is famous for its abundance of Ferns, owing to its wild and wooded condition, and its very moist climate. The beautiful Haresfoot Fern (Davallia canariensis), and the Polypodium vulgare, appeared the most generally common throughout the island. The other Ferns enumerated by Mr. Bunbury, with notices of their localities, were the following:—Nothochlæna lanuginosa, Gymnogramma Lowei, G. leptophylla, Acrostichum squamosum, Blechnum boreale, Woodwardia radicans, Pteris aquilina, P. arguta, Cheilanthes fragrans, Adiantum reniforme, A. capillus-veneris, Asplenium palmatum, A. anceps, A. monanthemum, A. marinum, A. canariense, A. lanceolatum, A. acutum, Athyrium Filix-femina, Allantodia umbrosa, Scolopendrium vulgare, Ceterach officinarum, Polystichum falcinellum, P. aculeatum [angulare], Nephrodium molle, N. affine, N. elongatum, N. fœnisecium [the three latter Lastræas], Cystopteris fragilis, Davallia canariensis, Trichomanes speciosum, Hymenophyllum tunbridgense. The Fern Flora of Madeira, according to Mr. Lowe, comprises 40 species, of which the relative distribution in Madeira and the adjacent isles is traced. The author then, at considerable length, records his observations on the lower cryptogamic and the phænogamous plants of the island.

Pomological, *March* 5.—Dr. Davies, of Pershore, in the chair. The chairman furnished a collection of Apples from the orchards of Worcestershire, among which the most remarkable were the Flanders Pippin

and the Queen's Delight, two sorts which are not in general cultivation. The former is a very large variety adapted for kitchen use, and keeps in good condition till April. It possesses a tender flesh, with a delicate and pleasant acidity, and has an agreeable perfume. The latter is a small dessert Apple of very excellent quality, the trees of which are in the last stage of decay; but Dr. Davies intimated that he would furnish the Society with grafts to be distributed among its members. The same gentleman also placed grafts of three varieties of seedling Plums, which he stated to possess superior merits, at the disposal of the Society. The Secretary reported upon specimens of the Melon Apple which were exhibited by Mr. Rivers at a former meeting. This variety has a very high reputation in America, and Mr. Rivers has succeeded in fruiting it in this country. The specimens so produced were found to be of large size and handsome; the flesh tender, crisp, juicy, and vinous, with all the delicacy and perfume of the imported fruit of the Newtown Pippin. From Mr. Smith, of Herefordshire, came a large assortment of Apples from the orchards of that county; and from G. S. Wintle, Esq., was a collection illustrative of the pomology of Gloucestershire. Among them we observed the Carraway Russet in good condition, and a seedling dessert variety raised by Mr. Holbert, of Gloucester. Mr. Lane, of Berkhamstead, exhibited fruits of the New Hawthornden, which were perfectly sound even at this late season, and possessed all the merits of its parent. There were also other specimens of Apples and Pears from the same nurseryman. Mr. Bunyard, of Maidstone, contributed examples of Pears grown in that neighbourhood. Seven new members were elected.

Notices of Books.

Elements of Geometry and Mensuration, with easy Exercises, designed for Schools and Adult Classes. Part II.: Geometry as an Art. By Thomas Lund, B.D. Longmans, 12mo., 2s.

The favourable opinion expressed by us of the first part of this little work deserves to be extended to the second. Mr. Lund has endeavoured to bring practical geometry to the notice of those whose attention is usually confined to Euclid, and to add the scientific principles of geometry to the knowledge of persons who are usually only taught how to apply rules deduced from and depending on them. In this the author appears to us to have been eminently successful. His work will be found especially useful to young men who, feeling a want of knowledge on these subjects, have to supply that want by their own exertions.

Mensuration made easy, or the Decimal System for the Million: with its Application to the daily employments of the Artizan and Mechanic. By Charles Hoare. 3d thousand. Effingham Wilson. 12mo, 1s.; or in cloth, 1s. 6d.

This is a book of rules without the reasons for them, and therefore not one calculated to improve the minds of those for whom it is intended. At the same time, as a book of rules, the work will suit those who, so long as they can do a thing, care little to know the principles upon which they proceed.

Garden Memoranda.

Messrs. Chandler's Nursery, Vauxhall.—The extensive collection of Camellias, for which this nursery has been long and justly celebrated, is now in full bloom, and well worth inspection. Red kinds, as altheæflora, Chandleri, Woodsi, imbricata, elegans, &c., are abundant and fine, and the old Double Whites have flowered well here this year, few of the buds having dropped. Of Carnation-striped varieties Albertus is still one of the best, the next being perhaps Colvilli striata, and the semi-double sort called tricolor is also very pretty. Among newer kinds may be mentioned Marchioness of Exeter, a fine rose, not very double, but never showing the eye; Reine des Fleurs, a beautiful imbricated red; Duchess of Northumberland, white, flaked with pink, and very handsome; americana, a small, delicate pink, with a good round petal; elata, a small but compact carmine; Teutonia, a medium-sized rose, and very constant; and Henri Favre, a small but finely shaped red kind. We may add that, in addition to the treat the Camellias afford, the show-house is at present gay with Hyacinths, Narcissi, purple-striped and other Crocuses, Azaleas, Epacrises, Cinerarias, Cyclamens, and forced shrubs, among which we remarked the pretty white-blossomed slender Deutzia (D. gracilis). This, we need scarcely say, is a most valuable plant for forcing, requiring about the same treatment as Kalmia glauca, and things of that sort. Here and elsewhere out-door plants have suffered considerably from the severity of the winter, but the exact extent of the injury committed is at present unknown.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—No time should be lost in ascertaining whether or not there is a sufficient quantity of suitable plants for the decoration of the conservatory during the summer and autumn. If this is attended to at once very much may yet be done towards making up for any deficiencies which may be discovered, for it is not yet too late to provide multitudes of showy plants for autumn decoration. Young plants of Allamandas, if encouraged with bottom-heat, &c., and stopped occasionally will form nice little bushes in course of the summer, and cuttings of Clerodendrons may be rooted, and made to form nice little flowering plants in a few months, and Torenias, Vincas, and many other soft-wooded stove plants, if kindly treated, soon form useful-sized specimens.

FORCING DEPARTMENT.

Pineries.—Attend carefully to the bottom heat, particularly where this is produced by fermenting materials, as tan, &c., and see that it is not allowed to rise too high, which it is exceedingly apt to do after fresh materials have been added, either during bright weather, or where there are pipes under the bed, where much fire heat is used. It requires some practice and attention to be able to keep the soil in a proper state as regards moisture, but this must be effected at any expense of attention if success is to be insured. Maintain a thoroughly moist atmosphere, but do not push young stock too fast until we may be favoured with more sunshine, when if all is right at the roots there will be no danger of drawing the plants, as would be the case in the present cloudy state of the weather. Avoid allowing water to lodge in the hearts of plants showing fruit, and spare the flowers of those in bloom with the syringe. Pot off or plant out suckers as they can be obtained sufficiently strong, and attend to keeping up a regular succession of plants, which is the surest way of providing for a succession of fruit. Vineries.—See that the houses in which the Vines are not yet started are properly cleaned, the Vines painted with the usual composition of soft soap, sulphur, &c., and everything put into proper working order; also get the rods bent in time to induce the buds to push regularly. Attend to disbudding and stopping, &c., as may be necessary in the succession houses, and see that the inside borders are kept properly moist, giving tepid manure water as may be necessary to effect this, and do not be afraid of giving too much of this to Vines in pots. Be as sparing of fuel as the state of the weather will admit, and husband the sun's influences by shutting up early on the afternoons of bright days; for depend upon it there is no heat so congenial to vegetation as that derived from the sun. Where plants are grown under Vines keep a sharp eye upon these for thrips and spare no pains to keep them clear of this pest, which if once allowed to get upon the Vines will spread with amazing rapidity and soon ruin the foliage. This is not only the most destructive insect with which we have to contend, but it is also the most difficult to extirpate, and should, therefore, be kept under by every possible means. Frost is the only effectual means of eradicating it, but tobacco smoke and a liberal use of the engine will keep it in check and prevent its being injurious. Azaleas are exceedingly subject to it, and many of the varieties can hardly be kept clear of this pest while growing in heat, and if these must be grown in Vineries they must be carefully watched and smoked, or syringed with the mixture recommended in a previous calendar for the destruction of this pest immediately it is perceived, for if it is ever allowed to get established upon the Vines the chances are that it will greatly injure the foliage before it can be eradicated.

FLOWER GARDEN AND SHRUBBERIES.

Sweep and thoroughly clean lawns, and roll them with a heavy roller as often as may be necessary, to render the turf even and firm. This is sometimes, through the pressure of other jobs, put off until dry weather sets in, after which the roller makes comparatively little impression; whereas, if done at once, while the turf is in a soft spongy state, it will be greatly consolidated and improved for the season. If any alterations or planting still remain to be done, every available hand should be concentrated on this work, so as to get it completed as quickly as possible. Planting, unless done soon, will be almost sure to require much attention in watering, and this during the very busiest season of the year, especially in the case of large shrubs or trees, and it is much too common a practice to put off such work until too late in the season. Look over the beds planted with bulbs, and where necessary stir the surface soil, so as to keep it open and friable, and also to give it a fresh, neat appearance. If the stock of bedding plants is still deficient get in cuttings in the most favourable position, and with the least possible loss of time. See to the propagation of Dahlias and Hollyhocks; the latter are now, thanks to the well directed labours of the florists, so greatly improved, that they much surpass the Dahlia for many situations, and ought to be extensively planted in every garden.

HARDY FRUIT AND KITCHEN GARDEN.

Now that we are being favoured with comparatively mild weather, Cauliflowers and Lettuces that have been wintered under glass may be planted out, selecting a sheltered deep rich piece of ground. It is a very good practice in planting-out things that are at all tender at this uncertain season to throw up the ground in good strong ridges running east and west, planting on the south side of the ridge. The plants are thus sheltered from the north winds and fully exposed to the sun. Peas, &c., that have been raised under glass, if properly inured to the weather, should be planted out at once, giving them the most favourable situation at command, and it is a very good practice to shelter them for some time after planting out, by placing some branches of Spruce Fir, or any other suitable evergreen along the lines so as to break the wind, &c. Take advantage of dry days to stir the surface of the ground among growing crops, and to prevent weeds from making their appearance.

Notices to Correspondents.

Diseases: *W M.* Had your plants been exposed, we should have said that they were frost-bitten, for it is frequently the case only of evergreen leaves that are affected. But your account is not consistent with such a notion. Neither is the fault, as it appears, in the soil. Many similar affections arise from some deficiency of ventilation, or from the miasma of noxious matter for which there is no sufficient outlet. Are you sure that there is no latent evil of this sort. The vital powers of your plants are evidently too low, and perhaps the judicious application of some stimulant might remedy the mischief, provided the ventilation be perfect. *M. J. B.*

Footmarks in Snow: *R.* Prof. Owen has distinctly shown that the mysterious tracks seen in Devonshire are merely those of the plantigrade hind-foot of a badger; having the five short claws in front, and the rounded heel behind, which latter has been mistaken for a hoof! and the tracks consequently have, in most instances, been traced backwards, which bothers the observer. The badger climbs well, both walls and sheds: he is a harmless nocturnal beast, very active, and having a great range of prowl when roused by unusually long frost out of his winter repose. You may have badgers in your vicinity a long time before you are aware of them, until their nocturnal rambles are made manifest on snow. The long and large hind-foot, in walking, usually obliterates the impression of the corresponding fore-foot, and so leaves a track as of some mysterious hoofed biped. Its tail is too short to make a track, as an otter's would. A question of this nature hardly comes within the subjects of this journal; but we answer your question for the sake of showing you that there is no necessity to have recourse to the unknown in explaining appearances which scientific observers like our eminent comparative anatomist have no difficulty in referring to simple natural causes.

Gorgonias: *W. Smithson.* These are corticiferous Polypes, therefore animals, not plants, and we have nothing to do with them.

Grass Seeds: *J M Caledonia.* It is very difficult to say. We advise you to state your case to Messrs. Lawson and Co. of Edinburgh, and to take their advice. You cannot have better. Transplant your evergreens in September, not in April or any other time in the spring.

Late Correspondents: *R S G.* We are sorry to disappoint you, but it is out of our power to answer inquiries which do not reach us till we are about to go to press.

Monstrosities: *J J M.* Very much obliged; but such cases are by no means uncommon. You will find a similar malformation figured at p. 669 of our volume for 1848. We do not know who wrote the treatise you speak of.

Mulberry: *E B S.* The fruit of the Mulberry is the ripened state of an inflorescence; that of the Strawberry and Raspberry is the ripened pistil of a single flower. The other part of your question is unintelligible. What are fructures?

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*W S.* Helleborus niger, changing its colour.—*Constant Reader.* Oncidium maculatum.—*A D.* C. [illegible]gyne ocellata and C. micrantha.—*Z X.* Oncidium sanguineum; very pretty.—*J B K L.* Your Col is Enteromorpha compressa; but the question is not horticultural, nor does it relate to Rural Œconomy.

Pentstemon: *A H.* P. Cobæa is figured in the "Botanical Magazine," t. 3465. We do not know what Calceolaria violaris is. C. violacea is a greenhouse under-shrub, which will of course live out of doors in summer. Plants from Chilöe are not hardy unless they are annuals.

Rhododendrons: *J H R.* Graft them now and place them in a close frame, and if on a gentle bottom-heat so much the better.

Rubus Arcticus: *A H.* This will fruit, indifferently, in a peat bed; as to R. Chamæmorus we never saw it fruit in this part of the kingdom. If plants can be had it will probably be in Edinburgh.

Stunted Trees: *W H H.* The period for ringing the branches of these, in the way described by Mr. Billington at p. 152, is, we presume, when the bark will run. ‡

Susquehanna root: *J B D.* You are quite right: the whole affair is an ingenious and successful scheme to sell what we can only hope does no harm.

Transplanting Roses: *C B N P.* The best month in the spring for moving them is the present; but the best time of all for the operation is as soon as the leaves have fallen in autumn. ‡

White-fruited Blackberry: *A H.* We have seen this variety of Rubus fruticosus; and it may still exist in some remote place. It is a mere curiosity, and has nothing to do with Needham's white, which is an American not European species.

Misc: *A B C.* Fritillary roots require no particular attention beyond planting them out in the open border in good light garden mould. Any nurseryman can supply them. The best cure for mildew on Roses is dusting the parts affected with sulphur the moment the evil is perceived. ‡—*Northwood.* In a soil like yours Beans will be the best crop to put between your rows of Potatoes, which you anticipate may fail. Let the rows of Potatoes be not less than 2½ feet apart, and the sets 10 inches asunder in the row. Pond mud mixed with lime makes a good top-dressing for a lawn; but it should have been put on in autumn. If applied now no time must be lost and it should be well rolled in afterwards. ‡

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

TO FARMERS AND OTHERS.

REFUSE ANIMAL MATTER FOR SALE.—Contains large quantities of nitrogen, sulphuric acid, fat, &c. It will make a first-rate MANURE; price 6*l.* per ton. A sample forwarded free by enclosing 12 postage stamps.—Apply to Mr. CROOK, Chemist, Mill Pond Street, Bermondsey, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 5*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK LOTHERGILL & CO., 204A, Upper Thames Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
OFFICES, 37, CHARING CROSS, LONDON.
Directors.
The Hon. J. W. Fortescue. | General Macdonald, C.B.
G. P. Irvine, Esq. | Newton S. Scott, Esq.
Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Solicitors—Messrs. Vallance & Vallance, 20, Essex Street, Strand.
Agricultural Chemist—William White, Esq.
Secretary—Mr. W. F. Mould.
The Directors invite the attention of landed proprietors, agriculturists, &c., to the Patent Cyanic Manure, as containing the most approved elements of fertilisation in their just proportions; it can be, therefore, confidently recommended as a very superior dressing for Wheat, Barley, Oats, Clover, Grass, &c. Price 8*l.* per ton.
Prospectuses (with practical directions for use) may be had on application, or will be forwarded by post.
All orders, applications for Agencies, &c., to be addressed to the Secretary, at the offices of the Company, 37, Charing Cross.

THE MANCHESTER SEWAGE GUANO COMPANY respectfully inform Agriculturists that they have made arrangements which will enable them to meet the increasing demand for their Manures. The MANCHESTER SEWAGE GUANO is a compost of Blood, Bones, Urine, Nightsoil, and other Animal Matters, and highly fertilising Chemical Ingredients, which are in a concentrated state incorporated with Animal and Vegetable Charcoal, ground to a fine powder, *the whole forming a dry portable Manure.* It is free from all kinds of Seeds, Weeds, &c., and enriches the land to a considerable degree for several years after it is used. Price 5*l.* 5*s.* per ton. Net cash on delivery. Testimonials forwarded on application. Carriage free to any Railway or Canal Wharf in Manchester.—JOHN THOMPSON, Secretary, 3, Watling Street, Shudehill, Manchester.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.
Trustees.
Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.
Directors.
Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.
Edward Bell, Esq., Tottenham, Middlesex. | Robert Leeds, Esq., West Lexham, Norfolk.
John Clayden, Esq., Littlebury, Essex. | Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Richard Hunt, Esq., Stanstead Abbot, Herts. | Thomas Nash, Esq., Great Chesterford, Essex.
Thomas Knight, Esq., Edmonton, Middlesex. | James Odams, Esq., Bishop Stortford, Herts.
John Collins, Esq., Middleton Square, Pentonville.
With power to add to their number.
Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.
MANUFACTORY, PLAISTOW MARSHES, ESSEX.
The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.
They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have proceeded to make one possessing similar qualities. As security, therefore, to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7*l.* 10*s.* per ton.
Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, or sown broadcast; if the latter, it should be well harrowed in.
Turnip Manure, 6*l.* 10*s.* per ton.
Delivered at any Railway Station or Wharf in London.
Applications to be made to ODAMS, PICKFORD, & KEEN, Agents for the above, 35, Leadenhall Street, London.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Great improvement may be effected by sowing 8 to 12 lbs. per acre of SUTTON'S Renovating Seeds, which consist of Perennial Clovers and Grasses of the finer kinds for improving the bottom.
An increase of several Tons of Hay per acre has been thus effected on many Meadows and Upland Pastures. The Seeds should be sown early.
The drought of last summer having caused partial failures in the ordinary Grass and Clover Leys, SUTTON'S Renovating Grass Seeds may be sown with great advantage *in all such cases.* PRICE REDUCED TO **9d.** PER POUND.
SUTTON & SONS *also supply Grass Seeds for laying down Land to Permanent Pasture at a moderate expense, the sorts being selected in accordance with the nature of the soil to be laid down, particulars of which may be obtained by post.*
Goods delivered Carriage Free by Rail.
Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the SEEDSMEN to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.
Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").
CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.
RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.
CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.
PARSNIPS.—Gibbs' large Guernsey Cattle, common large.
MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.
CABBAGES.—Large Drumhead Cattle, Thousand headed.
TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.
Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.
KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.
Priced Lists of both Agricultural and Garden Seeds sent free by post on application to THOMAS GIBBS & CO., Corner of Half-Moon Street, Piccadilly, London.

RENDLE'S AGRICULTURAL PRICE CURRENT AND FARM DIRECTORY FOR 1855, *with Newspaper Stamp to go free by post, is now published, and can be had in exchange for six penny stamps.*
The proprietors of this well-known and widely circulated publication have much pleasure in announcing another edition for the present year. They have spared no expense nor trouble in making it a most useful and serviceable guide to all who take an interest in the cultivation of the soil. It contains a valuable Descriptive List of all the best AGRICULTURAL SEEDS, with prices affixed to every article, with cultural remarks and general information as to the best varieties for various crops.
The List of TURNIP SEEDS is very comprehensive, and is embellished with an ENGRAVING of RENDLE'S IMPROVED SWEDE TURNIP—a variety in great favour in the West of England.
The descriptive Lists and Tables of the best selected GRASSES are very complete, and will be found eminently useful to all who intend laying down land for Permanent Pasture, Ornamental Parks, Pleasure Grounds, &c.
There is a very useful ALMANACK, which has been compiled with much care.
In the MANURE DEPARTMENT there is a general Price Current of all the leading Manures, including Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, &c.
The ORIGIN AND HISTORY OF PERUVIAN GUANO will be found amongst its contents, as well as some excellent advice for detecting the spurious from the genuine article. The proprietors have been favoured with some good sound advice to Farmers on this point by J. C. NESBIT, Esq., the celebrated Agricultural Chemist. They have also reprinted PROFESSOR WAY'S LECTURE on the same subject, from the *Gardeners' Chronicle*, read to the Members of the Royal Agricultural Society.
Descriptive articles relating to Lawes' Patent Superphosphate, Nitrate of Soda, the new Mexican Guano, and other manures will also be found very useful and interesting.
The "SUPERPHOSPHATE CONTROVERSY" in the Plymouth Papers is also given at length. The whole of the letters are reprinted from the *Plymouth Herald.* In this Controversy the "*Gypsum mixers*" are fully exposed by Mr. J. PRIDEAUX, the eminent Agricultural Chemist.
A valuable Paper has also been written expressly for this Edition by Mr. R. ERRINGTON on the "*Cultivation of the Potato,*" as well as an article on "*Liquid Manure*" by the same gentleman.
The Proprietors have also much pleasure in stating that they have been favoured with two Original Articles, by J. B. LAWES, Esq., Rothamsted, the celebrated Agricultural Chemist, on "*The Artificial Manures most suitable for the Growth of Barley*" and "*The Cultivation of one Grain Crop after another on heavy land.*"
There will be a good Engraving of the CEDRUS DEODARA, one of the hardiest and best varieties of Cedars ever introduced, and prices of various Forest Trees, Shrubs, and Fruit Trees.
Engravings and descriptions of a great many Agricultural Implements are also added in the present Edition, and amongst them will be found M'CORMICK'S AMERICAN REAPER, GARDNER'S TURNIP CUTTER, SAMUELSON'S REGISTERED LAWN MOWER, PATENT LIQUID MANURE DISTRIBUTOR, WARNER'S GARDEN ENGINES, PUMPS, SYRINGES, &c.; FOWLER AND FRY'S CHAFF CUTTING MACHINE AND ONE ROW TURNIP DRILL, ANTHONY'S PATENT AMERICAN CHURN, AND PARKES' STEEL DIGGING FORKS.
Descriptions are also given of the New CHINESE POTATO Dioscorea Batatas) and the FLUKE KIDNEY POTATO, a sort highly recommended in the Midland Counties.
At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It contains 28 folio pages, "Chronicle" size.
Copies can be procured, price 6*d.* each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the
LONDON PUBLISHING OFFICE, 294, STRAND;
Or from the Proprietors, WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

TO WHEAT GROWERS.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, have received from North-West America a small quantity of two new kinds of WHEAT, which they are sending out in packets containing 200 grains. One kind is named Club-headed, cultivated by the old Californians. The yield is said to be very large, and forms a very beautiful delicate-coloured sample. Price 20*s.* per packet, containing 200 seeds.
The other kind is evidently a variety of Triticum durum, with solid stalks. It is very early, and well adapted for spring sowing. Price 15*s.* per packet, containing 200 seeds.—Orders may be sent to PETER LAWSON & SON, in Edinburgh; or direct to their London House, 27, Great George Street, Westminster.

FARM SEEDS.

W. DRUMMOND AND SONS have implicit confidence in recommending the following Seeds:—
PERENNIAL RYE-GRASS, from the most select growths, and perfectly clean.
ITALIAN RYE-GRASS, direct from Lombardy, and through the same gentleman in that country who has for several years been employed by us in collecting those fine parcels which have hitherto given so much satisfaction to our customers.
GRASSES FOR PERMANENT PASTURE.—*Having been among the first to recommend the use of the* NATURAL GRASSES *in the formation of* PERMANENT PASTURE, *the subject has occupied a large share of our attention. We have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of our observations, as well as from the great satisfaction our selections have given, we feel warranted in recommending, in addition to the Grasses usually sown, a variety of such species as are known, not only to yield the greatest bulk of herbage, but the largest amount of milking and feeding properties, varying those species, and the proportions of each, according to the nature of the land to be laid down.* From the increased demand, we are enabled to charge a lower price than formerly. An excellent assortment, and allowing a *liberal supply* of Seeds, may be had at from 24*s.* to 26*s.* per statute acre.
TURNIP, in all the leading varieties, saved by ourselves from full-formed Bulbs.
VETCHES (or TARES), large broad-leaved, a very superior sort.
Priced Lists of the above, with every other description of Farm Seeds, may be had post free on application.
FREE DELIVERY.—All Parcels of Seeds above 2*l.* value (with the exception of Grain and Vetches), delivered free in London, Liverpool, Hull, Newcastle, Belfast, Londonderry, Aberdeen, Inverness, and to all the Stations along the Lines of the Caledonian and North British Railways, &c.
W. DRUMMOND & SONS, Seed and Implement Warehouse, Stirling, N.B.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq. | William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S. | Sir S. M. Peto, Bart.
Henry Currie, Esq. | William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq. | William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.
Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE CONSULTING CHEMIST OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND (Mr. WAY) is about to REMOVE his LABORATORY from 23, Holles Street, to 15, Welbeck Street, Cavendish Square, where, after the 25th of March, all communications and substances for analysis should be addressed. Mr. WAY receives pupils into his laboratory for the study of Agricultural Chemistry.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—Prize Sheets for the CARLISLE MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

The Agricultural Gazette.

SATURDAY, MARCH 17, 1855.

THE discussion on ITALIAN RYE-GRASS CULTIVATION before the London Farmers' Club last week terminated in the adoption of a resolution which, however true in itself, was not, we agree with a writer in the *Mark Lane Express*, borne out by the evidence which was on that occasion laid before the meeting.

It may very properly be the opinion of that Club that "on most farms a portion of land sown with Italian Rye-grass, especially if irrigated in the manner of the Ayrshire farms, would in many ways be very advantageous to

the farmer, from the great amount of the produce and the easy and cheap mode of obtaining it;" but certainly, however satisfactorily the abundance and facility of the produce which may in this way be ensured was proved, no evidence was adduced in reference to its cheapness. We nevertheless believe in that as much as in the other; and if the weak point in the opening address be, as the *Mark Lane Express* asserts, its non-production of evidence on that point, this is, we believe, a weakness merely in the advocacy, not in the cause advocated. It was, we think, however, a sound discretion which led the discussion exclusively to the consideration of the productiveness of the crop. If that be proved, it becomes well worth the while of any one to inquire into the means by which it can be ensured. And though Mr. Telfer's experience, or that of Messrs. Kennedy and Ralston had been given in full detail, no one would have risked a large expenditure with the view of treading in their steps without inquiring for himself into the accuracy of the statement made, and the possibility, under altered times, &c., of verifying it elsewhere.

The speakers who followed Mr. Morton, in discussing the merits of the Italian Rye-grass, referred especially to the exhausting character of the crop and its watery character as food. On both points we believe that much misconception prevails. Mr. Denton, who referred to the unsatisfactory character of a glass full of froth to a thirsty man, seemed to think he had established a parallel case in placing Italian Rye-grass before a hungry animal, because it contained so much as 75 per cent. of water: but 75 per cent. of water is a remarkably small proportion in green food, as the analyses of Turnips, Mangold Wurzel, Clover, &c., prove; and it is needless to quote such illustrations, seeing that Mr. Mechi fairly closed discussion on that point by recalling to the recollection that there are 75 per cent. of water in a beefsteak! The succulence of Italian Rye-grass entirely depends upon its age. At the period when it is fit for hay-making it is not less substantial than other Grasses, and it excels them all in the palatable character which it retains up to a later stage of growth than is done by any other plant.

The exhausting character which it possesses is another feature in its character charged against it: and justly so. But this is a feature which belongs to it not as Italian Rye-grass, but as a productive crop. The distinction between scourging and ameliorating crops no longer exists, according to Mr. Nisbet, for it is possible to grow any crop on any land by the application of fitting manures; nevertheless, it is we believe the case, that after a heavy cutting of Italian Rye-grass the succeeding Wheat crop will be less luxuriant than it will be after Clover. The heavier growth of the former crop has not been obtained without expense to the soil—it would be very extraordinary if it had. Suppose that of two kinds of Turnip one is capable of a more thorough use of the fertility of the land than another, its greater consequent produce must more perfectly exhaust the soil, and the succeeding crop will suffer for it; but it is the better Turnip of the two for all that. Exhausting crops, in fact, are what we want. It is the very art of the farmer to convert the fertilising matter of his soil into marketable matters, such as milk, or grain, or meat; the more perfectly any agency does this the better will it serve his purpose. It must depend upon himself to fill the land with the raw material of his crops, and it depends upon the due selection of these crops to extract it all in the more profitable forms in which, as vegetable or animal substance, it exists. The Italian Rye-grass is one of the most thoroughly exhausting—one of the most voracious plants we can grow; and in that its very merit lies. If consumed upon the land, of course it so far reproduces the material out of which it grew; if carried off the land, of course it exhausts the farm as well as the mere field from which it has been taken. In either case it cannot be made to yield the enormous crops which Mr. Telfer and others obtain, except by doses of manure which are quite as remarkable in the history of agriculture as is the extraordinary produce in which they result.

Among the speakers who referred to the value of the crop were Mr. Baker, of Writtle, who related an experience of it of some fifteen years' standing; Mr. Sidney, who referred to its position in Italy under the irrigation system, both by sewage and by rain water, around Milan, where seven cuttings, four in winter for consumption green, and three for hay in summer, are obtained; Mr. Moore, who referred at length to Mr. Dickenson's experience at Willesden; Mr. Bradshaw, who spoke with favour of its use with Clover in ordinary rotation in a course of cropping; Mr. Williams, who confirmed what had been said on the liability to damage from the choice of inferior seed; and Mr. Mechi, who adduced his own experience, now generally known. The resolution we have already adverted to; it will, we believe, result in a larger extension of the crop than ever hitherto, and in an extended use of the irrigation system adopted at Tiptree and elsewhere.

[We add to the above that the related subject of Town Sewage is again to be discussed before the Society of Arts next Monday evening; and that when it is closed we shall draw attention to the results determined by it.]

According to official tables collected by M. Mounier in his work on the Agriculture of France the number of mules in the south-east division was in 1846 216,394, being in round numbers somewhat less than one-third below the amount of horses; and in the north-west the number of mules was 106,128, the horses being more than three times as numerous.

We know so little comparatively of Mule breeding in this country that we are tempted to give the substance of a letter addressed by the late M. Bujault to the directors of the Haras of Saint Maixent, in which he bitterly complains of the new government system of improving the breed of horses, because it directly led to the extinction of the old description of mare that used to produce the most valuable mules in France.

The district in question is that surrounding Poitiers, where about twelve millions of francs were annually realised by the export of these animals to Spain, Italy, and various parts of the central and southern parts of France.

Our author is an enthusiastic admirer of the mule, which he distinguishes as "admirable" and "superb," indispensable in the south of Europe, while the horse is only "handsome;" even the Arabian steed that bears the robber of the desert on its back and does not *work* is, in Bujault's estimation, "a hundred-thousand times" less valuable than the old Poitevin horses of ancient and honoured race, created for the soil and improved by extreme attention, from which had sprung the noble mule of Poitou. The author makes some preliminary remarks as to the influence of climate, soil, and pasturage on animals, and illustrates his argument by what we must accept as a fact—that on a large area of the locality around him several young horses go blind, and he attributes this to the water which they drink. The sour herbage of the Bocage, though suitable to the temperate, hardy and enduring mule, he asserts to be quite unsuited to the sort of cavalry horses which the Government introduced into that locality. While he does not affect to deny the possibility of improving the native breed of horses, as the Germans and English have done, he hints that the improvers must first possess such means and advantages as German and English landowners have at their command. Some of ours are thus flatteringly described:—"The English nobility, who possess a great proportion of the soil, have a mania for horses. I have before me an immense list, containing the names of English and Irish lords, who have from 150 to 1300 horses in their stables [!!] This is astounding. They will give 100,000 francs for a horse, and freight a vessel to Arabia for sires and mares." Maniacs and millionnaires he indeed finally designates them, but yet all powerful in effecting their object. His argument against the usefulness of the Haras in Poitou is in effect this—the mare of the old and true type for producing first-rate mules has certain points of conformation, viz., short body, long ribs, wide haunches, wide and low hocks, fleshy thighs, wide hoofs, heels well turned out and hairy; in short, a thickset animal of capacious body is the right mould for a fine mule. Now the directors of the Government studs would certainly not approve of such a piece of frame-work for moulding colts and fillies, though, according to the Poitevin farmers, it is for mule bearing the perfection of symmetry. M. Bujault rather dogmatically asserts that large mares with long legs, or lengthy and slight body and elevated back are generally barren. He affirms that of mares which have been served by the ass only two out of three become pregnant, and of these several cast the fœtus from the second to the seventh month, which he attributes to internal incapacity for mule bearing. Five out of six mares served by the horse will produce foals; it would naturally be inferred thence, that horse breeding would be more remunerative, but, on the contrary, we are here informed that the male progeny of the horse and mare (when emasculated) is of so little worth in that hot and relaxing climate, that the owner of a brood mare would rather that she missed foal than have a colt produced: the high price obtainable for one of the rare Poitevin high-caste mules renders the breeding of them—though mares be not prolific of them — more remunerative. Our author informs us that the males of the mule kind, also, in warm climates, though larger and handsomer than the females, are easily enervated, less capable of hard labour, and subject to a peculiar and wasting urinary disease, so that they are 25 per cent less in value. Annual importations into Poitou of some hundreds of mule-breeding mares from Bas Poitou and Britanny, first tended to the deterioration of the genuine breed of mules, and the social revolution which turned the heads of even the slow-going people of western France, stimulated the farmers there to rear horses (through the intervention of the Haras) that could go at a fast pace with diligences, &c. Thus the celebrated Poitevin mule was superseded by the light-bodied and fast stepping horse brought into existence for the sake of its speed. The strong, heavy, and somewhat peculiarly formed mare which used to be valued for rearing mules is out of fashion, and our author mourns thus:—"Inspectors and directors of Haras are sent to us—what their powers and privileges may be, I know not—they are, however, reformers, and arbiters of our horseflesh; they made us take our stallions from station to station, and have ruined choice stock for mule breeding. Nothing will satisfy them but huge brutes with long necks, long bodies, and long legs—racers! These are distinguished by privileges; every mare that brings into the world such an animal as I have described is honoured, and receives *la paie*, and is allowed to compete for the Government prizes if she have borne offspring to one of the herring-gutted* horses of the Haras." It might have been expected that the old gentleman who has so enthusiastically traced all the physical conditions of the mare—the usual maternal parent of the mule (the she-ass and horse engendering a very diminutive and inferior sort)—would have honoured the paternal donkey with some notice. But we have no information from him as to the Poitevin Jackasses of high degree, and are left to conjecture whether any of them equal those of Kentucky, which occasionally stand 15, and even 16 hands high, and are worth enormous prices. As he is silent on this side of the family tree, we may infer that the true aristocratic bearing of the Poitevin mule is on the mother's side.

The demand for mules by our united armies in the east is now considerable, and the south of France and Spain will furnish the supplies needed. The "superb" breed of Poitevin—now fast diminishing, it would seem—is too costly to fall into the hands of jobbers for the commissariat service. The itinerant dealers have been in the habit of paying for the prime specimens about 500 francs each, at five years old, to the farmers of La Vendée and Deux Sèvres, who buy them when yearlings, in the seven or eight communes of Poitou where they are bred, and work them with careful tending until they reach the full age for profitable labour. *D.*

A LADY-DAY INVENTORY, 1844.

It included live stock, implements, tillage, and the outgoing tenant's rights, which consist of the unexhausted cultivation, in preparing and manuring 86 acres of land which produced a crop of roots last year; the dung made from the consumption of those roots and the Wheat straw since harvest; the manure dropped on 34 acres of Clover, which were pastured by sheep during the summer; and the farm produce of last year's crop which remained unconsumed, valued by —— on the part of the incoming tenant, and by —— on the part of the outgoing tenant.

	£	s.	d.	£	s.	d.
No. 1.—*Live Stock.*—To 5 horses, 2 cows, 118 sheep, 15 pigs, and 33 fowls ...	336	4	0			
No. 2.—*Implements.*—To harness for 4 horses, 3 ploughs, 3 carts, 3 pair of harrows, 1 cultivator, 1 Finlayson's harrow, Turnip drill, 2 rollers, 38 corn staddles, &c., and household furniture ...	235	4	0	571	8	0
No. 3.—*Tillage, or acts of Husbandry.*—To 233½ acres once ploughed, 338 acres harrowed, 128 acres drilled, 33 acres cultivated; 175½ bushels of Wheat, and 37½ acres of Clover seeds...				204	11	[illegible]
No. 4.—*Tenant's Rights.*—To 35 tons of Carrots, 70 tons of Mangold Wurzel, 40 tons of straw, the unconsumed portion of last year's crop	108	15	0			
No. 5.—To unexhausted cultivation in labour and manure in producing 86 acres of roots, the crop of 1843	314	12	4			
No. 6.—*Manure.*—To the manure dropped in consuming 34 acres of Clover crop, 1843, and manure left in the yards, produce of the consumption of 86 acres of roots by stock, and the Wheat straw	374	17	0	798	4	4
				£1574	4	[illegible]

The first and second entry of this inventory (the live stock and implements) are never reckoned to the incoming tenant except by special agreement.

The third entry is a customary valuation made to the incoming tenant by the arbitrators of the two tenants mutually. The fourth, fifth, and sixth entries are never taken any account of, the landlord generally claiming it as belonging to the estate and giving them to his incoming tenant at the expense of the retiring tenant. There is

* We have taken a liberty with the original word, *[illegible]* which we think gives the exact meaning of the indignant expostulator.

however, a trifle given to the outgoing tenant for stacking up the straw and for squaring of the manure-heaps, but this seldom amounts to 5*l.* There is no instance where the outgoing tenant has had any compensation for the unexhausted cultivation and manure left in the soil during the previous year's culture, when the outgoing tenant carted off the Turnip and other root crops. So that in this case the outgoing tenant has been paid 500*l.* as Tenant's rights on the farm of 260 acres, besides live and dead stock, amounting to 570*l.*

By this inventory justice has been done to the outgoing tenant, and therefore the whole of the land has been left in a good state of cultivation, for which the incoming tenant has paid 1002*l.* 16*s.*, and the incoming tenant has received value for this sum in the large crops of Wheat the land produced the first year, and in the large quantity of manure which he had on the farm, which was as much as was required for all his root crops the first year, nor were there any extra expenses for clearing the land in preparing it for his fallow crops.

It must be evident that if the outgoing tenant did not receive the value of all his labour and the produce of his last year's crop, whether it be in a raw state, or for the manure produced from the last year's crop, he would be careless about it, and might greatly injure the land in consuming the crops on it, and of course he would not be careful in what state he left the land to the next tenant. *J. M.*

RAPE CAKE AS FOOD FOR STOCK.

Since the advance in price of Linseed-cake from 6*l* to 12*l.* and more per ton, we used, in the first place, Linseed and Rape-cake mixed in equal proportions; and for the last two years we have used Rape-cake alone. The analyses of Linseed and Rape-cake indicated their equal value for agricultural purposes, having regard to their feeding and manuring capabilities; the only difficulty therefore which presented itself was that Rape-cake was much less palateable to animals than the Linseed-cake. In the raw state we got over this difficulty by a few days' perseverance, and we found the sheep do perfectly well on it, given broken in their troughs in the field. When we used it dissolved in water to pour over chaff in a cooked state for bullocks, the same cake varied very much. Sometimes the dissolved cake on being poured over the chaff was offensive to the smell, and affected the eyes so much that the man could hardly continue the admixture, and the animals rejected the food; at other times nothing of the kind existed, and the mixture was eaten freely. This was very perplexing for a time, but we ultimately discovered this depended entirely upon the temperature of the water into which the cake was put; that when the cake was put into boiling water the evils experienced were completely cured; and that when it was dissolved in water under that temperature they existed in full force.

As Rape-cake has of late been so much used for feeding, I think it may be useful to communicate this fact to your readers. I thought it desirable to ascertain the cause of this phenomenon, as the solution of it might elicit further information as to the composition of Rape-cake, and I therefore mentioned the circumstance to my friend Dr. Voelcker, the skilful chemical professor at our Agricultural College, who wrote to me as follows: "I believe the pungent principle in Rape-cake arises from the presence of Mustard seed, which is often contained in considerable quantities in foreign Rape-cake. Mustard and Rape belong to the same family of plants; and in Germany, at least, I am sorry to say our Rape fields are often very foul with Mustard. That boiling water prevents the pungent, acrid smell, is fully explained by the chemistry of Mustard seed. That seed does not contain any volatile or essential oil of Mustard, the cause of the pungency of Mustard paste; but it does contain two peculiar principles which, in contact with cold or tepid water, generate essential oil of Mustard. The one is called myronic acid by chemists, the other myron. The latter is a substance-like albumen, and, when moistened with cold water, acts as a kind of ferment upon myronic acid, producing the acrid oil of Mustard, whereas boiling water coagulates myron like albumen. In a coagulated state myron loses its efficacy as a ferment, and consequently no pungent or acrid smell is produced when cake containing Mustard is mixed in boiling water. I am not aware that clean Rape-seed contains analogous principles to those in Mustard; but as this is possible, I shall be glad if you will send me a few ounces of decidedly clean Rape seed. A few experiments with such Rape-seed will soon tell me if it contains substances allied to myronic acid and myron in Mustard seed; or if, that which I expect to be the case, your Rape-cake is made from seed containing a mixture of Mustard seed.

"However, the practical result of mixing Rape-cake with boiling water deserves to be generally known, for even pure Mustard cake will lose its poisonous character; or, more correctly speaking, its poisonous qualities will not be called into existence, if it be mixed with water at the temperature of 112° Fahrenheit.

"An analogous case is presented to us in bitter Almonds. There the albuminous substance which acts as a ferment in contact with water is called emulsin. Besides this emulsin, bitter Almonds contain a beautiful crystalline substance called amygdalin. Neither the emulsin nor the amygdalin are poisonous; neither have they any smell; but when both are mixed together in cold water, the emulsin resolves the amygdalin into volatile or essential oil of bitter Almonds, and into hydrocyanic or Prussic acid. Digested with cold water, bitter Almonds gradually generate oil of bitter Almonds and Prussic acid. Digested with boiling water, or heated by themselves to the temperature of 212° Fahrenheit, the emulsin in Almonds coagulates, and no oil of bitter Almonds or Prussic acid is formed."

On the receipt of this highly interesting elucidation of the practical result we had arrived at, I sent to Dr. Voelcker some perfectly clean Rape seed, for the purpose of the experiment proposed in his letter; and I have since received another letter from him, accompanied by a bottle containing some of this seed crushed and digested in cold water for 24 hours. He writes, "The experiments which I have made with the Rape seed you kindly forwarded to me fully confirm my impression, that the strong smell observed when Rape-cake is moistened with cold water is due to the admixture of Mustard seed. I find that Rape seed does not contain any substances analogous to those which in Mustard seed produce the pungent volatile oil of Mustard. Neither cold nor boiling water develop, in pure Rape seed, any pungent principle. The fluid obtained by distilling crushed Rape seed with water faintly smells like the crushed seed, as you will perceive by the bottle I send you. Boiling, tepid, or cold water have the same effect on pure Rape seed. It follows from these experiments that Rape-cake cannot act injuriously, when given to animals, by reason of any irritating substance which it contains, provided it has been made from pure seed, and not, as is frequently the case, largely mixed with Mustard seed."

I have great pleasure in forwarding to you these important explanations from so distinguished a chemist as Dr. Voelcker, as of great practical use to our agricultural brethren, affording, as they do, a very simple mode of distinguishing pure from impure Rape-cake, and confirming, by the aid of science, the mode suggested of rendering the latter comparatively innoxious. *Charles Lawrence, Cirencester, March 3.*

Home Correspondence.

Agricultural Society.—It would be very gratifying to many supporters of the Agricultural Society of England, and a great boon to practical agriculturists, if prizes were given for animals in a proper saleable condition for the butcher, as well as profitable to the breeder and feeder. During the infant days of a society it may be difficult to check the fancy and fashion of the day; opinions, however numerous, must run riot for a time, in order that good may eventually arise from the extravagant flights of its first promoters. Experience and the progress of science will, however, rescue a valuable institution from its youthful mistakes, and raise its character for usefulness. Awarding prizes for quadrupeds whose existence must be a burden to them from the immense masses of fat hanging from their sides has to a certain extent been discontinued, but to give the farmer the full advantage of this change, it is suggested that prizes should be given for various animals whose power of accumulating wholesome meat on their carcases could be proved by reference to age and a Dr. and Cr. account of what has been consumed by each beast during the period of fatting. Persons who are in the habit of supplying beef to the market know what may be done with animals of an inferior description if the owner is willing to open his purse-strings widely. Too much care and attention cannot be paid to crossing to obtain constitution and symmetry, as when both these are apparent in an animal, it may be presumed he will prove a good feeder without pampering, weigh heavy in the scales, and show well on the spit. At all exhibitions "holiday folk" form a considerable item amongst the spectators, who, although they may stare with wonder at an over-fed brute, have their pity rather than their admiration excited for the uncomfortable state the animal must be in, puffing and blowing as if its heart would break. The interest excited throughout the United Kingdom by the meetings of the Royal Agricultural Society is immense, and would be increased fourfold could farmers be sure of having the feeding properties of animals fully tested on the broad £ *s. d.* basis. After all, there is no conviction comes so home as that of the pocket. Eloquence on the back, ribs, and loins of an ox is thrown away in comparison with the weight of a plain statement of the quantity, quality, and cost of the food required to bring the object of admiration to a condition fit for the shambles and the appetite of a healthy man. It is not impossible that an amateur when viewing the stock of a celebrated breeder may have inquired the expense of feeding a beast whose dimensions appeared extraordinary, and may have received for answer, "He is for the next show; I cannot tell what I have spent on him. I expect the prize." *Falcon.*

Cattle Food.—The mode which I have adopted for years is the following. I prepare a compound, 10 lbs. of which are Oat straw cut into chaff, 3 lbs. of Linseed meal, 5 lbs. of Beans and Oats and bran ground, and 10 lbs. of water. This compound is made in the following manner: 3 lbs. of Linseed meal is boiled in 10 lbs. of water for about 15 minutes, and 10 lbs. of chaff being spread out on the floor the liquid is spread over the chaff and mixed together; the straw, the Beans, Oatmeal, and bran are sifted over the chaff, and the whole well mixed together. It is rammed hard down, so as to let the whole be intimately mixed and well saturated. This is the quantity given to two beasts night and morning. The compound is made at night and in the morning; that which is made at night is given first thing in the morning, and what is made in the morning is given about 2 o'clock. So that the times of feeding are—first the compound, say at 6 o'clock; at 8 o'clock they get as many cut Swedes as they can eat; about 2 o'clock they get the remainder of the compound, and at 6 o'clock at night they get as many Swedes as they can eat. They eat daily about 1 cwt. of Swedes, 3 lbs. of Linseed, 5 lbs. of Beans, Oats, and bran, and 10 lbs. of straw cut with chaff. They are regularly littered afresh during the time they are eating their breakfast, and at supper time the litter is again stirred up. As they are in boxes they are never allowed out oftener than once in 8 or 10 weeks; but their litter keeps them perfectly dry and sweet. The Beans, Oats, bran, and Linseed I reckon to be of more value than the same money value of oilcake, and the straw checks the tendency and saves laxativeness produced by roots. *J. M.*

Draining v. *Trenching.*—Let "Leisurely" trench his rushy ground say 20 inches deep. If he cannot afford to destroy the turf he may pare it off, and plant it or lay it down as the trenching proceeds. In numerous instances where rushes grow vigorously the land only requires culture to make it produce abundant crops of our best Grasses without draining; and in the instance in question the water is not stagnant, but finds its way off at the gravel stratum. Two-thirds of the turf will be sufficient to lay down again; the remainder may and ought to be left near the surface, chopped into shreds, which would afford food for the superincumbent turf. My firm opinion is that had the money which has been expended in draining in numerous instances been spent in the proper culture of 18 inches of the surface the results would have been more satisfactory. *Monco.* [We do not agree with our correspondent.]

To the Growers of Hops.—Perhaps few plants have been longer or more forced by cultivation than the Hop; the usual consequences have been of late yearly exhibited, and progressing in intensity of operation—an increasing inability to resist disease. It has been the same with our long cultivated fruit trees; and recent observation has shown, that by reverting to the native stock a healthier plant has been obtained, resisting a greater severity of inclement weather. Why not pursue the same plan with the Hop? The probability of success (if the experiment have not yet been judiciously tried) seems almost certain, and, if so, the consequent value of it is incalculable. In Mr. Ruegg's recent prize report of Dorsetshire farming, he says there is a great prevalence of indigenous Hops in that county; that the late Mr. Mowlam cultivated them, it is thought profitably until his death, and that they were quite free from mildew, lice, &c. *T. Landor, Burton, Feb.* 12.

Lambing Season.—At this period it may not be useless to direct the attention of flock-masters to the simple means by which the evil effects resulting from unusually hard or protracted labour may be in many instances averted. In all cases where much "handling" has been required during parturition, where "draining" supervenes, or in cases of abortion, the administration of the following dose has been found very beneficial:—Two ounces of Epsom salts, 2 drachms of ginger, and 2 drachms of laudanum. Should inflammation ensue, resort may be had to bleeding; but as a rule such patients require all the strength which Nature furnishes. Unless the unfavourable symptoms disappear in the course of 24 hours, repeat the dose. It is from experience that I recommend this mode of treatment, as I feel fully assured that in the two past lambing seasons it has been—in connection with careful nursing—the means of saving many ewes, which under the old methods would have been lost. I send you this with the simple desire that what I have found advantageous in my own experience may be placed at the disposal of other breeders. *T. R. Ellis, Oxnead Hall, Norfolk.*

The Plough.—In the plough we have, no doubt, a very efficient instrument for turning the ground, but will it not admit of a question, except in the breaking up of old leas, whether turning of the ground is a necessary operation; whether the use of the grubber, which has been lately advocated, with other implements for separating a portion of the upper soil from the lower, and for tearing the portion so separated to pieces, may not be found to give as effectual cultivation at far less cost of labour? By the plough, with the action of a wedge, a slice of clay is separated, raised, displaced, and turned over, and, all these operations become necessary for the mere purpose of exposing the under part of this slice to atmospheric action; were it not for this the separation, the under and side cutting of the slice, would be all sufficient. But while a considerable amount of force is necessary to perform these operations by the upper side of the wedge, as much more is lost in the pressure of the lower side of the wedge on the unmoved soil below, and on the land side, to much detriment of the land, especially where clay predominates. I admit that the slice so turned is easily operated on by the harrow, and that in the interstices beneath the sods a small quantity of air is locked up, but this is soon deprived of all its fertilising properties; and the working of grubbers, &c., will, I should think, be more effectually beneficial on the unturned surface than that of the harrow on the turned slices, for the action of the harrow, while it tears the surface, closes it and excludes, to a certain extent, the air, while that of the grubber is to open it and render it pervious to the air, and its tearing action, though it may be less than the harrow on the surface, is much greater in the depth. But we bury weeds by the turning operation of the plough; granted—but if we do, we bury indiscriminately those that rot and decay when so burned and those that thrive, and are rendered more difficult to extirpate afterwards from this covering of them; we obtain a clean surface, which looks well to the eye for a

while, but we destroy no weeds that would not be as effectually destroyed if dragged to the top, and we promote and encourage the growth of many which, if brought to the top, would have dried up and withered by the frosts of winter or the sunbeams of summer, if we did not choose to take the trouble of raking them off. It is also true that in turning the sod we expose a fresh surface to atmospheric action, but is atmospheric action limited to the surface?—will it not equally prevail, and be as powerful in every part of the soil which is opened to its influence? Will it not follow the tines of the grubber? Is it even known to what depth it will penetrate? It is probable it does to some extent into the subsoil; it certainly does into unstirred ground, or lands exhausted by tillage could not recover fertility by being left unstirred in Grass. If this is true surely the turning of the land is unnecessary and its cost would be much more profitably expended in such operations as would go deeper, and more frequently might be applied from their inexpensiveness. Would not a share and coulter with two grubbing tines in lieu of the sole, by the application of the same force that is now used in ordinary ploughing go much deeper, while there would be no pressure on the under soil, which, indeed, would be left as loose as after the spade. *J. M. Goodiff.*

Drainage.—If "Leisurely" has been an attentive reader of the *Agricultural Gazette* since 1853, he will remember seeing in its columns the writer's method of drying a field in every respect analogous to the one he describes. The plan adopted was boring holes from bottoms of the parallel drains into the stratum of gravel every 20 yards or so the whole length of the drain. Down these holes 1-inch pipes were put into the gravel; the water rose and was carried away by the pipes in the drains. In the above case the drains were 3½ feet deep, 30 feet apart, and had only 3 inches of fall in every 100 feet. The making of the holes and putting in of the pipes do not cost ½*d.* per hole, and one year's trial leaves no doubt as to the efficiency of the work. *J. R.*

——From another correspondent we have received the following:—Your correspondent "Leisurely" describes a rushy pasture which, with a total fall of 5½ feet, he has commenced to drain at only 30 inches deep. Why not make use of the total fall? At the lower end of the field where the brook leaves his boundary, it would give to a main drain having its outlet there a depth of 5½ feet, sufficient for any purpose, even supposing the field was of such a length as to make it necessary that the depth at the commencement of the main should be only 30 inches; why the whole field should be drained at this depth I cannot exactly conceive. If the gravel is springy from upland sources, tapping it, as you recommend, of course would remove it; but would it do so in all cases with "the bottoms of the brooks in the district" on the same or perhaps higher levels, and on the same bed of gravel, to feed these drains? In such a case a syphon would be a more correct name for such than a drain, I opine. *Agricola.*

Peas.—It may be useful to some of your readers to know that common white boiling Peas sown at this time in any field prepared for Oats on one ploughing and harrowing in, in fact treated precisely as Oats are, will come in very seasonably for the table, if picked green in July and August, and if not quite as delicate as the garden kinds, are very excellent eating, at any rate make extremely good green Pea soup, forming a very efficient auxiliary crop to the garden forces. As they ripen at different times they will last for six weeks. A third of an acre would supply a family of 20, and those not picked green may be left to ripen for the pigs till harvest time. *Crede Experto.*

Labourers and Masters.—In advocating the cause of the labourer, the interests of the upper and middle classes are not neglected; indeed they are all three so inseparably mixed up together that what is beneficial to one must either, directly or indirectly, affect the others. The capital of the rich would be useless without the assistance of the bone and sinew of the poor. The exertions of the peasant and mechanic would comparatively be thrown away without being backed up by the wealth of the merchant, agriculturist, and manufacturer. We are all equal in the sight of God; each will receive his reward hereafter according to the use he has made of the talent intrusted to his care. There equality terminates in this world. In the distribution of riches, a greater proportion may seem to fall to the lot of men whose circumstances are already independant, and who are free from the pressing wants to which many of their neighbours are liable. Take a large manufacturer who has amassed a fortune sufficient to enable him to retire from business and enjoy (if there can be enjoyment in idleness) the fruits of his speculations. He has a right to do so, but what would be the immediate consequence to those who envy him his daily profits. The sudden stoppage of the ponderous steam-engine would throw a vast amount of labour on the market, and cause much misery amongst the workpeople. To grudge capitalists, whether they employ their money in growing Wheat or spinning cotton, the lion's share of the proceeds, after paying expenses, is both unjust and unfair—what is to compensate for risk?—nevertheless it is the duty of men who reap such a plentiful harvest not to forget those by whose aid they become rich. The neglect of their wants as human beings and Christians entails a fearful responsibility on their employers. If an equal division of property could be made amongst high and low—how long would it last? The Paradise (of fools) would continue long enough for talent and energy, under whatever garb it might be, to run ahead of sloth and indolence, when a balance would be struck and classes again formed, after, no doubt, immense confusion, fighting, and squabbling—the loss of enormous wealth and reputation as a country in the great family of nations during the halcyon days of equality. The stronger the bond of union between master and man, the longer will this country continue to flourish; but it must be on fair grounds, not starving the labourer on the scantiest wages, and casting him off on the slightest pretext—deal with him honestly, and with a generous hand, recollecting he is a man. There will then be some prospect of the farm-servant being raised from the degraded position he now occupies—vegetating—not living. *Falcon.*

Ayrshire Cows.—In reply to "Clericus's" inquiry, I beg to say I would recommend him to apply direct to some breeder in Ayrshire for his cows, and if at all convenient to him, to go over and make his own selection; his advantage would then be two-fold, viz, a certainty of getting pure bred animals, and, secondly, making his own bargain on the spot. If your correspondent will drop a line to either of the following gentlemen, viz., Mr. Robert Kirkwood, of Highlongmuirs, Kilmaurs, or Mr. George Cowan, Wheating, Kilmaurs, both near Kilmarnock, I doubt not he will get supplied with what he requires by either one or both of them, or if not they will refer him to some of their friends who can do so. The first named gentleman was a successful competitor at the Highland Society's show last year at Berwick with this breed of cattle, carrying off several prizes; and I am sure if your correspondent pays them a visit—as I and a friend did last autumn—he will be pleased with their stock, and I think not less so with the kind reception he will meet with. *J. L., Lofthouse, March* 5.

Duchess Cow.—I consider Mr. Wood's information on the Duchess family of short-horns of rather slender description, inasmuch as though Mr. Bates "loved his cattle for their own sake and not for the money he might happen to make of them," yet I have heard through several breeders that the Duchess tribe of short-horns were never first prize-takers at the national shows, on account of slight deficiency in thighs and fore-quarters. That Mr. Bates was fond of them for some of their points is proved by in and in breeding for the purpose of further developing those favourite points; and if Mr. Wood would be kind enough to explain more fully why he considers that no man of our day has possessed such a herd as the late Mr. Bates's, he would be conferring a great benefit on breeders this side of the channel, many of whom have early known the Duchess tribe of short-horns by the pedigree in the "Herd-book," which proves that up to the year 1851, 64 have been registered in the female line, of which there is no account of 28 of them to have bred at all. The remaining 36 are registered to have 110 live calves, being on an average of 3 each cow, and 2 calves over. This appears to be a very small proportion of progeny for 43 years' breeding; and whether in and in breeding is the cause of it, or whether obviating against consanguinity would insure a larger propagation, and whether Norfolk (2377) and Usurer (9763) blood have not caused an improvement in constitution, I will thank Mr. Wood to explain. *John Daly, Charleville, Enniskerry, Ireland.*

Scottish Agricultural Statistics.—From the returns of Scottish agricultural statistics, given in the *Agri. Gazette* of the 10th February, it would appear that the estimate had been very generally given in Scotch acres, which would both account for the great deficiency appearing in the whole extent of the country (nearly 7,000,000 of acres), and also for the high acreable averages stated. More than 3½ quarters of Wheat, 4½ of Barley, the same of Oats, 3½ of Beans, and upwards of 15 tons of Turnips per imperial acre, are high averages, and exceed in the case of Wheat and Turnips those stated for East Lothian in the returns of the preceding year; that was an unfavourable year for both crops, while last season was of an opposite character. Yet, after making allowance, that the averages for the whole country should have exceeded those of the finest county in it was not to have been expected. It may also be remarked, as showing the excellence of the farming, how nearly the figures relating to the arable country represent a five-course rotation (one of the best)—the fallow and fallow or ameliorating crops, Beans, Peas, Turnips, Potatoes, Mangold, Carrots, Vetches, and Cabbage, amounting to 666,380 acres or one-fifth of the whole cultivated land; the corn crops, Wheat, Barley, Oats, Bere, Rye, and Flax to 1,337,314 acres, or two-fifths; and Grass, in the rotation of the farm, to 1,427,790 acres, the remaining two-fifths. *N. Drake.* [The figures refer in every case to imperial measure, not to Scottish or to local measure.]

Seed Wheat.—Some time ago one of your correspondents put a question to me which I am only now enabled to answer; and I answer it willingly, because the subject of seed Wheat is so important to the farmer that it is but fair to him to have every careful experiment of a new sort brought to his notice. The question referred to my experience of Payne's "Defiance Wheat." I have tried it for two years. The first year was the year of almost universal blight, and then the yield was only 26 bushels, after a fair promise before harvest of at least 40. The crop of the second year (1854) was only thrashed out the week before last, and the produce from the 4-acre piece was 20 qrs. and 3 bushels; and, deducting 1*s.* a bushel for 2½ qrs., it was sold last week at a falling market for 60*s.* But, though this looks well; though it gave me, besides, 7 tons of good straw; though the Defiance yields well, and stands up well, and defies the attacks of the birds, I have given it up for the following reasons: The farmer does not like it, because, though sown early, it ripens late; and because the miller does not like it; and because of their dislike *I* do not like it, and because a new system of growing Wheat cannot fairly be tested in comparison with the old but by the growth of the ordinary seed. I have therefore given it up, I own with some regret, and now use for seed a mixed Wheat which, deservedly, as I think, is in great favour with many neighbouring farmers, being a judicious combination of the Lammas and Bristol red, the former for sample and the latter for bulk. *S. Smith, Lois Weedon, March* 10.

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Weekly Council, *March* 14.—Sir Robert Peel, Bart., M.P., in the chair.

Communications and Presents.—Mr. George Sainsbury complained of the annoyance to which the breeders of choice and valuable stock were subjected by the "trespass of neighbours' bulls" when turned out into adjoining pastures. Mr. Towers stated his opinion on the application of steam power to the cultivation of land, adopting the views of Mr. Wren Hoskyns on the subject. Captain Kellermann's paper on the medicinal properties of the leaves of the Black Currant was received through the Foreign Office from Lord Cowley in Paris. Mr. John Howe suggested the destruction of rats by means of fumigation, on the principle adopted by Mr. Browne in his well-known apparatus for fumigating fruit and other trees. Mr. Bethell exhibited specimens, in a moist as well as dry state, of roots reduced to a pulp by machinery. The East India Company transmitted a further supply of Pine seeds, from the Himalayan and other districts of India. The Royal Hanoverian Agricultural Society presented a copy of their Transactions, for which the Council ordered the Journal of the Society to be forwarded in return. Prof. Wilson transmitted a collection of Illustrated Implement-Catalogues, from America.

The Council having ordered their usual acknowledgments for these communications and presents, adjourned over Wednesday, the 21st inst., to their weekly meeting on the 28th of March.

Reviews.

The Agricultural Cyclopedia. Edited by John C. Morton. Blackie & Son, Glasgow, Edinburgh, and London.

It will be allowed us to intimate the completion of this work. It has appeared in 28 parts, and is now published in two large volumes. Among the 60 or 70 who have contributed to its pages are Dr. Lindley, Mr. Bentham, and the Rev. M. J. Berkeley, who have written the botanical articles; Dr. Lyon Playfair, Mr. Way, and Dr. Voelcker, who have contributed its chemistry; Messrs. Trimmer and Morton, well-known writers on the geology of agriculture; Mr. Curtis, who has written all the entomological articles, and Professor Buckman, who has written several articles on natural history.

Among those who have written papers on some of the more general aspects of agriculture are Mr. Hoskyns and Mr. Pusey. Articles on the several crops are written by cultivators of them; the arboricultural portion of the work has been written by Messrs. Grigor of Forres and of Norwich; agricultural implements are described by the editor; agricultural engineering is treated by Mr. Newlands, borough engineer of Liverpool, by Mr. Bravender, and Mr. Girdwood. Animals are described and their management discussed by well-known breeders; and Mr. Spooner refers to their diseases; and such names as Gray of Dilston, Caird of Baldoon, Wilson of Edington Mains, Baker of Writtle, Haxton of Drumnod, Paine of Farnham, Clarke of Long Sutton, and many others are among the contributors. The volumes are abundantly illustrated by wood-cuts and engravings.

Miscellaneous.

What is a Bargain?—A trial in the Southampton County Court the other day has given occasion to a decision on this subject by Judge Gale.

Gulliver v. *Harris.*—A plaint for 10*l.*, the action being brought to recover the difference between the price at which the defendant had agreed to sell to the plaintiff a quantity of Wheat, and the price to which it had arrived in the market upon the defendant's refusal to deliver it. Mr. Pocock stated the case: Mr. Gulliver, a farmer at Wimpson, on the 17th of October last, agreed with Mr. Harris, butcher, Abovebar, Southampton, and who rents some land adjoining the plaintiff, to purchase of him 30 quarters of Wheat, at 5*l.* 10*s.* a load, and Mr. Harris inquired where he should deliver it, implying, of course, that according to the custom of farmers selling, he should deliver it anywhere within a moderate distance the buyer might desire. Mr. Gulliver said he would let him know in a day or two, and went away. He then went to the barn (at Wimpson) and took a sample of the Wheat, it not being necessary he should take one from Mr. Harris at the time, as it was conditioned the Wheat should weigh 65 lbs. a bushel. He bought the Wheat on a Tuesday, and sold it on Wednesday (next day), to Mr. Ray, farmer and miller at Woodmill. On Friday he wanted the Wheat to be delivered, but Mr. Harris refused to do so, assigning as a reason that the markets were going up! Mr. Gulliver, having sold the Wheat, and being unable to deliver it, had to compromise with the buyer in consequence, and paid Mr. Ray so. Mr. Pocock concluded by saying that business in the markets would be at an end if bargains could be repudiated or got rid of in any such way. The loss between the price agreed for and that at which the Wheat arrived he should show to be 8*l.* 8*s.*

After evidence had been given,

Mr. Leigh, for the defendant, said the plaint could not be maintained, for under the statute of frauds, as he need hardly state to his honour, no contract was binding where the consideration amounted to 10*l.* and upwards, unless it was made in writing, or

part payment made, or delivery and acceptance of part of the articles made. The Judge said that Mr. Leigh need not proceed further in the case as the action could not be maintained, and proceeded to quote some cases in Selwyn's "Nisi Prius" bearing on the case, but in fact the statute of frauds, passed so long ago as Charles the Second's time, quite established the rule of law that such a contract as this for the sale of so much Wheat ought to have been in writing, and the non-delivery did not take it out of the statute. Wheat was sold by sealed notes in London. Mr. Pocock said he, of course, took the law from his honour, but there would be an end to all bargains in the agricultural markets if it were to be so ruled. The Judge said they would all be void in law. If the farmers chose to deal upon honour they must take the consequences.

Dr. Kirkpatrick's Report on National Agricultural Schools, 1854.

The New Market, Copenhagen Fields.—It is rumoured that it will be opened about the middle of April. It has been ready for use in almost all its parts for a considerable time.

Calendar of Operations.

MARCH.

Lammermuir Sheep Farm, *March* 12.—Since the middle of January we have had a very severe snow storm, more severe than has been experienced for the last 15 years. Though there has been little drift, there has been a most intense frost. With an interval of a week sheep have been fed with hay night and morning since the 24th of January; and the crop, which at hay harvest was reckoned most abundant, has in many places been found no more than sufficient to supply the large demands which have necessarily been made upon it. Though there is a fine south wind to-night yet we are by no means certain that we have seen the last of the storm—a continuance of which for another 10 days would see the majority of flock masters in extremities for fodder. Cheviot ewes are now being put on to Turnips; it is desirable to allow them a month's Turnips previous to lambing, and if possible a fortnight after. On those farms where it is usual to winter ewe hogs without Turnips the gimmers require to be put on a week or two earlier than the more aged ewes, as never having eaten Turnips they are a considerable time before they learn to eat them. Cheviot wedder hogs are frequently turned off Turnips to the hill about the middle of this month; when practicable, however, they ought to remain on during the whole month of March, and in the present season this will be the more necessary, as from the long duration of the snow storm they were often but scantily supplied with Turnips, and did little more than keep what condition they had. It is yet premature to say whether hill stock generally have stood the winter well or not, as their deficiencies never appear till some time after fresh weather fairly sets in. It is then that the effects of the storm become visible, and very frequently sheep, which during the snow have pleased the eye pretty well, appear shaken and haggard on the return of fresh. *J. S. B.*

Wester Ross, *March* 12.—At this date in ordinary seasons we are all busily engaged sowing in the seed; this year we have scarcely as yet got the plough into the ground, and it will take a considerable time ere the soil be in a fit state for harrowing. It would be rash and premature to conclude that, as the winter has encroached far upon the spring, our harvest must necessarily be correspondingly late, for it is quite possible and not at all unlikely that our spring and summer weather may be such as will make up for all detentions. Wheat when freed from its winter's cloak looked withered and lifeless; now it begins to recover, and looks quite thick enough. Sowing Wheat is likely to be much interfered with, and less than the usual quantity will now be sown. Turnips are complained of as being much destroyed by the intensity and continuance of the frost. The softer sorts suffer most in this way, and all that were injured by accident or game are totally lost. Sheep had difficulty in eating as many frozen Turnips as would keep them in *statu quo*, and cattle in open courts felt much the severity of the winter. The price of grain has been for some time very unsteady, and tending downs. Exhibitions of corn have been held in connection with the different agricultural societies in the north, and the weights of the different kinds of grain range as follows:—Spring Wheat, 63½ lbs.; Barley, from 56 to 60 lbs.; Oats, from 43 to 46 lbs..; Rye-grass, 28 lbs. per bushel, clearly showing that the stuffs we grow in this quarter are anything but despicable.

Notices to Correspondents.

Analysis of Soils: *W T.* Consult the Appendix to Johnston's "Agricultural Chemistry."

Liquid Manuring: *R W.* You will find all that is published on the subject in the last year's volume of this Journal. Consult its Index. We will endeavour to obtain the details you ask for in reference to the Ayrshire farm.

Salt, &c.: *Three Years' Subscriber.* If sown in wet weather, a cwt. per acre. You may sow Clover and Rye-grass land a week afterwards without their being hurt. On a sheep-house see what is said of Mr. Kennedy's in the article on Italian Rye-grass last week. We cannot give estimates of cost.

Two-Horse Power: *H W.* You must state your quantity of water, and then the size of wheel can be named over which that water would be two-horse power; or state your fall, and then we can tell you how much water you will need. Multiply the volume of water per minute by 62½ (which is the weight in pounds of 1 cubic foot), and that by the fall in feet, and divide by 33,000, and you have the theoretical number of horse-power. In practice you get about three-fifths of this by an overshot wheel.

MAY'S MAGNUM BONUM LETTUCE.—In calling attention to the letter below, we beg to say that we are entire strangers to the gentleman, and know nothing further of him than what the letter says. He objects to having his name made public, but any party can have the name and address by sending to us.

"To Mr. May. "March 6th, 1855.

"Sir,—I see your Advertisement in the *Gardeners' Chronicle* of the Magnum Bonum Lettuce. You are right in saying the Lettuces are most magnificent; they are indeed so. Although I only grow Vegetables for my own use, I had quite a run upon me for them last year from friends, and one and all pronounced them the most splendid they ever saw. Indeed, when telling some friends (gardeners) about them, they looked at me thinking I was romancing, but when they came to my garden and saw them, they held up their hands in amazement. Not only were they out of sight the largest ever I saw, but though I have for many years grown all kinds, they were the crispest and sweetest I ever met with. My soil is very thin and light, however, I managed to have them so large that in sending them to friends I put them in one of those open round bushel baskets which come from Rotterdam with fruit. After I got in three, I had to squeeze them a good deal to get in a fourth. I could have put in two dozen of my best Cos Lettuces of the same year's growth. I enclose 24 stamps, and will feel obliged by your sending me two packets of the seed."

Price, per packet, 1*s*., and would recommend early application, as the stock of seed is getting very small.—Address Henry May, The Hope Nurseries, near Bedale, Yorkshire.

IMPORTANT TO ALL PLANTERS WHO DESIRE IMMEDIATE EFFECT.

WM. JACKSON and CO., Bedale, Yorkshire, will supply the following choice stock, of good quality, at the annexed low prices:—

	s.	d.
*12 Abies Menziesi, 2 to 3 feet	20	0
12 „ Morinda, 4 feet, fine specimens	20	0
*12 „ Douglasi, 3 to 4 feet, do., from seed	70	0
*12 Pinus cembra, 4 feet, fine specimens, do.	25	0
*12 „ excelsa, 2 to 3 feet, do. do.	20	0

MESSRS. WILLIAM ROLLISSON and SONS beg to inform their Patrons and the Public that their NEW CATALOGUE OF SEEDS for 1855 is now ready, and will be forwarded post free on application.

W. R. & Sons embrace this medium of stating that many of the Seeds most difficult to obtain true, such as Beet, Lettuce, the Brassica tribe, &c., &c., are of their own saving, and the others have been procured from growers of the highest reputation; particular attention having been paid to secure the German Flower Seeds from eminent sources; are therefore able to state with confidence that the whole of their seeds are of very superior quality. W. R. & Sons respectfully invite attention to the following Choice Flower Seeds, selected from their Catalogue:—

	s.	d.
Alonsoa Warscewiczi, a beautiful half hardy annual, of graceful habit, with spikes of scarlet flowers	2	6
Arctotis breviscapa, a free flowering showy annual from the Cape	1	0
Aster, new Pæony pyramidal, in collections of 12 distinct colours	3	6
Aster, dwarf bouquet, or nosegay, ditto ditto	3	6
Canna Warscewiczi, ornamental foliage plant	1	6
Centauridium Drummondi, orange coloured, very showy ...	0	6
Chenopodium atriplex, ornamental foliage plant	1	6
Clintonia pulchella, a lovely little blue flower	0	6
Coreopsis coronata, bright yellow, free flowering	0	6
Dianthus Dunnetti superbus, double Sweet William, of brilliant colour and dwarf habit	1	0
Digitalis (Foxglove), extra choice, saved from a collection of splendid spotted flowers	1	6
Elichrysum compositum maximum, large double flowers of many colours	1	6
Eschscholtzia tenuifolia, straw coloured, very distinct ...	1	6
Eucnida bartonioides, yellow, very beautiful	0	6
Gypsophila muralis, red flowers, very neat	1	0
Helianthus angophyllus, silvery foliage, very ornamental ...	2	6
Hibiscus Thunbergi, yellow, showy	0	6
Ipomœa limbata, a tender climber, Tyrian purple, with white margin, beautiful...	2	0
Lilium giganteum	5	0
Limnanthes sulphurea odorata, yellow, edged with white ...	1	6
Linum grandiflorum rubrum, a large bright crimson Linum from Algiers, with brilliancy of colour and style of flower which surpass three-fourths of the usual pot plants used for decorating the conservatory	2	6
Pansy, extra choice, saved from superb flowers	2	6
Phlox Drummondi, extra fine, mixed	0	6
Primula sinensis fimbriata, alba, and rubra, saved from superb flowers, each	2	6
Reseda myriophylla, a very distinct new Mignonette ...	1	0
Sabbatia campestris, fine rose with yellow centre, really beautiful	1	0
Stock, dwarf double autumn flowering, in collections of 12 distinct colours	3	0
Stock, new large flowering German, in collections of 12 distinct colours	3	6
Tropæolum Lille Schmidt, good for winter blooming ...	0	6
Vittadinia lobata, pink, very compact and dwarf	1	0
Whitlavia grandiflora, large dark violet bell-shaped flowers	1	6

Messrs. W. Rollisson & Sons are desirous of directing especial attention to their fine Collection of Fruits, which contains all the choicest varieties in cultivation. The rare Cymbidium eburneum is now in blossom and can be seen at the

Nursery, Tooting, London.—March 17.

FISHER, HOLMES, and CO. beg to offer the following, all of which are good sized healthy plants, such as they feel assured cannot fail to give satisfaction:—

	Each—s.	d.		Each—s.	d.
Begonia Prestoniensis ...	1	0	Eranthemum leuconervum	1	0
Æschinanthus splendidus	1	6	Cantua dependens ...	0	9
Rogeria amœna	1	6	„ bicolor	0	9
Hoya bella	1	0	Mitraria coccinea ...	0	9
„ campanulata ...	1	6	Lycopodium umbrosum ...	1	0
Allamanda neriifolia ...	1	6	„ viticulosum ...	1	0
Ixora coccinea	1	6	„ apothecum ...	1	0
„ „ smaller ...	1	0	„ lousianum ...	1	0
Burchellia capensis ...	1	6	„ Pœppigianum	1	0
Franciscea confertifolia, flowering plants 1*s*. 6*d*. to	2	6	„ cæsia arborea	1	0
Cypripedium insigne ...	2	6	Doodia aspera	1	0
Henfreya scandens ...	1	0	Humea elegans, strong, for flowering this season, 1*s*. to	1	6
Justicia coccinea	1	6	Fuschia Duke of Wellington	0	9
Hexacentris myosoriensis	1	6	White Fairy Rose ...	0	6

The following smaller but nice established plants:—

Cyrtoceras reflexa ...	1	6	Hoya picta	2	6
Pentas rosea	1	0	Tacsonia molissima ...	1	0
			Yucca aloefolia	1	6

Azalea indica Apollo, Amabilis, Aurantia superbe, Decora, Duke of Wellington, double white, Extrani, formosa, Frosti, fulgens, Gem, Glory of Sunning Hill, Hebe, Ignescens, Lucombe majesta, Murrayana, Optima, Prima Donna, refulgens, and splendens. The above 1*s*. to 1*s*. 6*d*. each, all strong healthy bushy plants. Remittances from unknown correspondents will oblige.

Handsworth Nursery, Sheffield, March 17.

MESSRS. E. G. HENDERSON and SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out April 30, 1855, the following new Seedling FUCHSIAS, raised by Messrs. Story and Banks.

Queen Victoria (Story's), scarlet, with white corolla. 10*s*. 6*d*.
Prince Albert (Banks's), fine violet corolla. 10*s*. 6*d*.
Perrugino (Story's), fine striped corolla. 10*s*. 6*d*.
Empress Eugenie (Story's), rosy crimson, white corolla. 10*s*. 6*d*.
Ranunculæflora (Story's). fine double white corolla. 21*s*.
Lady of the Lake (Story's), blush, white corolla. 10*s*. 6*d*.
Water Nymph (Story's), globe-flowered, fine white corolla. 10*s*. 6*d*.
Raffaelle (Story's), beautiful variegated corolla. 10*s*. 6*d*.
Mrs. Story (Story's), fine white corolla. (In accordance with Mr. Story's wish, this was named after Mrs. Story, as it was in his opinion the finest.) 10*s*. 6*d*.

Or if the set of Nine are taken, the price 4*l*. 4*s*., including SNOWDROP (Story's). This was received from Mr. Story as possessing a double white corolla, and described by himself and others who saw it in flower as a very beautiful variety. It was the first double white raised by him; but the plant did not flower in the Wellington Nursery after it was received by Messrs. Henderson; and through three stout branches having been broken off it, it did not quite correspond with the description given by Mr. Story and others a few months after to Mr. A. Henderson when at Newton making inquiries respecting the Plants. Consequently no charge will be made for it, but one will be presented with every set ordered.

FUCHSIA, BANKS'S FAVOURITE (BANKS), considered the finest of the blue violet corollas. 10*s*. 6*d*.

For further particulars see page 62 of the *Gardeners' Chronicle* for Jan. 27; or a list will be sent post free on application.

Messrs. E. G. HENDERSON & SON having purchased of the late W. Story, Esq., of Newton, in the county of Devon, for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, which new feature in this tribe he succeeded in introducing, and in consequence of an advertisement which appeared in the *Gardeners' Chronicle* some few weeks back from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, and after a written communication with that gentleman, it was thought necessary for one of the firm to make further inquiries about them, and in consequence Mr. Andrew Henderson went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of a great number of their customers throughout the autumn having ordered plants of them at higher prices than are above quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to the above.

Messrs. E. G. HENDERSON & SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their patrons and the public that their New Catalogue of Seeds for 1855 is now ready, with full descriptions and other information, and will be forwarded post free on application.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

	Per packet—s.	d.		Per packet—s.	d.
Antirrhinum, extra fine ...	0	6	Ipomœa limbata	2	6
Auricula, fine mixed ...	1	6	Leptosiphon luteum ...	0	6
Abronia umbellata	1	6	„ aureum	1	6
Anagallis azurea grandiflora	1	0	Linum grandiflorum rubrum 1*s*. 6*d*., and	2	6
„ rubra „	1	0	Lobelia Queen Victoria (scarlet)	0	6
Arctotis breviscapa ...	0	6	Lobelia Roi Leopold ...	0	6
Aster, new Peony pyramid, in packets of 10 distinct colours, separate ...	3	6	Larkspur, new double improved hyacinth flowered, in packets of 6 distinct colours ...	2	6

1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1½-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by Barnard & Bishop, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address Inglis & Chisholm, Charles Street, Garratt, Manchester.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—Maw & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
Improved and Newly Patented.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to Cottam & Hallen, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4s. 6d. each; Four Tine Forks, 5s. 6d. each. A liberal allowance on Wholesale Orders.

William Dray & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

CAUTION.

Parkes' Steel Digging Forks and Draining Tools.—Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.

Canonmills Bridge, Edinburgh.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of all Ironmongers and Nurserymen, and Wholesale and Retail of William Dray & Co., Agricultural Implement Makers, Swan Lane, London.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which Richmond and Chandler have attained in the manufacture of Agricultural Implements; and the recent improvements made upon the various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated as of the highest value in the economical preparation of food for cattle.—Address Richmond & Chandler, Salford, Manchester, and South John Street, Liverpool. Catalogues gratis.

TO MANURE MAKERS AND FARMERS.

SULPHATE OR MURIATE OF AMMONIA.—These powerful fertilisers, genuine as manufactured, may be had in any quantities from Read Holliday, Ammonia and Soda Works, Huddersfield.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will lock together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.: also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2½ "	long 3 " 3 "		1 15 0
3 "	ditto 3 " 6 "		2 12 0
3½ "	ditto 3 " 6 "		2 18 0
4 "	ditto 3 " 6 "		3 5 0
2½ "	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

FREDERICK PHILLIPS' PATENT.

THE PRIZE PULPING MACHINE of the Royal Agricultural Society's Show, held at Lincoln, July, 1854.

Of all the Pulping Machines which are before the Public, this is the only one which the Royal Agricultural Society certifies as "breaking the roots well,"—all others are certified as slicers see their *Journal*, just published, page 373, also in the article on "Diminishing the Quantity of Roots in Fattening Cattle," page 490), and the great braggadocia "No Other," advertised weekly, although tried against that of F. P. and others, was not placed at all, in fact was "nowhere."

F. P. is happy to inform his numerous applicants for his Machine, that he has greatly simplified its construction without affecting its efficiency, and has reduced its price from 11l. 11s. to 7l. with Floor, and 6l. 10s. without boarded Floor.

Orders addressed to Frederick Phillips, near Brandon, Suffolk, promptly attended to.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

LOOKER'S PATENT VENTILATORS

For Workhouses, Barracks, Factories, Workshops, Greenhouses, Stables, Farm Buildings, &c. &c.

The cheapest but most effectual method yet introduced for admitting fresh air into any kind of building without cold or draught.

Made in Pottery, Metal, or other material of any shape or size to suit every situation, and so arranged that they may be regulated with perfect ease to any point.—Particulars, with prices, &c., forwarded to any part of the United Kingdom, on application to the Inventor, Patentee, and Manufacturer,

BENJAMIN LOOKER, Jun., Kingston-on-Thames.

GREAT saving in the cost of BREAD by the use of WM. DRAY & Co.'s DOMESTIC FLOUR MILLS. Lists of Prices forwarded on application to WM. DRAY & Co., Swan Lane, Thames Street, London.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO Marble and Stone Works, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s*. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Farmers to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES (15 oz.) of good quality, in boxes of 100 feet each. Sizes from 7 in. by 5 in., to 9 in. by 7 in., at 12*s*. per box; 9½ in. by 7½ in., 10 in. by 8 in., and 10½ in. by 8½ in., at 14*s*. per box. In 21 oz., at 1*s*. per box extra.) Larger sizes in stock, of 15 oz., 2*d*. per foot; 21 oz., 3*d*. per foot. Boxes charged 2*s*. each, and returnable at the same price, if delivered free. Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s*. 8*d*. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d*.; Thick ditto, five quires, 1*s*.; Albert and Queen's sizes, five quires for 6*d*., 9*d*., and 1*s*.; Note-paper made from Straw, 2*s*. 6*d*. per ream; Envelopes, 4*d*. to 1*s*. 6*d*. per hundred; Foolscap paper, 7*s*. 6*d*. per ream; Copybooks 2*s*. 6*d* per dozen. Card Plate engraved, 2*s*. 6*d*.; 100 Cards printed, 2*s*. 6*d*. Wedding orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands.—Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s*. sent carriage free. LOCKWOOD'S celebrated Nugget (Gilt) Pen, 1 doz. post free for 13 stamps.

TO BE SOLD, by private treaty, a NURSERY and PLANT BUSINESS, established nearly 70 years. The Proprietor of this old-established Nursery Business is willing to retire, and dispose of the Stock and Good-will. The nursery comprises about 20 acres of ground, and about 15 large and commodious Stove, Greenhouse, and Propagating Houses, with numerous Pits, frames, &c. *The business is in full working order, and is capable of being increased to almost any extent, and of being made one of the best provincial nurseries in the kingdom.* The stock is in a flourishing condition, being young, healthy, and in good saleable order, and comprises a general assortment of all the most saleable Forest Trees, Shrubs, Fruit Trees, Stove, Greenhouse, and Miscellaneous Plants. The Nurseries are situated close and adjoining one of the largest towns in the West of England, with a population of more than 100,000 inhabitants. The whole of the land, houses, &c., belongs to the proprietor, *who will have no objection to grant a long lease to his successor or successors, and at least one-half of the purchase money could remain on security at common interest.* The business has been carried on with great success by the present proprietor, which partly contributes to his retiring from the business. None but principals and *bond fide* purchasers will be treated with.—Apply to Mr. WILLIAM E. RENDLE, Union Road, Plymouth.

TO LET, for a term of years, from Lady-day next, a compact SHEEP AND TURNIP FARM, Seaton, near Axminster, on the South Coast of Devon, comprising a good Farm House, convenient Offices, and 205 a. 1 r. 34 p. of Land, of which 29 a. 1 r. is Meadow, 2 a. 3 r. 4 p. Orchard, 18 a. 2 r. 25 p. Pasture, and 154 a. 3 r. 5 p. Arable. The whole within a ring fence, and near good Market Towns and Seaports.—To view apply to Mr. THOMAS AYNSLEY, at the Farm; and for particulars, by letter, to Mr. BABBAGE, Nettlecombe, Taunton.—March 17.

TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of TESTWOOD, in the Parish of Eling, in the County of Southampton. It consists of about 357 acres, of which 60 acres are excellent Water Meadow, 265 acres of excellent Arable Land, and 32 acres of Rough Pasture, which is to be converted into Arable Land. There is a good Farm House, and large commodious Farm Buildings. The Farm is about five miles from Southampton, and the turnpike road from there to Salisbury passes through it. It is within 1½ miles of Eling Railway Station and Wharf on the Southampton ride.—For particulars apply to Messrs. COXWILL & BASSETT, Southampton; or Mr. JOHN MORTON, Nailsworth, Gloucestershire. A person at Testwood House will be directed to show the Farm.

NURSERY AND SEED BUSINESS,
ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.—Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO MARKET GARDENERS, NURSERYMEN & OTHERS.

TO BE LET or SOLD, 17 acres of Freehold Arable Land, Tithe free, in the County of Surrey, 20 miles from London, with frontage to a good Road, and adjoining the Guildford and Basingstoke Canals, and 1½ miles from Stations on the South Western Railway. Well situated for a Gentleman's Seat, Building Society, or Market Garden.—Particulars of Mr. CLARK, Girdlers' Hall, Basinghall Street, City.

TO MARKET GARDENERS, AND OTHERS.

SALE OF THE ENTIRE HERD OF PURE-BRED NORTH DEVON CATTLE, AND SUFFOLK HORSES, THE PROPERTY OF THE RIGHT HON. THE EARL OF AYLESFORD, AT THE DAIRY FARM, PACKINGTON, IN THE COUNTY OF WARWICK.

BROWN AND CLARKE have the pleasure to announce to the admirers and breeders of Devon Cattle, that the Sale of pure-bred DEVONS, the property of the Right Honourable the Earl of Aylesford, will take place at the Dairy Farm, Packington, on FRIDAY, the 23d March, on which occasion they will have the honour to submit by Auction the following STOCK, viz.:—55 Cows and Heifers, in milk or in calf, and their young Calves; 40 Two-year-old and Yearling Heifers; 30 Three-year-old, Two-year-old, and Yearling Steers; 4 Bulls, various ages. The Cattle to be offered at the sale will be found to possess the highest degree of purity and most beautiful symmetry, having been bred by the noble proprietor from beasts purchased out of the best herds in the kingdom. The young stock possesses all the most desirable qualities of this justly admired breed.

HORSES AND COLTS.

Two Suffolk Mares in foal, and 3 Barren Mares; 2 Three-year-old, 1 Two-year-old, and 2 Yearling Chesnut Suffolk Colts; 2 Three-year-old, 3 Two-year-old, and 2 Yearling Filleys; 1 Two-year-old Black Filley; a superior Suffolk Stallion "Punch;" 9 powerful Draught Horses. Luncheon on the table at half-past 10 o'clock, and the sale to commence at half-past 11 precisely. Catalogues may be had at the Dairy Farm, Packington; Mr. NEWTON, the Farm Bailiff, Meriden; Spread Eagle, Rugby; Warwick Arm, Warwick; and the Auctioneers, Coventry. The place of sale is within three miles of the Hampton, and three and a half miles of the Coleshill Stations, on the London and North-Western Railway.

READ'S GARDEN ENGINES, SYRINGES, &c.

WHEN an article of real utility attracts public attention, IMITATORS start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice of exhibiting in the windows of ironmongers and other, Syringes of the VERY COMMONEST DESCRIPTION, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

READ'S Instruments have the ROYAL ARMS, with the Address—35, REGENT CIRCUS, LONDON.

*** A liberal discount allowed to Nurserymen, Seedsmen, &c., &c.—Descriptions sent Post free.

YOUELL AND CO.

BEG RESPECTFULLY to refer the Subscribers to the *Gardeners' Chronicle* to their advertisement which appeared in last week's Paper, containing a detailed List, with prices, of some very choice "Greenhouse Plants," "Rare and Hardy Conifers," "Hardy Ornamental Shrubs and Climbers," "Fastolff Raspberry," with other desirable fruits; "Choice Flower Seeds for present Sowing," Norfolk Hero Cucumber, &c. &c.

☞ In our Advertisement last week, p. 150, *for* Picea pinsapo, 2½ to 3 ft. fine specimens, each 3*s.* 6*d.*, per doz. 42*s.*, *read* 31*s.* 6*d.* to 42*s.* each

ROYAL NURSERY, GREAT YARMOUTH.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

BEDDING AND OTHER PLANTS.

T. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Cinerarias in variety, Primula sinensis, Acacia armata, Deutzia gracilis, Erica Willmorea, &c. The Trade supplied.—Dulwich, Surrey, March 17.

GEORGE SMITH'S PRICED AND DESCRIPTIVE CATALOGUE of first-class Verbenas, Fuchsias, Geraniums (Show, Fancy, Variegated, and Scarlet), Dahlias, Chrysanthemums, splendid new Hollyhocks, very choice Petunias, &c., will be forwarded in return for one postage stamp.

The Geraniums are in extra fine condition, and require repotting. Parties giving orders immediately will save much in carriage, with less liability to damage by having them before they are repotted. Choice Verbena Seed from the finest show flowers.—Tollington Nursery, Hornsey Road, Islington, London.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by inclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

WILLIAMS' EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, have strong Plants of the above now ready for delivery. This highly interesting and valuable addition to the class of Evergreen Climbing Roses was raised by the late John Williams, Esq., of Pitmaston. It is a Seedling from Ayrshire Splendens, fertilised with Yellow Tea. Its rapid growth and elegant habit is precisely like the Ayrshire Splendens, while its glossy foliage and long lemon-coloured buds partake of the character of the Yellow Tea. Its flowers are creamy white, deliciously sweet-scented, and are borne in long racemes of 12 to 20 on a single shoot, being produced from every axil. It is highly desirable for covering walls, lattice work, verandahs, or buildings of any kind, and, as a pillar Rose, is unequalled, being of an extremely elegant habit for forming festoons or arches, and is also very hardy. For Bouquets it is a most beautiful variety, producing an immense number of its finely-formed buds. It only requires to be grown to be pronounced the best Climbing Rose for all purposes in cultivation.

Good established Plants at 3*s.* 6*d.* each, with the usual allowance to the trade, and a further reduction when one dozen or more are ordered at once.

NORTH CHINA SUGAR CANE—(HOLCUS SACCHARATUS). NEW CHINESE POTATO—(DIOSCOREA BATATAS).

MR. JOHN HENDERSON, of Kingskerswell, South Devon, is still prepared to supply and warrant genuine Seeds of the above Sugar Cane, and tubers of the New Chinese Potato, with description of the Chinese mode of culture at the following prices free, for cash:—

Holcus Saccharatus, in packets, at 1*s.*, 2*s.* 6*d.*, and 5*s.* each.
Dioscorea Batatas—four tubers, 10*s.*; ten ditto, 1*l.* 2*s.* 6*d.*

For further particulars as to culture, &c., see a pamphlet descriptive of the nature and progress of these plants, with directions for cultivation, by JOHN HENDERSON, price 1*s.*, published by Mr. S. JOHNSON, St. Martin's Lane, and to be had of all booksellers. Post Office Orders are requested to be made payable at Newton Abbott, South Devon.

NEW ASHLEAF—THE "EARLY CHAMPION."

JOSEPH WILSON, SEEDSMAN, Ipswich, begs to call attention to the following varieties:—

The CHAMPION ASHLEAF, 12*s.* (per bushel, 56 lbs.), is decidedly the finest in cultivation; it is healthy, hardy, and prolific, and for delicacy of flavour it is impossible to be surpassed.

The BRITISH QUEENS, the earliest round variety known. The stock on hand this week is a remarkably fine sample for "sets," and can with confidence be recommended. The following testimonial is worthy of note:—

"SIR.—The quarter of a peck of British Queens you sent me last year on trial has produced over 2 bushels of very fine Potatoes; in fact I have not seen such a crop for the last 20 years, and I have much pleasure in recommending them to your numerous customers. Signed J. BASTING, Gardener to
"Mr. J. Wilson. Mrs. Campbell, Birkfield Lodge."

The new Mammoth variety, LORD RAGLAN, 42*s.*; and the MOSS KIDNEY, 24*s.* per sack of 16 stones as 2d Early's, and well worthy of a trial by large growers for sale.

Free to London for orders of 4 bushels and upwards. No charge for bags or sacks.

TO POTATO GROWERS.—ROSS'S AMERICAN EARLY, grown expressly for Seed on reclaimed Peat or Moor without manure. This well-known productive Potato cannot be equalled as a "second early;" price 21*s.* per sack of 2 cwt.

WALKER'S LARGE WHITE.—This variety is about two weeks later than the preceding, and for general crops cannot be surpassed. It grows to a large size, is an extraordinary cropper, and for table use is all that could be desired; price 24*s.* per sack of 2 cwt. *These prices include a strong sack, and carriage paid to London, Liverpool, and Hull.*

W. DRUMMOND AND SONS, SEEDSMEN, Stirling, N.B.

*** To prevent disappointment unknown correspondents will enclose a remittance with their order.

CHARLES SHARP begs to call the attention of the Nobility, Gentry, and the Trade to his unrivalled collection of SEED POTATOES, which have been grown and selected with great care, and perfectly free from disease. The undermentioned prices include hampers and package. Terms to the Trade known on application.

POTATOES:—

	Per bush. of 4 st.		Per bush. of 4 st.
Ash-leaf Kidney (Jackson's)	10*s.*	American Early	7*s.*
Ash-leafed Kidney (Walnut-leafed)	10*s.*	Forty-Fold	8*s.*

Red Tankard	

W. J. EPPS can with confidence offer the above (not large quantities), having been grown from the best selected stocks possible.—Prices sent on application.

Seed Establishment, High Street, Maidstone, March 17.

AGRICULTURAL SEEDS, MEADOW & PASTURE GRASSES, &c.

PETER LAWSON AND SON, of Edinburgh and London, the QUEEN'S SEEDSMEN, NURSERYMEN, and WOOD FORESTERS; and to the HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S. are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

GRASS SEEDS, SEPARATE OR MIXED.—*Gentlemen intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.* Price 24*s.* to 32*s.* per acre for Permanent Pasture.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

PERMANENT PASTURE.

H. R. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., &c., to lay down Land to Permanent Pasture, at 25*s.* per acre, allowing three bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—

Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre ... ... 30*s.* per acre.
Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32*s.* per acre.
Mixtures for improving and renovating old Grass Land, 1*s.* per lb.
Mixtures (finest sorts) for forming Lawns... ... 1*s.* 3*d.* per lb.

These Seeds are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE is now ready, and will be forwarded free on application.

GEORGE GIBBS & CO., SEEDSMEN,
26, Down Street, Piccadilly, London.

TO PLANTERS.

HAY, SANGSTER, AND CO., have for sale the following;—600 to 700 strong Standard PEARS, 500 Dwarf do., and 100 Dwarf-trained do. Any reasonable offer will not be refused, as the ground must be cleared by the 25th March.

Apply to HAY, SANGSTER, & Co., Newington Butts, London; of whom also may be had for seed York Regent Potatoes, 6*s.*, and Early American, 8*s.* per bushel of 56 lbs., the produce of their prepared Cuttings. Terms cash.

Catalogues with full descriptions on application, Woodlands Nursery, Isleworth.

REDUCED PRICE.

WARD'S OMER PACHA STRAWBERRY.

WILLIAM JAMES WARD respectfully informs his friends and the public that he has still a few well-rooted plants to offer of the above excellent Strawberry, which obtained the Bronze Medal at the Royal Botanic Garden Exhibition, July 5, 1854.

It was submitted for opinion to Mr. Thompson, Horticultural Society, Chiswick; Mr. Marnock, Royal Botanic Gardens, Regent's Park; Mr. Powell, Royal Gardens, Frogmore; Mr. Spencer, Bowood Gardens; and several others: all of whom speak highly favourably of it.

The following extract, accompanied with a woodcut, appeared in the "Florist and Fruitist," September, 1854, in the descriptive list of new Strawberries:—

"OMER PACHA.—This variety is a seedling raised by Mr. Ward from British Queen, fertilised by the old Caroline Pine, two good kinds, of which the present variety seems to be a combination. The samples I received were fine looking fruit, and of good quality."

W. J. W. warrants it of very superior flavour, and well adapted for long carriage.

HORTICULTURAL SOCIETY OF LONDON.—The SECOND SPRING MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, April 3, from 12 to 5 P.M.

HORTICULTURAL SOCIETY OF LONDON.—GARDEN EXHIBITIONS.

Notice is hereby given that the FIRST EXHIBITION of the Season will take place, by permission of her Majesty's Commissioners for the Great Exhibition of 1851, in the GROUNDS of GORE HOUSE, on WEDNESDAY, May 16.

The Garden will be opened to the Public at TWO o'clock, under the following regulations:—All Fellows of the Society will be admitted without tickets, from half-past 12 till 6 o'clock, on signing their names in a book at the entrance. Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society.

All Fellows who shall apply, on or before Monday, the 30th of April, may obtain at the PRIVILEGED RATE of Three Shillings and Sixpence each, any number of tickets NOT EXCEEDING THIRTY-SIX; but no application for such tickets will be received after that day. *Fellows of the Society subscribing for tickets at this price will be allowed a clear week from the 30th of April during which they may claim them.* AFTER THAT PERIOD ALL THE 3*s*. 6*d*. TICKETS SUBSCRIBED FOR, BUT NOT ISSUED, MAY BE CANCELLED. After the 30th of April, any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket.

All applications for tickets must be made at the Society's Office, 21, Regent Street.

NO TICKETS WILL BE ISSUED IN REGENT STREET ON THE DAYS OF EXHIBITION. On those days Offices, near the Garden Entrance, will be opened at half-past 12 o'clock for the issue of tickets at 7*s*. 6*d*. each; but still under the regulations above stated.

SPECIAL PRIVILEGE OF FELLOWS.—Fellows of the Society not only enter free at half-past 12, but can also introduce two friends, WITH TICKETS, at Gore House, Kensington Gore, May 16: at Chiswick, June 20, and July 11. Or the Fellow's power may be transferred to a brother, sister, son, daughter, father, mother, or wife, residing in the Fellow's house, provided the person to whom the transfer is made be furnished with a ticket signed by that Fellow. That is to say, the power of entering early may be transferred, but not the right to FREE admission.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season will take place on WEDNESDAYS, May 9, June 13, and July 4: and of AMERICAN PLANTS, MONDAY, June 18.

Tickets of Admission are now being issued, and may be obtained at the Gardens only, by orders from Fellows or Members of the Society—price on or before May 5, 4*s*.; after that day, 5*s*. each.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

BANKS' SEEDLING FUCHSIAS.—1855.
(FOR FULL DESCRIPTION SEE FORMER ADVERTISEMENTS, AND ON APPLICATION).

W. J. EPPS has much pleasure in stating that the above Fuchsias have been proved to be the finest that have been raised by that celebrated grower E. Banks, Esq., Deal. Early orders are solicited. The set of six, 2*l*. 2*s*. The usual discount to the trade.—Bower Nurseries, Maidstone.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*. Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet: separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. Winstanley, Seedsman, 28, Market Place, Manchester, price 2*s*. 6*d*. per packet: prices to the trade on application.

R. SMITH is now sending out his New Seedling Strawberry, SIR CHARLES NAPIER, the best forcing sort of the day, admired by all who have seen its growth, and for flavour not one to equal it. Price 3*l*. per 100; 50 for 30*s*.; 25 for 17*s*. Also, Sir Charles Napier, British Queen, and Keens' Seedling in pots for Forcing.—R. SMITH, Market Gardener, Richmond Road, Twickenham.

Black Alicant	Chasselas Musqué	West's St. Peter's
Black Tripoli	Muscat of Alexandria	Royal Muscadine
Black Frontignan	Cannon Hall Muscat	August Muscat
	Dutch Hamburgh	Prolific Sweet Water

Nursery, Hammersmith, near London.

CHARLES TURNER begs to intimate that his New SPRING CATALOGUE is now ready, and contains descriptive lists of—

Dahlias,	Carnations,	Scarlet and Horseshoe Geraniums,
Fancy Dahlias,	Picotees,	Delphiniums,
Cinerarias,	Pinks,	Mimulus,
Verbenas,	Pansies,	Pentstemons,
Fuchsias,	Auriculas,	Petunias,
Hollyhocks,	Shrubby Calceolarias,	Bedding Plants, &c.,
Chrysanthemums,		

including several new Dahlias, new Verbenas, new White Bedding Calceolarias, &c., offered for the first time. Can be had on application.—Royal Nursery, Slough.

CHOICE STOCK SEED.—One packet of very choice Scarlet Intermediate, or one of White Emperor Stock, will be forwarded to any one enclosing 12 postage stamps to E. N., Post Office, Louth, Lincolnshire.

IMPORTED GERMAN FLOWER SEEDS.

T. F. WINSTANLEY has received his annual importation (direct from Frankfort) of unrivalled Collections of German Seeds, including Double Ten-Week Stocks, Asters, Zinnia elegans, Truffeaus, new Pæony-flowered Aster, very beautiful, and many other varieties too numerous for insertion. Prices on application; lists free by post.
28, Market Place, Manchester.

COVENT GARDEN.

W. AND S. GAINES beg respectfully to offer to Gardeners, Farmers, and Nurserymen, the following SEEDS:—Scarlet Runners, 27*s*. per bushel; China, Dwarf, or Robbin's Egg Beans, at 28*s*. per bushel. Potatoes for planting; also Annual Flower Seeds, fifteen varieties, 2*s*. 6*d*.; thirty varieties, 5*s*. Prices for cash.—Post-office orders payable to W. & S. GAINES, Charing Cross, London.

HOPS SUPERSEDED BY THE BAVARIAN BITTER, a perfect substitute for Hops, of an agreeable flavour, quite soluble in wort or beer, saving the trouble of straining through a Hop-back, and giving to Beer the well-known keeping properties of the Bavarian Beer. Price of 1 packet, 2*s*. 8*d*., which is equal to 5 lbs. of best Hops.—Prepared only by THOMAS PRATT WILLS, St. George's Square, Portsea. Free per post.

NOTICE TO THE TRADE.

JOHN ADAMS, NURSERYMAN AND SEEDSMAN, High Street, near the Market Place, New Brentford, Middlesex. Nursery Grounds at Acton Green, established several years.

JOHN ADAMS begs to inform his kind friends and patrons that he intends carrying on the above business on a large scale, and begs a continuance of their kind favours, and that nothing on his part shall be wanting to give entire satisfaction.—Brompton Park Nursery, March 24.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBERY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.
"G. B. BAXTER.
"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.
"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,
JOHN SHANKS,
"Forester, Kildrummy Castle.
"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.
"T. AUSTEN, Nurseryman and Seedsman.
"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KENNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

REDUCED PRICE.

WARD'S OMER PACHA STRAWBERRY.

WILLIAM JAMES WARD respectfully informs his friends and the public that he has still a few well-rooted plants to offer of the above excellent Strawberry, which obtained the Bronze Medal at the Royal Botanic Garden Exhibition, July 5, 1854.

It was submitted for opinion to Mr. Thompson, Horticultural Society, Chiswick; Mr. Marnock, Royal Botanic Gardens, Regent's Park; Mr. Powell, Royal Gardens, Frogmore; Mr. Spencer, Bowood Gardens; and several others: all of whom speak highly favourably of it.

The following extract, accompanied with a woodcut, appeared in the "Florist and Fruitist," September, 1854, in the descriptive list of new Strawberries:—

"OMER PACHA.—This variety is a seedling raised by Mr. Ward from British Queen, fertilised by the old Caroline Pine, two good kinds, of which the present variety seems to be a combination. The samples I received were fine looking fruit, and of good quality."

W. J. W. warrants it of very superior flavour, and well adapted for long carriage.

100 Plants	£2 0 0	25 Plants	£0 15 0

FLOWER SEEDS: 50 packets, including the best hardy, half hardy, and tender Annuals and Biennials, with printed instructions, 10*s.* 6*d.*; 25 ditto ditto, 6*s.*; 12 ditto ditto, 3*s.*

GRASS SEEDS: Fine Lawn Grass Seed 1*s.* per lb.: Grass Seeds for laying down permanent pasture mixed to suit any soil, 8*l.* per acre. Every variety of agricultural Seeds of the finest quality. Priced Catalogues may be had on application to W. & G. DAVISON, Seed Warehouse, St. Peter's Street, Hereford.

BASS AND BROWN'S CHOICE VEGETABLE AND FLOWER SEEDS.

For some of the novelties of their first-rate Collections, also choice imported Seeds, Roots for early spring planting, &c., see Advertisements in the Gardeners' Chronicle *of Feb.* 17, *page* 109, *and March* 10, *page* 149.

ASSORTED COLLECTIONS OF VEGETABLE SEEDS, containing the best new sorts

	s.	*d.*
No. 1, with 20 quarts of Peas, and other vegetables in proportion	60	0
No. 2 Collection, 40*s.*; No. 3, 25*s.*; No. 4	15	0

The collections are given in the Seed and Plant List.

FLOWER SEEDS, BEST AND NEWEST ASSORTMENTS, with printed instructions for sowing, &c.

100 vars., choice strong annuals...	15	0
50 vars., 5*s.* 6*d.*; 30 vars., 5*s.* 6*d.*; 20 vars.	4	0
20 vars. best dwarf kinds, in large packets, suited for beds on lawns, 7*s.* 6*d.*; 12 vars....	5	0
20 vars. choice greenhouse annuals, 7*s.* 6*d.*; 12 vars. ...	5	0
20 vars. choice greenhouse perennials, 10*s.* 6*d.*; 12 vars....	7	6
20 vars. choice hardy biennials and perennials	7	6
12 do. do do do.	5	0

For further particulars see Seed and Plant List.

CHOICE IMPORTED SEEDS, comprising Stock, Aster, Balsam, Cockscomb, Larkspur, Salpiglossis, Scabious, Sinecia, Sweet William, Wallflower, Zinnia, &c.

BASS & BROWN'S Seed and Plant List free by post for three penny stamps. Also the autumn Catalogue for three penny stamps; or gratis to our customers who may not have received them.—Seed and Horticultural Establishment, Sudbury, Suffolk.

R. PARKER begs to offer the following, all of which are well established, and can be forwarded to any part of the Kingdom:—

	From per dozen.—*s.*	*d.*
Exotic Orchids, distinct and beautiful species	60	0
Exotic Ferns „ „	18	0
British ditto „ „	9	0
Exotic Lycopodiums „ „	12	0
Roses, consisting of the best varieties of Hybrid Perpetuals, Teas, and Bourbons, strong plants, established in pots ...	12	0
Cinerarias, choice named varieties, strong, established plants, in 4-inch pots	9	0
Cinerarias (Seedlings), from the finest named varieties, including the best varieties sent out last season, strong, established plants, in 4-inch pots	4	0
Calceolarias (Seedlings), from beautiful spotted varieties, strong, established plants	6	0

Lists of Names forwarded upon application.

The following choice Cucumbers and Melons, in packets of 12 Seeds, at 1*s.* per packet:—

CUCUMBERS.	MELONS.
Superlative Improved	Golden Perfection (extra fine)
Walker's Rambler	Bromham Hall
Manchester Prize	Persian Green Flesh
Hunter's Prolific	Chichester Prize
Improved Patrick.	Cuthill's Scarlet Flesh.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Holloway.

NEW SEEDS, CARRIAGE FREE.

	Per lb.—*s.*	*d.*
White Belgian Carrot	2	0
Yellow Globe Mangold Wurzel	1	0
Morton's Yellow Globe do....	1	6
Fisher Hobbs' Yellow Globe do.	1	6
Elvetham Long Red do.	2	0
True Devon Evergreen Grass ... ... 5*s.* to	6	0
Imported Italian Rye-grass ... ... 8*s.* to	7	0
Dickenson's Improved do.	8	0
True Somerset Cow Grass ... ... 9*d.*, 10*d.*, to	1	0

Common Red Clover... ... ... 6*d.*, 7*d.* to	0	8
White Dutch do. ... ... 9*d.*, 10*d.*, to	1	0

Prices of all kinds of Agricultural Seeds will be found in RENDLE'S "Farming Price Current and Garden Directory," just published.—Apply to

WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out the following New Plants on the 30th April next:—

HYDRANGEA HORTENSIS, flore pleno, 10*s.* 6*d.*

PHLOX QUEEN VICTORIA, 5*s.*

DAHLIA EMPEROR FRANCIS JOSEPH (variegated foliage), 10*s.* 6*d.*

SHRUBBY BEDDING CALCEOLARIAS.

Brunette	7*s.* 6*d.*	Norma	7*s.* 6*d.*
Coreggio	7 6	Red Rover	7 6
Maggiore	7 6	Vezzosa	7 6
Minnie...	7 6	Wildfire	7 6

Or the set of eight varieties, 2*l.* 2*s.*

With the permission of Mr. C. Turner they will offer his new CALCEOLARIA PURITY (the best white bedding variety) at 7*s.* 6*d.* each, or with the above set 2*l.* 7*s.*

FUCHSIAS.

Queen Victoria (Story)	10*s.* 6*d.*	Lady of the Lake (Story)	10*s.* 6*d.*
Prince Albert (Banks) ...	10 6	Water Nymph (Story) ...	10 6
Perrugino (Story)	10 6	Raffaelle (Story)	10 6
Empress Eugenie (Story)	10 6	Mrs. Story (Story)	10 6
Ranunculæflora (Story)...	21 0	Snowdrop (Story)	10 6

Or the set of ten varieties, 4*l.* 4*s.*

FUCHSIA BANKS' FAVOURITE (Banks), 10*s.* 6*d.*

For full particulars of the above see back numbers of this Paper.—March 24.

UNRIVALLED SPECIMENS OF HARDY ORNAMENTAL TREES, SHRUBS, CONIFERÆ, ETC.

LUCOMBE, PINCE, AND CO. respectfully call attention to their superior stock of the above, which is worthy of the notice of those who are engaged in Ornamental Planting, where immediate effect combined with perfect safety in removal is an important consideration.

L., P. & Co. refer with much satisfaction to the great success with which they have for many years been in the habit of removing their large and symmetrically grown specimens (even to very great distances), facts which fully justify them in stating that such Plants as they now offer are seldom to be met with. Their stock is too extensive for the limits of an Advertisement, a few only of the more prominent ones being here named, but sizes, prices, and full particulars of all may be had on application.

Arbutus, of sorts	Pinus cembra
Abies Douglasi	„ excelsa
„ orientalis	Picea Nordmanniana
„ Menziesi	„ Pinsapo
„ canadensis	Portugal Laurels, *fine large, bushy*
Araucaria imbricata	Purple Beech
Biota glauca	Irish Yews
„ japonica	Ilex Oak
Birch, silver stemmed	Japan Yews
Cedars of Lebanon	Juniperus excelsa
Cedrus deodara	Libocedrus chilensis
Cupressus macrocarpa	Scarlet Oaks
Ford's Oaks	Rhododendrons, *fine large, bushy, grown in loam, fit for any soil or situation*
Laurels, *fine large, bushy*	Standard Bays, *in tubs*
Lucombe Oaks	„ Portugal Laurel
Magnolias	„ Standard Thorns
Pampas Grass	&c. &c. &c.
Pinus insignis	
„ austriaca	

Exeter Nursery, Exeter.—Established 1720.

FISHER, HOLMES, AND CO. beg to offer the following, all of which are good sized healthy plants, such as they feel assured cannot fail to give satisfaction:—

	Each—*s.*	*d.*		Each—*s.*	*d.*
Begonia Prestoniensis ...	1	0	Eranthemum leuconervum	1	0
Æschinanthus splendidus	1	6	Cantua dependens ...	0	9
Rogeria amœna	1	6	„ bicolor	0	9
Hoya bella	1	0	Mitraria coccinea ...	0	9
„ campanulata ...	1	6	Lycopodium umbrosum ...	1	0
Allamanda neriifolia ...	1	6	„ viticulosum ...	1	0
Ixora coccinea	1	6	„ apothecum ...	1	0
„ „ smaller ...	1	0	„ lousianum ...	1	0
Burchellia capensis ...	1	6	„ Poppigianum	1	0
Franciscea contertifolia, flowering plants 1*s.* 6*d.* to	2	6	„ cæsium arboreum	1	0
Cypripedium insigne ...	2	6	Doodia aspera	1	0
Henfreya scandens ...	1	0	Humea elegans, strong, for flowering this season, 1*s.* to	1	6
Justicia coccinea	1	6	Fuchsia Duke of Wellington	0	9
Hexacentris myosoriensis	1	6	White Fairy Rose ...	0	6

The following smaller but nice established plants:—

Cyrtoceras reflexa ...	1	6	Hoya picta ...	2	6
Pentas rosea	1	0	Tacsonia molissima ...	1	0
			Yucca aloefolia	1	6

Azalea indica Apollo, Amabilis, Aurantia superbe, Decora, Duke of Wellington, double white, Extrani, formosa, Frosti, fulgens, Gem, Glory of Sunning Hill, Hebe, Ignescens, Lucombe majesta, Murrayana, Optima, Prima Donna, refulgens, and splendens. The above 1*s.* to 1*s.* 6*d.* each, all strong healthy bushy plants. Remittances from unknown correspondents will oblige.

Handsworth Nursery, Sheffield, March 21.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A. ROSES; B. ORNAMENTAL TREES AND CONIFERS; C. FRUIT TREES; D. HERBACEOUS PLANTS; F. GREENHOUSE PLANTS, &c.; G. SEEDS; H. HOLLYHOCKS; I. BULBS.—Nurseries, Cheshunt, Herts.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

GEORGE SMITH'S PRICED AND DESCRIPTIVE CATALOGUE of first-class Verbenas, Fuchsias, Geraniums (Show, Fancy, Variegated, and Scarlet), Dahlias, Chrysanthemums, splendid new Hollyhocks, very choice Petunias, &c., will be forwarded in return for one postage stamp.

The Geraniums are in extra fine condition, and require repotting. Parties giving orders immediately will save much in carriage, with less liability to damage by having them before they are repotted. Choice Verbena Seed from the finest show flowers.—Tollington Nursery, Hornsey Road, Islington, London.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

NEW BEDDING CALCEOLARIAS.

MESSRS. WILLIAM ROLLISSON AND SONS beg to announce that they have purchased the entire stock from Mr. Cole of the undermentioned Gems, and will commence sending them out the first week in May.

CALCEOLARIA VARIABILIS, 10*s.* 6*d.* each.—As a bedding plant this will make a charming variety, and in some measure supply the deficiency there has been for durable and effective plants of a light colour for the parterre. It is an excellent grower of very compact, pretty habit, and produces in great profusion immense trusses of blossom, which open of a delicate primrose colour, and change to white. Altogether it is a most desirable acquisition, and a variety thoroughly distinct to any in cultivation.

CALCEOLARIA ECLIPSE, 10*s.* 6*d.* each.—This is the most showy and brilliant coloured variety ever raised, of nice compact habit, producing large trusses of glowing crimson flowers, which are somewhat remarkable for the length of time they last in blossom; as a bedding plant its value will be inestimable. It was awarded a first class certificate by the National Floricultural Society, June 15, 1854, also at the Royal Botanic Gardens, July 5, 1854, and has been repeatedly noticed in the *Gardeners' Chronicle* for its good qualities and matchless colour.

The above two Calceolarias produce such magnificent trusses of blossom, and are so extremely effective, that they will be admirably adapted for Greenhouse and Conservatory decoration.

Messrs. W. R. & Sons have an excellent stock of Rollisson's Unique Geranium, which can be supplied at 5*l.* per 100. Although not new, this is a very useful and showy plant for bedding and general decorative purposes.

Messrs. William Rollisson & Sons beg to draw attention to their extensive Collection of Specimen and Half-specimen Orchids, Ericas, Azaleas, Stove and Greenhouse Plants, &c. &c., which are this season in unusually fine condition.

The Nurseries, Tooting, near London.

GRASS SEEDS, CLOVERS, ETC.

T. F. WINSTANLEY is now ready to send out his Mixture of New Grass Seeds, for Laying down New or for Renovating Old Pasture; finest Mixtures for Lawns, &c. For list of sorts and quantities, &c., see his Garden and Agricultural Seed List, to be had on application.

28, Market Place, Manchester.

NEW EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, beg to intimate to their friends that they ARE NOW prepared to send out AT ONCE good strong plants of WILLIAMS' EVERGREEN CLIMBING ROSE, at 3*s.* 6*d.* each, with the usual allowance to the trade, and a still further reduction if one dozen or more are ordered at once. Price may be had on application.

N.B.—Single Plants will be sent free per post on receipt of six penny postage stamps EXTRA to defray postage. Strong Plants of the above may also be obtained at the same price from Mr. CHARLES TURNER, of the Royal Nursery, Slough.

The Gardeners' Chronicle.

SATURDAY, MARCH 24, 1855.

IT is to be feared that TEMPERING STEEL will soon become one of the lost arts, unless our cutlers bestir themselves to some purpose. Witnesses before the Crimean Committee of inquiry declare that the English hardware supplied to the Ordnance is of the vilest quality; that the picks won't pick, nor the bill-hooks cut, nor the trenching tools break up earth; that hence we can neither mine, nor throw up field works, nor even grub up roots for fuel. Cavalry officers say that their men's swords are incapable of piercing a Russian jacket, and that for an English soldier to strike a blow is only to disarm himself. In short, steel is becoming an unknown material, and the present age seems likely to be called by future historians neither that of iron nor of bronze, but of LEAD and BRASS. We trust the admirers of routine will not regard the last remark as being personal.

It is no business of ours, indeed, to complain of swords and military tools. Nor should we do so if the public service were all that suffered: for there are men enough now, active, intelligent, and resolute, to look after that. Our grievance is purely horticultural. We complain that gardeners are treated as badly as troops, and that they can nowhere procure the instruments peculiar to their calling. The only

cutting instrument, the use of which is limited to gardeners, is the pruning knife; and that they cannot buy. To be sure we see in every cutler's or even ironmonger's shop, things called pruning knives; heavy, awkward, ill-contrived pieces of iron, admirably suited for bending or snapping or conversion into primitive saws, after half a day's pruning; but if we ask for a pruning knife that will prune no such article can be found.

Seriously speaking this is not only a great evil, but indicates a state of trade discreditable to the cutlers of this country. It is also quite a modern condition of things. A few years ago every nurseryman could supply his customers with knives that were faultless and at a price within the means of those who had to use them. Now it is so far otherwise that people to whom a good knife is of the first necessity may travel from Exeter to Inverness without finding such a thing. We do not mean that no good knives are procurable for money; doubtless the great cutlers will supply you with a perfect instrument if you will pay an exorbitant price for it: but what is wanted by the public is as good a knife as was made 30 years ago at the same price as was then demanded. That we cannot have; or at least we are wholly unable to discover its whereabouts. In the days of the late Lord Vernon there was a capital maker at Derby, one of whose knives now before us is still fit for excellent service, although it has been but indifferently treated for a dozen years. If that maker still exists he may bring the horticultural world to his shop, provided he has not lost his art or unreasonably raised his price.

A pruning-knife should be light, not too thick at the back, forming two gentle curves at the back and edge, and with a handle rough enough and long enough to enable the operator to have a firm grasp. The hook-pointed knives now so common are very objectionable. In temper it should be tough, and so hard as to keep a keen edge, with no more trouble in sharpening than is demanded by a good chisel. If too hard it breaks at the edge, or snaps short near the neck or middle of the blade. In price it ought to be sold retail for 1*s.* 6*d.* or 2*s.* If a clasp knife it would we suppose be worth something more: but a true gardener is content with a fixed blade in the old fashioned paper sheath, or "shade," as it used to be called. If fine gentlemen earning 12*s.* a week think it vulgar to wear such a knife in a slit on the right hand of the trousers, as their fathers did, they will of course not object to paying the price of being genteel and set themselves up with a "clasp." Can no one induce some skilful artizan to turn his attention to this subject? or must we go to the United States or Canada for our pruning knives as well as our axes?

No principle is more generally recognised in the treatment of human maladies, though few perhaps are less attended to by the majority, of every grade of education and indeed of natural intelligence in other matters, than the necessity of ascertaining accurately the nature of any affection before an attempt is made to apply a remedy. Where a contrary practice is adopted, people must be prepared to run all the risks that wait upon empiricism, and much more if they are not content to let well alone, but will be using all sorts of nostrums, where there is scarcely a trace of disorder. These remarks are quite as applicable to horticultural pursuits as they are to other cases in which men are victimised by the bold assertions of empirics. It is, in fact, a far more easy matter to use a dozen different remedies than it is to ascertain with precision the disease to which those remedies are applied, or the cause from which it springs. A case has just been submitted to us respecting a disease the history of which is pretty well ascertained, and for which there is a certain remedy, as may be ascertained with ease by any one who will take the pains to look over the indices of our last two or three volumes, without having recourse to any anti-blight composition, however highly it may be vaunted.

The Grape blight is by no means difficult to recognise, even without a microscope, by its mealy aspect, which is totally different from any other affection, and precisely similar in appearance to the mildew of Roses, Hawthorn, Peaches, &c., with which every cultivator must of necessity be acquainted, and if other affections of a totally different nature, as rust, chlorosis, spotting, &c., be mistaken for it, the use of the best remedies for Grape mildew, which are totally inapplicable in the other cases, can only end in disappointment. It is well always to have wholesome suspicions of remedies which promise too much, and though it is just possible that some fiftieth remedy, after 49 unsuccessful recommendations, may take effect, there is a fearful risk on the other hand of aggravating the malady by such chance and aimless attempts. If chemical compositions be applied with a syringe in cases where there is no peculiar diseased action to neutralise or decompose the matter applied, it will form a permanent pellicle upon the plant, and like the carbonate of lime which is in some districts so copiously deposited from the water, will soon act as a mechanical obstacle to the due respiration and perspiration of the leaves, and in consequence induce serious malady.

When the tissues of plants themselves are in the first instance affected, it is often difficult to ascertain the cause, but every gardener who wishes to take an eminent position in his profession must make himself master, at least, of all external affections. There is, in fact, no excuse for him, if he is not able to combat such attacks where the remedy is in daily use amongst the more intelligent. *M. J. B.*

At the close of the article in the *Gardeners' Chronicle* of the 10th inst., on M. Godron's Experiments on Ægilops, we observed that neither he nor M. Jordan, who has filled 100 pages of the "Memoirs of the Academy of Lyons" with speculations upon the origin of domesticated plants, have attempted to explain what the origin of Wheat has been, if it is not a domesticated condition of Ægilops. We find that we overlooked a passage in this lengthy paper in which he does make the attempt, but in a manner so new and original that it is not worth referring to it, even as an instance of the absurdities into which we are led by the modern theory, that all varieties or races of plants of any degree of permanency are true species. This doctrine, which threatens to plunge the science of botany into inextricable chaos, would scarcely be deserving of serious refutation were it not that its advocates are daily increasing in number, especially on the Continent, and they seem generally to recognise M. Jordan as an able and talented expounder of their views.

We have not access just now to the "Lyons Transactions," but in a detailed abstract in Schlechtendahl's "Botanische Zeitung" we find the following passage:—"If, therefore, all these supposed races of our domesticated plants are true species, how can we explain the fact of their being in cultivation, unless we assume that they either do now or did once exist on our globe in a wild state? But they are now nowhere to be found. From historical traditions we know that almost all our fruit trees, vegetables, and cerealia came to Europe from the temperate regions of Asia. Their cultivation in Asia appears to date from the remotest antiquity. Asia must, therefore, have been the country where they once grew wild, but are now no more to be found in that state. The same uncertainty prevails with regard to many domesticated animals. It appears, therefore, that these plants and animals are in direct connection with the origin of mankind. In the Bible we read that a fearful catastrophe once overwhelmed the earth — the Deluge—on which occasion only a small number of persons, with the animals and plants which they especially required for their support, were saved. It must be supposed that they also saved with them seeds of various plants which they sowed again on the subsidence of the flood. In this way the domesticated plants disappeared in their wild state, and only remained as cultivated. Thus, therefore, is the Biblical narrative confirmed by science, as the phenomena can only be explained in this way."

But not only are we unable to recall any passage in the Mosaic account of the Deluge in support of the gratuitous supposition that the waters destroyed vegetable as well as animal life, or that Noah laid in a stock of seeds to restore vegetation on the face of the earth, but we actually find that the Olive-tree at least was not destroyed, for the first evidence Noah had of the abatement of the waters was the return of the dove with "an Olive-leaf pluckt off" in her mouth. Moreover, does M. Jordan suppose that the Deluge destroyed only the wild originals of domesticated plants, or the entire vegetation? and, in the latter case, did Noah carry with him into the ark seeds of one or two hundred thousand species (or, if we adopt M. Jordan's views, one or two million species) in order to replenish the earth after the flood was over? We think that either he or his disciples should answer that inquiry before they carry their speculations any further.

VEGETABLE PATHOLOGY.—No. LXIV.

286. Apostaxis. *Constitutional or Accidental.* Discharge of Starch.—Amongst the collections made by Lieut.-Colonel Sir T. L. Mitchell in sub-tropical Australia, No. 471 is a most curious and beautiful production, which appears to have oozed from the upper and under surface of the leaves of some species of Eucalyptus. The substance consists of flabelliform flakes, marked occasionally with a few concentric zones, indicative of interruptions in the process of formation, and most beautifully and regularly fissured, often subdichotomously, in a radiating direction from the wedge-shaped base. Under the microscope it has a glistening aspect, and presents an appearance not unlike that of some thin sponge, in consequence of the frequent lacunæ and spiculæform processes which connect the linear bodies into which the mass is divided. In some cases also the lamina is not simple, but is composed of two or more distinct layers. The whole substance appears to consist of starch, for on the application of an aqueous solution of iodine it assumes the most beautiful blue, and on the addition of a drop of sulphuric acid gradually dissolves, assuming a reddish tint. The columnar structure, if so it may be called, resembles very closely that of the curious formation of ice on the stems of certain plants, which was lately described in the *Gardeners' Chronicle* (1854, page 740), from a paper by Dr. Caspary, and may perhaps be compared with the sort of spurious crystallisation which takes place in Wheat starch, as prepared for commerce, though the condition of the two is totally different. The quantity produced on the single leaf in my possession, for which I am indebted to the kindness of Dr. Lindley, is considerable, and must be highly injurious to the tree, and a very curious chemical condition must have existed in the plant to cause the amylaceous matter to flow out in such a form. It is very probably in a state of transition into dextrine, a transformation which is very frequent during the process of vegetation. Under the teeth it has a harsh consistence, something like that of the slices of pith known under the name of Rice Paper, but it is evidently no form of cellulose, as it at once assumes a fine blue with iodine, without the admixture of any sulphuric acid. I have in vain searched for any notice of a similar phenomenon, and regret that I am not able to do the subject more ample justice, both from want of materials and deficiency of chemical knowledge.*

287. Starch granules are sometimes ejected bodily from the cells of plants, without any transformation. During the prevalence of the Potato disease, it was not uncommon to find tubers which were studded with little glistening white patches, consisting entirely of starch grains. When it is considered that there are not only many layers of muriform cells immediately beneath the cuticle, but that the first layers which follow are deficient in starch granules, it is evident that a considerable organic lesion must take place before the grains themselves can be ejected, and at the same time there must be a great pressure on the walls of the cells themselves. These heaps of starch granules are not to be confounded with the curious appearance described in this Journal 1848, p. 555. The white granules of which the little heaps consisted in that case, instead of becoming blue with iodine, assumed a brown tint. They were, in fact, oblong cells adhering very loosely to each other, and were evidently of the same nature as the ordinary cells of the tubers, as they assumed, when exposed to light and air, the cinnamon tint which is usual to the tissue under similar circumstances. The cuticle was split into irregular stars, in order to make way for them, and when washed out they left pits similar to those which are produced by the scab. I have not myself had an opportunity of examining this disease, which has many points about it of considerable interest. The figure is here reproduced in order to draw attention once more to the subject.

288. Oliviline, which is associated by Dr. Thomson with amylaceous matters, is discharged with the gum of the Olive tree. The most recent chemists consider its nature as doubtful, and its occurrence is, therefore, simply mentioned in this place. *M. J. B.*

ENTOMOLOGY.

THE BRITISH INK GALL.

It was the opinion of a fanciful naturalist who lately occupied the chair of Natural History in one of our Universities, that the peculiar forms of galls upon different trees and plants were owing to the natural tendency of the sap of those plants to develop forms analogous to those of the galls in question;—thus the natural tendency of the sap of the Rose tree is to form pricklets, and consequently the galls of the Rose tree, commonly called Moss balls or bedeguars, are all over studded with weak pricklets. This pretty theory might be difficult to overthrow if it happened that each plant produced only one kind of gall, but as the same kind of tree, especially the Oak, bears a great number of distinct species of galls, each of a distinct form from the rest, it becomes at once evident that some other influence is in operation besides "the natural tendency of the sap."

Now nothing is more remarkable in the physiology of plants, as well as of insects, than that two kinds of flies, so nearly resembling each other in size, form, and colour as to be scarcely distinguished even with a lens, should by puncturing the leaf or stem of a plant produce two totally different galls, varying not only in size and colour

* It is just possible that the production may be the work of an insect; but if so, it must still be formed at the expense of the amylaceous matter in the plant, for I know of no instance of an animal secreting starch, though there is more than one case on record of the presence of cellulose in their organisms.

but also in texture, one being soft and fleshy, whilst another is hard as wood itself.

The common Oak, as above noticed, is especially prolific in producing a great number of distinct species of galls, the leaves, the catkins, the stem, the twigs, and even the root being infested with these excrescences, caused by the punctures of Cynips Quercus folii, C. Quercus baccarum, C. Quercus inferus, C. Quercus pedunculi, C. Quercus corticis, C. Quercus Ramuli, C. Quercus Gemmæ, C. Quercus terminalis, C. Quercus petioli, all described by Linnæus and Fabricius, besides a considerable number of new species, lately monographed by Hartig, who appears to have described the species which produces the gall figured in the *Gardeners' Chronicle* (ante p. 116, under the name of the Chesnut-fruited Oak gall) as the Cynips caput Medusæ.

These various galls and their inhabitants form an interesting subject of investigation, possessing, as they do, many curious points of inquiry, unattended however by any other practical results than may be produced from the injury, slight indeed as it appears to be, which the trees may receive from the distraction from their ordinary course of the nutritive fluids, although in the case of the Pear tree infested by aphis galls described by me in the *Gard. Chron.* for 1849, p. 755, a positive injury was produced. There is, however, one species of Oak-gall fly of great importance in a practical and even commercial point of view, which will form the subject of our next Entomological paper, namely, the Ink gall fly, Cynips Quercus tinctoria (C. scriptorum, of Kirby and Spence) the galls of which, under the name of Nut galls, are imported in great numbers for the manufacture of ink.

It might be a question worthy of some examination whether some of the kinds of Oak galls which occur in great numbers in this country might not be beneficially collected with the view of making use of the great quantity of tannin which they unquestionably contain. This might be done with the marble-like globular gall of Oak leaves, C. Q. folii, and especially with the Oak

Apples, so well known to every country schoolboy who strives to climb and get one to stick in his hat on King Charles's day.

Be this as it may, the species of gall, represented in the accompanying figure, possesses properties entirely similar to those of the Nut gall of commerce, and having been collected in considerable numbers in Devonshire, has been successfully applied in the manufacture of ink. At the last December meeting of the Entomological Society, Mr. Stainton read the following extract from a letter received from R. C. R. Gordon, Esq., of Queen's College, Birmingham, relative to this species of gall, which had been exhibited at a previous meeting by Mr. Rich. "The galls are old friends of mine; I have known them for 20 years; of late they have been more common. I have here some specimens of the Cynips—I have known the Cynips for three years. About five years ago a medical man at Lympstone, near Exmouth, used them always to make his ink and tried to impress upon the country people the use that might spring from making them an article, so to speak, of exportation. But of course, as with all other things of this sort, they would rather gather the galls for him to make the ink, when paid for it, but never made any attempt to sell them elsewhere. They would be a good substitute for the Nut galls, and deserve to be used instead. The Cynips appears in September, perforating the gall by a single round hole. The galls themselves are first green, afterwards brown; the larvæ may be occasionally found in them in spring."

Mr. Rich had obtained these galls from Somersetshire and part of Gloucestershire, where they were so abundant that the Oaks were covered with them to the extinction of the acorns, the loss of which for feeding their pigs the farmers greatly regretted, thus raising another economical question connected with the subject of these galls of considerable interest, bearing likewise, as it does, on the physiology of the plant, since the galls are developed in the axils of the leaves, and prevent the development of the acorns, of which they usurp the place. The species is figured, with considerable details, by Rosel (Ins. Belust. Supp. Vesp. Gall Quern., tab. 35 and 36), under the name of C. Quercus petioli, with a reference to Fabricius Sp. Ins., No. 6; but the insect had been previously described by Linnæus, Geoffroy, and Reaumur, the last-named author representing it in his Mémoires, iii. pl. 41, on which also are represented the Cherry-like galls of C. Quercus terminalis, which may possibly be a variety of the same kind of gall developed singly at the end of a twig. In this view I gave the latter name to the gall now before us some time since in reply to one of my correspondents.

Mr. Stainton's correspondent informs us, moreover, that it is chiefly upon the lower twigs of Oaks, in hedges which have been cut down three or four years previously, that the galls are most numerous, being rarely found higher than 10 feet above the surface of the ground, so that it would not be difficult to collect them, and that the appearance of the trees now denuded of leaves is rendered quite remarkable by their great number. Rendered thus conspicuous, they become the objects of attack to the titmice, which, notwithstanding the smooth hard surface of the galls, contrive to make a hole in them to pick out the larvæ which remain in them unchanged during the winter.

As the species is very closely allied to that which forms the Oak galls of commerce, we shall defer the specific description of the present species for our next article, in order to point out the distinctions between them by a comparative diagnosis. *J. O. W.*

CLIMATES OF FOREIGN COUNTRIES.—No. V.

Nice, *March* 9, 1855.—Though the winter here has been unusually cold, Violets, both single and double, are now in abundance. Wallflowers are in blossom, the single bright yellow (Cheiranthus Cheiri) growing wild on the rocks. The Almond trees have gone off bloom, and are succeeded by standard Peaches, which are very showy, and also Apricots. Scarlet Geraniums in the ground, which were cut by the frost, are making fresh shoots. Stocks of various colours, single and double, are large and handsome: the Jardin des Plantes, near the sea, is quite gay with them and Wallflowers, mixed with Venus's Looking Glass, now also in full bloom, with hedge-rows of yellow Coronilla. The corn fields are in many places literally covered with the single blue and scarlet Anemones.

It should be observed that each of the principal wild flowers has its own locality; for instance, Primroses are only met with in quantity by the "Vallon obscur," Crocuses on "Mont Vinaigrier," Blue Hepaticas in the valley of that name, Snowdrops on "Mont Gros," &c. The pretty Grape Hyacinth (Muscari racemosum) is almost everywhere to be met with, and a species of Rhus, with scarlet berries, is found in many places on the rocks, as is also the little blue Harebell (Campanula rotundifolia) and the pretty delicate lilac Lavatera maritima in some districts; likewise various sorts of Orchis.

The markets are now well supplied with vegetables, Broccoli being in full season, and Cauliflowers plentiful. New Potatoes are about 2*d.* per lb. English. There is also a small yellow sort sold here called Pommes de Terre Chataigne. Salmon and Turnip Radishes have continued throughout the winter in the open ground, and are now quite common; also young Carrots and Onions, Lettuces, Spinach, and Endive.

As to the temperature, fires indoors are nearly done with, and the power of the sun is almost too much for walking out in the middle of the day unless by the sea, from which there is a refreshing breeze. A comparison of the average temperature of Nice and London for the half months as under gives the following result:—

	Nice.	London.	Excess, Nice.

COMMON THINGS.

Asparagus.—There are various methods pursued in forming new plantations of Asparagus. The most common one is to trench the ground from 2 to 3 feet deep, mixing with the soil a good quantity of rotten dung. If the soil be good to the depth of 3 feet, it will not be necessary under the ordinary culture to prepare the ground deeper, but in doing this a large portion of manure is necessary, and it will be requisite that it should be regularly mixed with the soil from the bottom of the trench to the top. If one of the quarters of the garden should be required for Asparagus alone the whole ought to be trenched and manured as if it were for only one single bed, as the roots spread themselves in all directions, and by penetrating the alleys between the beds the outer rows of heads will always be finer than those in the middle. The ground being prepared the beds should be set out the width of 5 feet, with 3 feet alleys, fixing a strong stake at the corners of each bed, driven down to the depth of 3 feet. About the present season proceed thus to plant the beds: strain a line round the four corners of the first bed, cut it down perpendicularly on the inside of the line to the depth of 3 inches, and take out the soil, which must be laid on the alleys on each side, levelling the surface perfectly even, but take care not to stand upon the bed, on the contrary keep the soil as light as possible; mark out four lines at a foot from each side of the bed and a foot from each other; measure a foot from the end of the bed, and mark each a line at a foot apart, thus forming squares of 12 inches each way. Being now provided with some good one or two-year old plants (not more), open the roots flat, place one plant on each of those places marked on the lines, and fasten it down with a handful of mould to keep it in its place. When this is done the bed must be filled up level with the spade. This being finished, proceed with the other beds in like manner till the whole is completed.

Artichokes are propagated by the off-set suckers, which are produced abundantly from the roots of old plants: these should be planted in rows 4 feet apart, placing them in clumps of three or four in each, 2 feet asunder in the rows. Artichokes require a deep soil; and before they are planted the ground should be well manured, and trenched 2 feet deep: this operation should be performed in April as soon as the young leaves begin to show themselves above the surface of the ground. After this, the plants will require only to be kept clear from weeds during the summer; and in the autumn to be protected by litter from the stable, to secure them against frosts in winter.

SPRING PROTECTIONS.

Having accidentally in my possession six large canvas blinds mounted on strong rollers, I am fixing them in front of my Peach trees, as a protection against the frost, by a movable contrivance, of which the annexed is a sketch. They seem likely to work

so well that I am induced to send you this communication. I think the representation will tell its own tale. The bar across the top is driven down till it is quite tight; and as a precaution a nail may be lightly tacked in at each end, to prevent its getting loose. By putting another small staple for the gudgeon to run it under that shown in the drawing, another blind can be fixed on the other side, so that six blinds can be slung by seven of the fastenings. *C. W. M.*

Home Correspondence.

The Crimea, its Climate and Vegetation.—I am much interested by the account of Koch's work on the Crimea, noticed by you at p. 171. I have one or two observation to make on it. Not having yet seen his work I do not know whether he explains the present desolation of the Crimea, which is naturally a fertile country, with a fair middle European climate more like that of the Pyrenees or Lombardy than anything else I could compare it with. Remember that what there is of really Mediterranean vegetation, whether native or cultivated, is confined to the valleys of the southern coast—the plains or undulating country to the north being rather in the same condition, as to climate and Flora, as southern Hungary and Wallachia and Moldavia, which have a soil and physical status very like the great steppe of the Crimea. The Russians, as Clarke tells us, depopulated and destroyed the previous cultivation of the Crimea, and their system of government has continued or increased the state of desolation, to which it was reduced after their conquest of it. The steppe north of Perekop to the Dnieper, and a small part of that south of Perekop, are a dreadful saline desert. They are, as well as much of the coast of the peninsula and other parts of the shore of the Euxine, the ancient bed of a shallow sea (which once, in all probability, extended through the trough of the Manytch into the Caspian basin, and perhaps far beyond it), the sudden drying up or running off of which is alluded to in one or two passages of Pliny, apparently as a tra-

dition generally received in his time. This tract is indeed sterile; the surface little above the present level of the sea, the soil full of salt, showing no traces of hill or valley or running water—few wells—but hillocks of sand irregularly alternating with saline mud or marsh, in which the vegetation is all Salsola, Salicornia, Anabasis, Statice, and other salt plants, with abundance of Artemisia. The limit of this saline steppe, or ancient strait, is bold and well defined to the northward by the tertiary cliffs and hills of the right bank of the Dnieper, and of the high tertiary and granitic steppe which extends from that river near Bereslap above Cherson, to the sea of Azof near Mariupol. The southern limit of this low salt steppe within the peninsula of the Crimea, and south of Perekop, is not so well defined—the rise being gradual, and the change marked chiefly by the improvement of soil and vegetation. But all that central plain or low tertiary plateau is intersected by valleys, watered by fresh, if not copious, streamlets, and is in every respect equal to those similar high steppes of Southern Russia north of the low saline strait, with the advantage of a decidedly better, though still variable, climate. Were justice done to this district, it would probable become a fine corn country, but its masters must change or be changed before that is likely to happen. The natives are docile enough. Picturesque palaces, and marine villas of nobles, belonging to St. Petersburgh and Moscow, will not make up for the depopulation of a large province turned into a vast military position. On the limestone steppes or plateau, the most conspicuous among the Burian, or weeds, is the wild Hollyhock, Alcea ficifolia, the colour in the wild plant being invariably the sulphur yellow, and very handsome. Another striking plant, particularly so in the droughts of summer, is the Liquorice, Glycyrrhiza glabra, forming large patches of dark and seemingly indestructible green, which resists the strongest heats of summer and autumn, while everything is parched around it. It seems to flower but sparingly, even in a state of nature. Some of the coarse biennial or perennial Centaureas considered as flowering bushes, C. ovina, &c., are not ugly when in bloom. As to Koch's Quercus pubescens, it seemed to me the same as that which I saw some months later on the hills around the plain of Troy, growing with the Valonia Oak. I suppose it to be the same as that of Southern Austria and probably Hungary, which is not seen in Western Germany, except in a few pleasure grounds, as an ornamental grey tree. Juniperus rufescens seems very near J. macrocarpa of Greece and Naples—very near J. oxycedrus—which might easily extend to the Crimea. It seems everywhere to prefer sea shores. I am interested in the question of the identity of the J. excelsa with ours, or that of Nepal and Siberia. In some botanical works, every species from Russia which is not known to be European, and some European ones too, are set down as Siberian. Koch's description is exact. The words in italics in your quotation only need the omission of the last comma, and perhaps the transposition of the word "have" to be quite correct as a translation from what I conceive the original German, from its sense, to be. Just imagine the Isle of Wight on a larger scale, the Southampton water suddenly run dry by a submarine earthquake in the Atlantic (the Straits of Dover being not yet cut through the chalk), the water in the Solent and Spithead lowered so as to leave a spit of sand for an isthmus partly covered with brackish pools and salt marshes, and uniting the low shore of West Cowes with the nearest point of the then dry bed of the previous Southampton Waters, and you have a good idea of the geography of the Crimea—its tertiary plateau being further represented by the tertiary country about Newport; the Medina might be the Salghir, and the chalk and subjacent secondary strata very truly and correctly figuring the limestone rocks of a similar formation in the Yaila range, with a warm sunny under cliff of older beds, in both peninsulas, cropping out from below. *S.*

Under-ground Manuring.—Allow me to bear testimony to the value of this mode of applying liquid manure to Melons and Cucumbers. I have practised it for the last five years as follows:—Having put in the pit or frame about two-thirds of the soil intended for the plants, I then placed on this soil horizontally, at about 18 inches from the sides of the pit (all round), a row of common drainage pipes about two inches in the bore, together with three or four placed perpendicularly leading into them—I then put on the other third of soil. By this means you are able to water the roots with liquid manure without interfering with the surface. As a proof of the success of the plan, I may mention the following facts:—On the 21st June, 1853, I exhibited a Victory of Bath Melon at the Guildford Horticultural Exhibition, and gained a prize. I brought it home, sowed the seeds next morning, and cut and showed on the 24th September at the same place, from this sowing, and gained another prize. This surely was not bad work. *W. H. Wheeler, Hendon, Middlesex.*

Water Wheels (see p. 175.)—"S. N." should consider, before he lays out his money on a water wheel, what his power is worth. He has 42 feet fall, and half an acre of storing pond. Taking the rain-fall at 24 inches per annum (how else is his pond to be filled?), and supposing the clouds will be kind enough to allow him to keep half his yearly store by him at all times, and making use of your reply to "H. W." at page 181, I value his power at 1 horse 8½ minutes per day, or 1 man ½ an hour daily; in money about one penny. If he still thinks this small power might be turned to use, let him put in a wheel on the principle of Appold's Centrifugal Pump, where every drop of water which enters produces its due effect. An overshot water-wheel, 42 feet high, is in his case ridiculous. *Molar.*

Hybrid Rhododendrons.—Allow me to ask Messrs. Standish and Noble to name any hybrids which have been produced by a cross from ciliatum or glaucum, as I see they recommend them as breeders, and of course their recommendation is not a theoretical one. *W. F., March* 19.

Ipswich Standard Cucumber.—Permit me to furnish you with a specimen of this Cucumber, which is, however, by no means perfect, but is merely sent as an example of what kind of fruit it produces when the plants are overcropped. On Friday the 16th, four Cucumbers, all over 20 inches long, were cut from one plant, and the specimen sent for your inspection is one of them. *T. Wild, Ipswich.* [It measured 20¼ inches in length and 5¼ inches in girth. Its only fault was that it was a little irregular in thickness.]

Roasted Potato Sets.—The following is the result of my second year's experience in roasting Potato sets:—These were kept on the hot flue near a month before planting out, which was done in June to procure a late crop of new Potatoes. Some time before the disease had generally shown itself, one plant was very securely inclosed under a hand-glass; now precisely at the same time that the attack upon the crops in general commenced in my neighbourhood, the whole of these showed unequivocal symptoms of the rot, nor was the well covered plant any more protected than those immediately around. The result of my observations lead me to conclude that the cause lies at one particular time of the year, and not in the age of the plant, for that does not secure them; but, on the contrary, the younger they are at such time the more severe the rot will be; therefore those are right who recommend planting early. Last year the mischief, severe in the tops, did not show itself at first much in the tubers here, but a great many apparently very sound ones were found tainted afterwards, and had to be re-sorted over and over again with loss. *C. G., York.*

Henry Dixon.

Pinus insignis.—One peculiarity of this Fir is the difficulty in good ground of keeping it upright; another, that if you cut off a branch in spring it sprouts from the mutilated stump exactly like a deciduous tree. Except in gravelly or sandy soils, a good specimen cannot be considered safe from being uprooted however carefully planted. *Somerset.*

May's Magnum Bonum, alias Bedale Hall Cos Lettuce.—Observing that Mr. May is advertising this Lettuce in your columns, I wish to say that it is decidedly one of the best summer Lettuces grown, attaining the largest size; it requires to be planted 2 feet apart each way, which space it will quite fill up. It is a sweet and tender Lettuce, and will last good longer than any other. Bearfield's Bath Cos is the best Lettuce extant for autumn and winter use; indeed it is a good Lettuce for all seasons of the year, and stands the winter in the shape of young plants with impunity. *C. Hewson, Bedale Hall, Yorkshire.*

Holcus (Sorghum) Saccharatus.—We read in the "Botanische Zeitung," that at the sitting of the Berlin Society of Naturalists, on the 16th January, Herr Lüdersdorf spoke of the Sorghum saccharatum with relation to its saccharine principle. According to him the saccharine principle is only developed in the stem towards autumn, and is more considerable in the lower part of the stem than towards the panicle. The sugar contained in the whole stem is, according to his experiments, only 7·54 per cent, and, therefore, much less than Vilmorin found. This sugar is for the most part cane-sugar; but is unfortunately, like the sugar of Maize, mixed with Grape-sugar, so that the Sorghum is not likely to add to the number of useful sugar-bearing plants. Specimens of the plant and of the sugar produced from it were laid before the Society. *B.*

Trees broken down by Ice.—The effect of ice in weighing down the branches of trees, when it is formed as fast as the rain falls, as mentioned by Mr. Rogers in the *Gard. Chron.*, Feb. 10, 1855, is described in an article in the "Magazine of Natural History" (vol. vi., p. 100), from which a very graphic quotation is given in Loudon's "Arboretum" (vol. iv., p. 2136). A view of a Birch forest near Saratof, broken by the weight of the ice and bent down into the snow, is printed in Pallas's "Voyage through the Southern Provinces of the Russian Empire" (vol. i., p. 88). The description of the phenomenon is given at p. 55 as follows:—"After passing the Sokura we met with considerable heights, which abound with wood, and divide the brooks of the Tshardym from those of the Kurdyum. Here our curiosity was gratified by a new and uncommon appearance of the trees, of which we had received an imperfect idea in the former part of our journey. The cause of this singular phenomenon was as follows. Severe hoar frosts had commenced in these regions before Christmas, and were followed by snow mixed with rain or sleet, so that even the smallest branches of the trees were covered with ice an inch thick; by this all the flexible Birch trees had been bent to the ground in semicircles. Their tops and branches were thus buried under the continual snow, which lay upwards of a yard deep and kept the trees in that recumbent state. The interior full-grown Birch and Oak trees had been partly split and partly broken by the weight of the congeated snow on their tops, while their collateral branches were also bent to the ground. The thaw which began here towards the latter end of February and the rays of the sun indeed melted the icy incrustations on the upper part of the trees, but it still remained undissolved on the branches which were fixed in the snow. The cylinders of ice on one side all appeared melted into a solid mass, but on the lower part they were crystallised, some according to the usual configuration of frozen water, in hexagonal and partly in rhomboidal figures, while others consisted only of hexagonal sections. These bodies were like the well known hollow cubes of salt, apparently formed of icicles of a pyramidal figure when inverted, broad on the surface, and narrow towards the inner part where they were fixed in the ice. A similar phenomenon was observed in many woody regions beyond Saratof." *M. J. B.*

Coniferæ.—Like your correspondent "Pinus Glomeratensis" I should much like to see some competent authority taking up the nomenclature of such new, or rarely known Coniferæ, as were not included in the synopsis of Coniferous plants published in the Journal of the Hort. Soc. Many kinds of Cupressineæ and Abietineæ are to be met with, scattered through various nursery establishments, but it is difficult to say what they really are, not being referable to anything there mentioned. Again much confusion exists in the names of species which have been long introduced. I now only allude to Abies grandis and amabilis—the one being often substituted for the other, and *vice versâ*. From an inspection of many collections I am of opinion that there are very few plants of amabilis in the country, and very few more of grandis; most of the plants I have examined under the name of amabilis being nothing more than Frazeri. Mr. Veitch has however seedling plants of true amabilis in a small state. I once purchased a plant of Pinus bungeana from Mr. Glendinning, who informed me it came from Japan, and reached him through a continental nursery. Pinus Padufica, or Padufiana, I know to come from the Crimea, having myself received cones from thence; the species belongs to the two leaved section, and has cones closely resembling the Scotch Fir. There is a desire to rectify in the names of many species of Cupressus. I may mention the one under the name of macrocarpa, or its synonym, Lambertiana—as it represents two plants of very distinct habit. I have another kind named Knighti or majestica, about which I can hear nothing; it is a very fast grower, and is making a grand looking tree, evidently of the Thurifera section. Corneyana, as your correspondent observes, is certainly not chinensis fœmina. The Junipers are likewise in much confusion and require a revision to correct their names; which can however only be satisfactorily done by an examination of living specimens. I am a great admirer of Coniferous plants myself, and anything which will help to throw light on their history will be acceptable to all interested in their cultivation. *John Spencer, Bowood.*

The Winter in East Lothian.—The effects of the late severe frosts in this district have of course been various, according to the elevation and dryness of the situation, but so long a continuance of such a low temperature as 1° and 2° above zero is not remembered here, and consequently the destruction amongst evergreens and plants usually considered hardy has not been exceeded during the last quarter of a century; the foliage of the former has in all cases been browned, and in some instances the plants have been killed to the ground. All the Brassica tribe, and even Leeks not covered with snow, have been blanched and withered; and Cauliflowers, where not under glass, have been completely destroyed. In my garden, the soil of which is low and damp, and exposed to exhalations from a small river, I have suffered severely. Besides the effects noticed above, all China Roses even on a south wall have been cut down to the roots. On Moor Park Apricots, covered with flower buds, I do not expect half-a dozen blossoms to expand, the buds being all brown and lifeless. Peaches are a little better, and a good many forward Pears are in the same condition. It is satisfactory to observe how well Mr. Fortune's importations have weathered the storm, Weigela rosea, Forsythia viridissima, Spiræa prunifolia being apparently uninjured, while a small plant of the beautiful Jasminum nudiflorum, just coming into bloom, once or twice in the intervals of the storm, and surrounded by snow, opened a few blossoms, and is now nearly covered with fully expanded flowers. In a few weeks the ravages of the weather will be more distinctly marked out, but it will take many years to restore plants to their former condition, and some valuable specimens will never recover. *John Ferme, Haddington.*

Preserved Vegetables.—The great diminution of the bulk and weight of vegetables preserved in M. Masson's way is of considerable importance, whether as saving land carriage, or freight of sea-borne; but it may be questioned whether pressure of such articles be otherwise desirable, more especially as it is owing to the process that the vegetables require so considerable a time to cook them. For soups and stews this would be no objection, but in most other cases a material one. It is possible that the aroma of vegetables may be better preserved in cakes of them than if exposed in their natural form to the air; and on this account it might be expedient to press those herbs or roots that are suitable for soups or stews; but where a natural appearance is

desired, it might be advisable to dry vegetables as far as possible in their natural form, as green Peas and French Beans are dried in Russia. It would seem that vegetables of the most delicate kinds might be so preserved for winter use, Cauliflowers for example; but they would require division into small portions, so that they could only be served at table in a sauce, either white or brown, and in cooking them the first process would be soaking in tepid water till they had absorbed a sufficiency to bring them to their pristine state. Such herbs as Spinach and Sorrel might be pressed, since it is customary to mash them up in preparing them for table; so it is with Turnips. Sweet herbs of most kinds require only to be dried and bottled, but Parsley loses its peculiar flavour when most carefully dried; possibly the green tops of Celery might in a manner supply its place, as is not uncommon in France. It might be worthy of experiment whether roots, Carrots for example, might not be easily pressed in their natural form, whereby they might be served whole. It is needless to add a word on the great luxury as well as the economy of adopting M. Masson's process on an extensive scale, since it has been so ably advocated in the *Gardeners' Chronicle*; but its pages have not adverted to the employment it would afford to women and children in picking and cleansing the vegetables. A friend has suggested that it might afford suitable occupation for paupers. It was stated in the *Times* last week that a Union in Devonshire had realised a considerable profit by employing its paupers in the cultivation of vegetables; but, doubtless, much more would be gained by drying them also, since a market would thus be ensured. The strong and robust pauper might be the cultivator, whilst the old, the infirm, and the little child, would have sufficient strength to shell Peas, to divest Cabbages of caterpillars, or to wash roots, &c., preparatory to drying them. *B.*

Societies.

Entomological, *March 5.*—The President in the chair. Mr. Stevens exhibited several cases of insects, forming a series of the species of all orders collected by Madame Pfeiffer in Amboyna and Ceram. The specimens had been brought home folded separately in bits of paper or between layers of cotton wool, and were in perfect preservation, many being of very great rarity. Mr. Edwin Shepherd exhibited a remarkable specimen of Arctia caja, the common garden tiger moth, the upper wing of the left side of which was marked throughout its whole length with a narrow dash of red; also a Triphæna orbona, the upper wings of which presented almost the appearance of those of a Glæa. Mr. Edward Sheppard exhibited a bag of silken tissue without seam, used by the Chinese for lapping up the ends of rolls of spun silk. Dr. J. E. Gray stated that it was formed by beating out a single cocoon, and that Mr. Reeves had brought many specimens of it to this country. It was announced that a prize of five guineas had been offered by the Society for the best essay on the Coccus which produces the lac dye of India, to be forwarded on or before the 31st December, 1855; and it was stated that the East India Company had agreed to afford all the information in its power relative to the subject. The Secretary also announced that it was the wish of the Society to obtain the co-operation of members who had studied British Coleoptera in the formation and publication of a list of British beetles for distribution and labelling of cabinets. Mr. Newman read a notice of the honey bee of South Africa, a species stated to be only half the size of the English hive bee, and to be so prolific as to allow the comb to be cut away eight times in the course of the year. Also on the ravages committed by the common toad, as well as by the woodpecker, upon beehives, the latter not only having been observed tapping at the hive to induce the bees to come forth, but actually picking the mortar off the foot-board so as to make additional places of exit for the bees. Mr. Westwood also stated that at a particular period of the summer he had observed the common sparrows with their young broods to be very injurious to bees, the female bird flying up to the mouth of the hive and catching the bees as they take wing. Mr. Newman also read a notice by Mr. Wallace on the peculiar habits of two groups of Eastern butterflies, one of which sits with its wings deflexed, like the sphinges, whilst the other is very strong in its flight, hovering in the same manner as the same insects. Mr. Douglas read a note as to the means of avoiding and curing greasiness in insects preserved in the cabinet, which led to an extended discussion on the subject. Mr. Waterhouse read a note by M. Jekel on the scarce British Weevil Omias sulcifrons, lately also taken by M. Chevrolat near Brest. A note by Dr. Schaum was read on a species of Cetoniadæ recently incorrectly figured by Mr. Westwood as the Heterorhina bicostata; likewise on the species of Elateridæ recently described by Mr. Curtis, of which he corrected the nomenclature. A note was also read by Mr. Janson on the latter subject, proving most of the supposed new species to have been previously described by continental authors. A discussion having been raised upon the subject the President withdrew his inaugural autobiographical address.

Garden Memoranda.

Mr. Low's Nursery, Clapton.—Few nurseries contain a more extensive collection of plants in pots than this does. Upwards of 14 houses are appropriated to their accommodation besides long ranges of pits, consisting of many hundred lights. To keep the inmates of the latter in a healthy condition during the late severe weather has been no easy task; this, however, has been accomplished perfectly by means of good protections, made of reeds woven together with tar twine in the way in which straw coverings are made. In addition to these, mats and Fern have also been used, and it is surprising to see how safely and well Heaths and other plants of similar hardihood have wintered under them. In these pits we noticed Sarracenias of various kinds, Venus's Fly-traps (Dionæa Muscipula), and one or two hardy Canadian Lady Slippers (Cypripediums). Trilliums have also been wintered here, together with several plants of a violet called Viola pedata from New Jersey. In the Heath-house some of the winter flowering kinds were in blossom, such as hyemalis and gracilis, and even triumphans was beginning to open a few flowers. Under the stage were many fine plants of the Funereal Cypress, which it had been thought would winter better there than out of doors. Among other Conifers we remarked plants of the rare Thuja gigantea, which is said to be the same as the Libocedrus decurrens of Torrey, together with examples of Libocedrus chilensis, and Torreya Myristica, a fine coniferous tree, with foliage resembling that of a Cephalotaxus. Of Araucarias there were several, and among them some handsome plants of excelsa from cuttings, which, when made of the top or leading shoots, Mr. Low thinks form as good trees as those raised from seeds. Where the leader has been removed new shoots push out, which also strike readily, and make handsome plants.

In a long lean-to house were numbers of Camellias and Orange trees, the latter with clean straight stems from 4 to 5 feet in height, and with heads measuring from 2 to 3 feet in diameter. These, as may be imagined, will make very useful trees. Lapageria rosea has been raised here in abundance from imported seeds. They were sown in peat and loam, and nearly every one of them in many potfuls has germinated freely. Of Pitcher plants Mr. Low has a few of the best kinds, and of Orchids a great many, though most of them are plants recently imported. For these and other things a long span-roofed house is being built with a raised stage in the middle and slate shelves. It is heated by hot-water in 4-inch pipes, and glazed with 16 oz. sheet glass in small panes, long ones having been found here liable to split down the middle. Of Mangosteens and the Bourbon Palm Latania borbonica we noticed several plants. The latter have been raised from seeds sown in peat, in which they often lie five months before the young plants make their appearance. A very long span-roofed house is filled with Camellias and Azaleas. Of Ferns there is a good collection here, as indeed there is of most tribes of plants, the repotting of which and otherwise putting them in order for the summer are now works in active progress.

Notices of Books.

Century of Ferns, being Figures with brief Descriptions of One Hundred New, or Rare, or Imperfectly-known Species of Ferns from various Parts of the World, a Selection from the Author's Icones Plantarum. By Sir W. J. Hooker. Pamplin. 1854. 8vo.

It is much to be regretted that the admirable series of drawings and descriptions of new or rare plants contained in Sir W. J. Hooker's "Icones," remarkable alike for fidelity of execution and intrinsic interest, did not meet with that support from botanists which might have insured its continuance. Such works, unhappily, in this country, so far from proving any source of remuneration, are, for the most part, a certain loss, as every one who, from a love of science, wishes that the public should be partakers of the riches of his collection, is sure, sooner or later, to know to his cost. The series of drawings is now very voluminous, and though published at an extremely low rate, requires an outlay which is not within the means of many more humble cultivators. As, however, one of its most interesting features is the excellent and copious illustration of that most difficult but lovely tribe the Ferns, and as the cultivation of these is increasing every day in favour with the public, it has been thought advisable to select a number of the most instructive figures, publishing them in a separate volume, of the appearance of which we now apprise our readers. The drawings themselves are from the pencil of Mr. Fitch, a circumstance which not only insures correctness of detail and outline, but a degree of taste which is so often wanting in the mere botanical maps with which the botanist is so often afflicted. Their interest is not confined to the species themselves, but most important observations on the value of nervation as regards generic character, a point when justly estimated of great weight, though easily carried beyond all reasonable bounds, accompanied by just criticisms of other labourers in the same field, will repay attentive perusal. Those lovers of Ferns who wish to obtain some general views of the riches of the tribe will be enabled to gather from it a large mass of information, while their attention will not be called to mere herbarium species confined to the author's own collection or founded upon individual specimens; but they will find just views as to the value of forms, and will be able to recognise occasionally, if their collection is at all extensive, some of the species which they cultivate, which perhaps they would not be able to do from any other source. To suit the views of purchasers, there are both plain and coloured copies; and we think that we cannot give better advice to those who love elegance of form and not mere beauty of colouring to make themselves possessors of this attractive volume.

The Vicar of Wakefield, with 32 illustrations by Mulready (square 8vo., pp. 306, Van Voorst, 1*l.* 1*s.*) is a beautiful book, admirably printed, and adorned with exquisite wood-cuts, engraved after delightful designs by Mulready. For presents, or for the shelves of a library of illustration, the present season has produced nothing more interesting or more worthy of patronage. It even adds to the high reputation of Mr. Mulready as an artist, which is saying a great deal.

Miscellaneous.

Climate of the Crimea.—The weather has been of the most extraordinary character for the last few days. Three days ago the very sight of a great coat or warm pair of gloves made one perspire; next day it was so cold that even our immense stores of warm clothing were not superfluous: out of the midst of summer you are here suddenly precipitated, at half an hour's notice, into the midst of winter. At the end of this month we may expect rainy and warm days, and the sun becomes exceedingly powerful at times so early as the month of May. Three days ago the thermometer stood at 56°, next day it fell to 40°, in the afternoon it was at 32°, at night 28°. Yesterday morning early it was at 22°. This morning it was at 24°; it is now at 36°. Twice or thrice during this time the country has been obscured by drifting fogs, which have nothing of the characteristics of our "old London particular" except density. The influence of a few hours' sunshine here is remarkable. We have had a few warm days only, and yet the soil, wherever a flower has a chance of springing, pours forth multitudes of Snowdrops, Crocuses, and Hyacinths. The Chersonese is covered with bulbous plants, some of great beauty, and the shrubs contain several rare species. The finches and larks here have a Valentine's-day of their own, and still congregate in flocks. Very brilliant goldfinches, large buntings, gold-crested wrens, larks, linnets, titlarks, and three sorts of tomtits, the hedge sparrow, and a pretty species of wagtail, are very common all over the Chersonese: and it is strange to hear them piping their throats and twittering about the bushes in the intervals of the booming of cannon just as it is to see the young spring flowers forcing their way through the crevices of piles of shot and peering out from under shells and heavy ordnance. The insides of our huts are also turned into gardens, and Grapes sprout out of the earth in the window sills, the floor, and the mud walls. *Correspondence of the "Times," dated March 2.*

Gas Tar in Horticulture.—A discovery, which is likely to be of advantage to agriculture, has lately been reported to the Agricultural Society at Clermont (Oise). A gardener, whose frames and hot-houses required painting, decided on making them black, as likely to attract the heat better, and from a principle of economy he made use of gas-tar instead of black paint. The work was performed during winter, and on the approach of spring the gardener was surprised to find that all the spiders and insects which usually infested his hot-house had disappeared, and also that a Vine which for the last two years had so fallen off that he had intended to replace it by another had acquired fresh vigour, and gave every sign of producing a large crop of Grapes. He afterwards used the same substance to the posts and trellis works which supported the trees in the open air, and met with the same result, all the caterpillars and other insects disappearing. It is said that similar experiments have been made in some of the vineyards of the Gironde, with similar results. *Galignani's Messenger.* [We have always understood that gas-tar will kill plants by its effluvium.]

FLORICULTURE.

Seasonable Hints.—Auriculas at this season require much attention; their pips will be rapidly advancing. See that they experience no check from cold winds or other causes; but by no means keep them closely shut up, or weakened flowers will be the result. Early sorts intended for exhibition next month should at once be selected, and care taken to promote their flowering. Cinerarias.—These will be benefited by an occasional application of liquid manure. See that their flower-shoots are carefully tied out; this will strengthen them materially, and be productive of better defined colours. Dahlias.—The propagation of these must be proceeded with; those already struck should be potted off and kept in a hotbed for a few days to re-establish themselves after the shift. Fuchsias will require re-potting: cuttings taken off now will root freely and make nice blooming specimens to succeed the autumn struck plants. Hollyhocks must be shifted on as the pots get filled with roots; otherwise they will be pushing up their flower stems, much to the injury of their after welfare. Pansies in the open ground should be top-dressed and made secure from injury which heavy winds are sure to inflict on loose or straggling plants. Those in pots under glass must never be shut up closely. Pelargoniums intended for July flowering should now be stopped; let them become dry for a day or two, which will induce the formation of "back breaks," and these will be materially assisted by keeping the house rather close for a few days after the operation, avoiding also too much moisture; but as the buds show boldly

and indicate growth, occasional syringings may be given. Pinks should now receive a top-dressing. Tulips.—Mild gentle rain, when we are favoured with it, may be admitted as growth proceeds; occasionally stir the surface, and perseveringly protect from hail or frosts. Verbenas.—Continue to take off cuttings, and to pot off as they strike root, using light rich soil and small thumb pots; keep them in a slight dung-heat.

Cinerarias: *H.* The compost we would recommend for specimens intended for exhibition, and for large plants generally, would be two parts of good turfy loam, and equal parts of well-decomposed cow-dung and leaf-mould, with an admixture of silver or river sand. As the plants grow, take care to thin out all superfluous leaves, so as to admit the air freely and prevent mildew, which is a great pest, and which can only be removed by applying sulphur to the parts affected. The Cineraria should only be stopped once, as the second operation tends to produce weak growth. As soon as the shoots are long enough, tie out wide, keeping the outer branches as low as possible, and place them close to the glass, which will insure dwarf and compact plants. We had nearly forgotten the drainage, which should be of rough leaf-mould and potsherds mixed; this will keep the roots in a clean and healthy state.

SEEDLINGS.

Azaleas: *G H.* The best are Nos. 1 and 4: 1 is a brilliant rosy salmon, semi-double, and measures fully 3 inches across; 4 is rosy pink, and spotted on the upper petals. Both are well worth cultivating.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—In addition to the plants mentioned in last week's calendar as suitable for the decoration of the show-house in autumn, there are many greenhouse plants which soon form useful specimens if placed in favourable circumstances, and encouraged with pot-room, &c., such as Fuchsias, Croweas, the beautiful Luculia, and many others. The old Gardoquia Hookeri is a beautiful thing for autumn decoration; but it is too late to do much good with it for this season. Then there are quantities of things which may be raised from seed and grown into showy specimens, as Thunbergias, Ipomœas, Globe Amaranthus, Balsams, Cockscombs, &c., which are all useful enough where better things are scarce. But where these things are likely to be wanted there is no time to be lost, and every effort should be used at once to provide an ample stock of the most showy things that can be commanded. Camellias that have done flowering should be thoroughly cleaned, washing the foliage with a sponge, &c., if necessary; and if any of them are infested with scale this must be removed first, for there is no getting plants to thrive unless they are kept clear of insects. Repot such as require it, and place them in a suitable position for making their growth. Azaleas for flowering about next Christmas should also be encouraged to make their growth; and Epacrises that have done blooming should be cut back, and kept rather close and moist, in order to induce them to make early growth. These are first-rate plants for winter flowering, and by starting them into growth about this time, and getting their wood matured early in autumn, many of the varieties will be in full blossom in November, and their flowers last much longer at this season than after the sun becomes powerful in spring. Proceed as diligently as possible with the repotting of such of the hard-wooded plants as require it, so as to afford them a fair chance of making a vigorous season's growth, and endeavour to keep the newly potted stock as much together as circumstances will admit for a few weeks after potting, keeping the atmosphere rather closer and moister than usual. Stove.—Many of the plants here will be in vigorous growth, and will require careful attention. Attend to stopping, tying out, and regulating the growth as may be necessary, and do not let free growers suffer for want of pot room. Most stove plants enjoy a moderate supply of manure water while growing freely, and this should be given liberally to such things as Clerodendrons, &c., using it very weak at first, and taking care to have it at about the same temperature as the roots are growing in. A little of this sprinkled about the pots in the evening so as to charge the atmosphere with ammonia, will also be beneficial to the plants. Secure a thoroughly moist atmosphere by frequently sprinkling the paths, &c., and give air cautiously, and on the sheltered side of the house during the prevalence of cold easterly winds. Look sharply after insects of all kinds, and allow these no quarter, for if they are allowed to establish themselves upon the young growths they will soon ruin the most promising specimen. See to having shading in readiness, for some things are very impatient of bright sunshine at this season, particularly when air cannot be given freely without rendering the atmosphere too dry.

FLOWER GARDEN AND SHRUBBERIES.

The cold drying winds from which we are now suffering are exceedingly trying to recently transplanted trees or shrubs, and unless these are well attended to there will be but little chance of their escaping injury. See that they are secured against being blown about by staking, or whatever other means may be preferred, and where the soil is of a sound dry nature, watering will be necessary at once, unless the weather should become more favourable. In watering things that have been lifted with a ball the water is very apt to pass off through the loose soil, without soaking the ball where the roots are, and care should be used to prevent this, which is easily done by forming a basin over the ball. It is of the greatest importance to well care for plants after shifting until they can form fresh roots, and get established; but this is too often neglected in the bustle of this busy season, and many plants are allowed to get into a weakly state after shifting which with proper after care would not have been in the least injured. Indeed, success in transplanting large trees is quite as much dependant upon after care as upon their being lifted with large balls, &c. Push forward any alterations still remaining to be done, and get this work completed as quickly as possible, in order that the place may be got into good keeping. The bedding-out season will soon be here, and unless there is already a sufficient stock of cuttings put in, no time should be lost in getting in every one which can be procured, for it is most desirable to have strong well-established plants at turning-out time. If not already done, pot up scarlet Geraniums that have been wintered in boxes, and place them in a close frame to encourage them to make a nice short growth, and get them well inured to the air before planting out. Few places are overstocked with the variegated Geraniums, and these should have every attention. Where cuttings can be obtained they will be found to root very freely at this season.

FORCING DEPARTMENT.

Pineries.—Where the Pines are grown in pots, it is by no means a bad practice to occasionally rearrange those in the fruiting pit, placing those showing by themselves, so as to be able to afford them a rather drier atmosphere while in bloom; for at this season there is some danger of badly-formed fruit if the atmosphere is kept too moist, or the syringe used too freely while the plants are in bloom. Those expected to show shortly should also be kept as much together as circumstances will admit, so as to avoid having to disturb the arrangement for some time to come. Indeed, where a regular supply of fruit has to be furnished from only a moderate quantity of plants, frequent rearrangements will be necessary; for it is, perhaps, impossible to regulate the treatment so as to get every plant to fruit just at the desired time, and hence it will be necessary to use every means to regulate the supply, such as removing a portion of the plants to the coolest division when too many happen to show at once, which is frequently the case at this season, and forwarding others as much as can be done. Plants swelling their fruit can hardly be afforded too moist an atmosphere, and they must be carefully attended to with water at the root, giving clear liquid manure in a rather strong state, and some of this should also be sprinkled upon the tan, &c., so as to make the atmosphere resemble a dung pit. Shut up early in the afternoons of bright days, letting the glass rise to 85° or 90°, moistening the plants with the syringe, and sprinkling the passages so as to saturate the atmosphere with moisture, but avoid high night temperatures or a too free use of fire-heat. Vineries.—If fermenting materials have been used for warming the borders these must be turned occasionally, adding fresh as may be necessary to maintain a gentle warmth in the border, for it will not be safe to neglect this at present. Ventilate cautiously, on cold windy bright days admitting air on the sheltered side of the house only, and keep the inside borders moist by occasional sprinklings, so as to counteract the drying effects of cold air and bright sunshine. If it is desirable to prevent the Vines in the late house from starting for some time yet, they should be let down as far from the glass as can be conveniently done, and the house shaded, unless the Vines can be taken out, which would allow of the house being used for other purposes, and there is no danger of the weather being such after this season as to injure the Vines. Houses in which the Vines are starting should be kept thoroughly moist, syringing the Vines morning and evening, and the rods bent as may be necessary to induce the buds to push regularly. Peaches.—Where the fruit is fairly set, maintain a nice humid atmosphere, giving the trees a good washing with the syringe just before shutting up in the afternoon, so as to keep them clear of red spider, and see that the soil about the roots is in a properly moist state. Attend to disbudding and tieing in the shoots, keeping them thin and regular. Here as elsewhere it will be a work requiring careful attention, while the present state of the weather lasts, to properly regulate the ventilation, but this must be attended to at any expense of time or trouble.

HARDY FRUIT AND KITCHEN GARDEN.

Pruning, nailing, and the planting of all kinds of fruit trees should be finished at once if not already done; and recently planted trees should have their roots mulched, to protect them from the effects of drying winds; and standards should be carefully staked, so as to prevent their being blown about by the wind, and having their young roots broken off as fast as they are formed. Take advantage of the firm dry state of the ground to get manure wheeled upon quarters where it is likely to be wanted soon. Cauliflowers, Peas, &c., that have been lately removed to the open ground from under glass should be afforded some shelter against excessively cold winds. For Peas we know nothing better than the Spruce branches recommended last week, and the old practice of covering Cauliflower plants with inverted flower-pots will, in the absence of any better covering, be found a great protection to the plants. Forward Celery plants for an early crop by pricking out on a gentle hot-bed, and sow on the same for a succession crop. Attend to providing a regular and plentiful supply of Peas, &c., by sowing quantities proportionate to the demand at regular intervals; also keep up a supply of French Beans and Asparagus, and Seakale, &c., by introducing quantities into heat at short intervals; and advantage should be taken of the dry state of the mould to prepare ground for fresh plantations of Asparagus, Seakale, and Rhubarb, which it is necessary to make every year where these are used largely for forcing. The ground for these should be trenched some 3 feet deep, and plenty of rotten manure well incorporated with it as the work proceeds, for it can hardly be rendered too rich if good crops are to be obtained.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending March 22, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 31st, 1830—therm. 75 deg.; and the lowest on the 25th, 1836—therm. 14 deg.

Notices to Correspondents.

Asparagus: *J S.* Make your new bed now of good rich soil, not less than 3 feet in depth. Two year old plants will answer quite as well as three year old ones; indeed better if the latter have grown all the time in a seed bed.‡

Black Honey Dew: *G A.* This is produced by the scot fungus Torula fumago, a terrible pest. It should be removed if possible. You might try dusting the part affected when wet with flowers of sulphur, or washing with fresh made lime water. It ruins plants if it is not checked.

Books: *U R.* Brown's "Forester."

Canvas: *A Sub.* You will not succeed in rendering this quite water tight without painting it. Boiled oil is very useful. You might try the effect of the following receipt:—Mix in boiling water equal parts of roach alum and sugar of lead; immediately plunge the cloth into the solution and let it remain, covered by the fluid, for 24 hours. Then take the canvas out, do not press or squeeze it, but hang it in the shade to dry very slowly. Half a pound of each material is enough for 6 gallons of water. When dry, brush off the white deposit, and the article is ready for use. In good woollen cloth this is effectual; we do not know how far it answers for linen.

Diseases: *S P M.* We have examined your Grapes and leaf very carefully, and do not find a trace of mildew. There are, indeed, certain white spots, especially on the under surface of the leaf, which look like carbonate of lime, but they do not effervesce with sulphuric acid, and therefore probably are due to the anti-blight composition. Let us recommend you, before you mak use of such compositions, to ascertain that you really have got the disorder for which they are recommended. We suspect that you will find some very different cause for failure. *M. J. B.*

Fern Cases: *J R.* When in London, you had better look in at Mr. Kennedy, of Covent Garden.‡

Gas-water: *Vectis.* Diluted gas-water will kill green fly, no doubt, but with what proportion of water it should be used we cannot say, because its strength is variable. It turns lead paint black; and if too strong will burn the leaves. You should make a few experiments with it upon some *corpus vile* before applying it to your Peach trees.

Guava Jelly: *A Constant Reader* will thank some of our correspondents to give him a receipt for making Guava jelly from fresh Guavas, as in the West Indies.

Insects: *S. F.* The insect caught in a piece of Turnip is the young caterpillar of a moth which during the summer, when nearly full grown, does great injury to the crop of Turnips. You may know the wireworm by its resembling a bit of polished wire, measuring from half to an inch in length. It is the larva of a beetle. *W.*

Heating: *G R.* There is no objection to using gas for this purpose, provided you can secure the stove from leakage or allowing the gas to escape into the house. This is very difficult to accomplish. If you do use gas you should place an evaporating pan of water near the source of heat, with a view to preventing the air of your house becoming over heated.

Labelling Plants: *Anne.* Your gardener ought to know better than to give you such advice. The face or named side of the label should never be towards the plants of which it is the name. Just the reverse is the proper practice.‡

Mahaleb Stocks: *Iota.* Either graft or bud them with Cherries, whichever process you prefer. This stock dwarfs the Cherry in the same way as the "Paradise" dwarfs the Apple. We hope your Escallonia macrantha will shoot again. It has survived even this exceptional winter in many places.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is only requested that, in future, not more than four plants may be sent us at one time.—*Thomas Lang, Geelong.* Festuca bromoides and Phalaris canariensis, both introduced, no doubt. We cannot undertake to pay the postage of either foreign or home letters.

Planting: *F H G.* We do not know who wrote the article on Useful and Ornamental Planting in the "Library of Useful Knowledge." For the cultivation of Oaks you should consult Brown's "Forester;" for the sorts in cultivation, Loudon's *Arboretum Britannicum:* but the information given there is not so satisfactory as it should be.

Reports on Nurseries: *Omega.* Not sufficiently well written. We never insert such reports unless furnished by our own reporters.

Slugs: *S F.* Quicklime would certainly be more lastingly effective than salt in a garden where the soil is extremely retentive and imperfectly drained, and in which you cannot keep the slugs under.‡

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; Mr. H. Campbell, 87, Dale Street, Glasgow; and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
OFFICES, 37, CHARING CROSS, LONDON.
Directors.
The Hon. J. W. Fortescue. | General Macdonald, C.B.
G. P. Irvine, Esq. | Newton S. Scott, Esq.
Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Solicitors—Messrs. Vallance & Vallance, 20, Essex Street, Strand.
Agricultural Chemist—William White, Esq.
Secretary—Mr. W. F. Mould.

The Directors invite the attention of landed proprietors, agriculturists, &c., to the Patent Cyanic Manure, as containing the most approved elements of fertilisation in their just proportions; it can be, therefore, confidently recommended as a very superior dressing for Wheat, Barley, Oats, Clover, Grass, &c. Price 8*l.* per ton.

Prospectuses (with practical directions for use) may be had on application, or will be forwarded by post.

All orders, applications for Agencies, &c., to be addressed to the Secretary, at the offices of the Company, 37, Charing Cross.

THE MANCHESTER SEWAGE GUANO COMPANY respectfully inform Agriculturists that they have made arrangements which will enable them to meet the increasing demand for their Manures. The MANCHESTER SEWAGE GUANO is a compost of Blood, Bones, Urine, Nightsoil, and other Animal Matters, and highly fertilising Chemical Ingredients, which are in a concentrated state incorporated with Animal and Vegetable Charcoal, ground to a fine powder, *the whole forming a dry portable Manure.* It is free from all kinds of Seeds, Weeds, &c., and enriches the land to a considerable degree for several years after it is used. Price 5*l.* 5*s.* per ton. Net cash on delivery. Testimonials forwarded on application. Carriage free to any Railway or Canal Wharf in Manchester.—JOHN THOMPSON, Secretary, 3, Watling Street, Shudehill, Manchester.

TO AGRICULTURISTS.
BONE MANURE MANUFACTORY, DRAKE'S PLACE, PLYMOUTH.

PONTEY, ROWE AND CO. beg to acquaint the Agriculturists in the West of England, that in order to insure a supply of their MURIOPHOSPHATE, which has been tested 12 years, and found far superior to all other Artificial Manures, in the continual support it yields to TURNIPS and the succeeding crops, they have made considerable purchases of BONES and BONE ASH, from South America, Hamburgh, &c., on favourable terms. They will therefore be enabled to render their Muriophosphate the same strength as heretofore, at 7*l.* per ton, in bags free on board; or 7*l.* 5*s.* delivered to the principal Seaports in Devon and Cornwall.

They have obtained reports of the Analysis from the most celebrated Agricultural Chemists, Messrs. Herapath, Nisbet, and Way, and they will guarantee that they supply the same article as reported on. The Analysis referred to will be open to the inspection of purchasers.

P., R. & Co. have constantly on sale BONE MANURE of their own manufacture at their Mills, at Drake's Place, which is open to purchasers. Also best PERUVIAN GUANO from A. Gibbs & Co., GYPSUM, MANURE SALT, &c., prices of which can be obtained at the Manufactory, or of Mr. PONTEY, Seedsman, Cornwall Street. 2½ per cent. off for cash on delivery.

Also London Manufactured BONE MANURE.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

FARM SEEDS.

W. DRUMMOND AND SONS have implicit confidence in recommending the following Seeds:—

PERENNIAL RYE-GRASS, from the most select growths, and perfectly clean.

ITALIAN RYE-GRASS, direct from Lombardy, and through the same gentleman in that country who has for several years been employed by us in collecting those fine parcels which have hitherto given so much satisfaction to our customers.

GRASSES FOR PERMANENT PASTURE.—*Having been among the first to recommend the use of the* NATURAL GRASSES *in the formation of* PERMANENT PASTURE, *the subject has occupied a large share of our attention. We have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of our observations, as well as from the great satisfaction our selections have given, we feel warranted in recommending, in addition to the Grasses usually sown, a variety of such species as are known, not only to yield the greatest bulk of herbage, but the largest amount of milking and feeding properties, varying those species, and the proportions of each, according to the nature of the land to be laid down.* From the increased demand, we are enabled to charge a lower price than formerly. An excellent assortment, and allowing a *liberal supply* of Seeds, may be had at from 24*s.* to 26*s.* per statute acre.

TURNIP, in all the leading varieties, saved by ourselves from full-formed Bulbs.

VETCHES (or TARES), large broad-leaved, a very superior sort.

Priced Lists of the above, with every other description of Farm Seeds, may be had post free on application.

FREE DELIVERY.—All Parcels of Seeds above 2*l.* value (with the exception of Grain and Vetches), delivered free in London, Liverpool, Hull, Newcastle, Belfast, Londonderry, Aberdeen, Inverness, and to all the Stations along the Lines of the Caledonian and North British Railways, &c.

W. DRUMMOND & SONS, Seed and Implement Warehouse, Stirling, N.B.

PRIZE MANGOLD WURZEL, SWEDE TURNIPS, ETC.

JAMES GROVE, Great Baddow, Essex, who obtained Prizes at the Chelmsford and Essex Agricultural Show for nine years in succession, begs to state that his Seeds are grown from Selected Roots, not Plants. He begs to call attention to the following opinions of the press:—

"The roots shown by Mr. JAMES GROVE stand unrivalled."—Smithfield Club Show, 1848.—*Mark Lane Express.*

"The roots shown by Mr. JAMES GROVE were pronounced by many practical judges to be the most perfect specimens they had ever seen."—Smithfield Club Show, 1849.—*Bell's Weekly Messenger.*

"The Mangold Wurzel and Swedes exhibited by Mr. J. GROVE drew forth the warm encomiums of all who saw them. Mr. GROVE has devoted a great deal of time to the cultivation of Mangold Wurzel, and judging from the specimens at this show, his efforts have been eminently successful."—Smithfield Club Show, 1851.—*Ibid.*

Similar remarks were made in the Agricultural Journals on the roots exhibited by Mr. GROVE in 1852, 1853, and 1854.

Mixed Grass Seeds for Permanent Pasture.

RENDLE'S AGRICULTURAL PRICE CURRENT AND FARM DIRECTORY FOR 1855, *with Newspaper Stamp to go free by post, is now published, and can be had in exchange for six penny stamps.*

The proprietors of this well-known and widely circulated publication have much pleasure in announcing another edition for the present year. They have spared no expense nor trouble in making it a most useful and serviceable guide to all who take an interest in the cultivation of the soil. It contains a valuable Descriptive List of all the best AGRICULTURAL SEEDS, with prices affixed to every article, with cultural remarks and general information as to the best varieties for various crops.

The List of TURNIP SEEDS is very comprehensive, and is embellished with an ENGRAVING of RENDLE'S IMPROVED SWEDE TURNIP—a variety in great favour in the West of England.

The descriptive Lists and Tables of the best selected GRASSES are very complete, and will be found eminently useful to all who intend laying down land for Permanent Pasture, Ornamental Parks, Pleasure Grounds, &c.

There is a very useful ALMANACK, which has been compiled with much care.

In the MANURE DEPARTMENT there is a general Price Current of all the leading Manures, including Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, &c.

The ORIGIN AND HISTORY OF PERUVIAN GUANO will be found amongst its contents, as well as some excellent advice for detecting the spurious from the genuine article. The proprietors have been favoured with some good sound advice to Farmers on this point by J. C. NESBIT, Esq., the celebrated Agricultural Chemist. They have also reprinted PROFESSOR WAY'S LECTURE on the same subject, from the *Gardeners' Chronicle*, read to the Members of the Royal Agricultural Society.

Descriptive articles relating to Lawes' Patent Superphosphate, Nitrate of Soda, the new Mexican Guano, and other manures will also be found very useful and interesting.

The "SUPERPHOSPHATE CONTROVERSY" in the Plymouth Papers is also given at length. The whole of the letters are reprinted from the *Plymouth Herald.* In this Controversy the "*Gypsum mixers*" are fully exposed by Mr. J. PRIDEAUX, the eminent Agricultural Chemist.

A valuable Paper has also been written expressly for this Edition by Mr. R. ERRINGTON on the "*Cultivation of the Potato,*" as well as an article on "*Liquid Manure*" by the same gentleman.

The Proprietors have also much pleasure in stating that they have been favoured with two Original Articles, by J. B. LAWES, Esq., Rothamsted, the celebrated Agricultural Chemist, on "*The Artificial Manures most suitable for the Growth of Barley*" and "*The Cultivation of one Grain Crop after another on heavy land.*"

There will be a good Engraving of the CEDRUS DEODARA, one of the hardiest and best varieties of Cedars ever introduced, and prices of various Forest Trees, Shrubs, and Fruit Trees.

Engravings and descriptions of a great many Agricultural Implements are also added in the present Edition, and amongst them will be found M'CORMICK'S AMERICAN REAPER, GARDNER'S TURNIP CUTTER, SAMUELSON'S REGISTERED LAWN MOWER, PATENT LIQUID MANURE DISTRIBUTOR, WARNER'S GARDEN ENGINES, PUMPS, SYRINGES, &c.; FOWLER AND FRY'S CHAFF CUTTING MACHINE AND ONE ROW TURNIP DRILL, ANTHONY'S PATENT AMERICAN CHURN, AND PARKES' STEEL DIGGING FORKS.

Descriptions are also given of the New CHINESE POTATO Dioscorea Batatas) and the FLUKE KIDNEY POTATO, a sort highly recommended in the Midland Counties.

At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It contains 28 folio pages, "Chronicle" size.

Copies can be procured, price 6*d.* each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the

LONDON PUBLISHING OFFICE, 294, STRAND;

Or from the Proprietors, WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

GRASS SEEDS.—CARRIAGE FREE.

PERMANENT PASTURE GRASS.—*The very best Selections can be obtained from* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth,—all new and carefully selected, from 24s. to 30s. per acre.*

ORNAMENTAL LAWNS, PLEASURE GROUNDS, &c. The choicest varieties for producing a fine sward for Lawns and Pleasure Grounds can be procured from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, at 18*s.* per bushel, 2*s.* 6*d.* per gallon, or 1*s.* per lb.

RENOVATING GRASSES—for sowing over land deficient of plant—can be obtained at 9*d.* per lb.

A complete descriptive List of Grasses will be found in "RENDLE'S FARMING PRICE CURRENT," *and some valuable Tables, and other information relative to the best varieties for certain Lands and Situations.*

Apply to WM. E. RENDLE & Co., Seed Merchants, Plymouth.
ESTABLISHED SEVENTY YEARS.

SUTTON'S LAWN GRASS SEEDS,
AT THE CRYSTAL PALACE, SYDENHAM.

SUTTON AND SONS *have had the honour of supplying to the Crystal Palace Company the Grass Seeds by which so many acres of Arable Land have been converted into the beautiful Park and Lawns, now so much admired at Sydenham.*

The following letter has been received, besides many others:—

From Professor Lindley, Horticultural Society, 21, Regent Street, London.—"We have already made trial of your Lawn Grass Seeds, and it is only justice to say that they have proved the best we have sown for many years."

Price 1*s.* per lb.; 2*s.* 6*d.* per gallon; or 20*s.* per bushel. Quantity required for forming new Garden Lawns, 2½ bushels, or 50 lbs.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

TO WHEAT GROWERS.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, Edinburgh and London, have received from North-West America a small quantity of two new kinds of WHEAT, which they are sending out in packets containing 200 grains. One kind is named Club-headed, cultivated by the old Californians. The yield is said to be very large, and forms a very beautiful delicate-coloured sample. Price 20*s.* per packet, containing 200 seeds.

The other kind is evidently a variety of Triticum durum, with solid stalks. It is very early, and well adapted for spring sowing. Price 15*s.* per packet, containing 200 seeds.—Orders may be sent to PETER LAWSON & SON, in Edinburgh; or direct to their London House, 27, Great George Street, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq. | William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S. | Sir S. M. Peto, Bart.
Henry Currie, Esq. | William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq. | William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

CHEMICAL AND METALLURGICAL LABORATORIES.

THE ROYAL COLLEGE OF CHEMISTRY (now the Laboratory of the Metropolitan School of Science applied to Mining and the Arts) is open, under the direction of Dr. HOFMANN, F.R.S., and the Metallurgical Laboratory under the direction of Dr. PERCY, F.R.S.

At both of these Laboratories there are three terms annually of 12 weeks each. The fee for working every day in the week is 10*l.* per term, but Pupils may enter for half times at reduced fees.

The Third Term will commence on MONDAY, the 2d of April, when Pupils may be entered.

For further particulars, apply at the Museum of Practical Geology, Jermyn Street; or at the Royal College of Chemistry, Oxford Street. TRENHAM REEKS, Registrar.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—Prize Sheets for the CARLISLE MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

The Agricultural Gazette.

SATURDAY, MARCH 24, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, March 28—Agricultural Society of England.

THE agricultural relations of the subject of TOWN SEWAGE were very fully and instructively discussed last Monday evening, before the Society of Arts. Reports of some of the addresses delivered on that occasion will be found in another page; a full pub-

lication of the debate would occupy greater space than we can afford in a single number; and its postponement in part is the less to be regretted as the subject is not, like many others, one on which an immediate decision would at once affect farm practice. In fact the general tendency of increasing knowledge on the subject seems to discourage expectation that farm practice will ever largely benefit by the use of town sewage. Professor WAY has indeed shown how the conservative powers of ordinary soils would make them store-rooms of fertility, in which the food of plants might at any season be safely placed against the season of growth, when alone it can be used—but in sewage this food, it seems, is so greatly diluted that, however efficient a vehicle for it water may be, the manure which it thus conveys is pretty much as expensively conveyed as guano would be if a whole train of carriages were needed for the delivery of every ton. The question is, no doubt, as Mr. CAIRD has stated, now one more for the engineer than for the chemist. So far as the latter is concerned, it seems to be exhausted; but we fear that the problem, however simply now it may be stated, is as far as ever from a profitable solution.

We hope next week to give a further report of the discussion.

A VERY seasonable and useful discussion took place last week before the Highland and Agricultural Society of Scotland on TOP-DRESSINGS FOR DIFFERENT CROPS. Two papers were read—one by Mr. HOPE, of Fenton Barns, and the other by Mr. FINNIE, of Swanston—and Dr. ANDERSON, the chemist to the Society, summed up the points which had been brought out, and read the experience that had been described, in the light of that general experience which, when classified and arranged, is called science. One cannot imagine a more satisfactory and appropriate employment for an agricultural society than that in which the Highland Society was thus engaged. Its best practical men, instructed by its chemical officer, had brought their practical skill to bear upon a point of great practical importance, and the results of their experiments ascertained with carefulness are now published just at the time of year when likely to be most useful, and published along with suggestions by Professor ANDERSON, directing attention to such of the results made out as appear to one of his experience in experimental research to have been determined. Mr. RUSSELL, of Kilwhiss, in Fifeshire, had also contributed similar results with those of Messrs. FINNIE and HOPE, but his absence in America had interfered somewhat with their parallelism with the others, so that they could not so satisfactorily be presented in the same series.

We have not space for publication of the separate papers that were read; but their results we take from Dr. ANDERSON'S remarks, in which they have been compared. These remarks, it should be stated, specially directed attention to Mr. PUSEY'S view of the relative value of guano and of nitrate of soda as manures, and it was shown that in the experience of the Scottish experimenters that view was not borne out—guano being the more efficient of the two.

The experiments originated in a correspondence between Dr. ANDERSON and the three gentlemen we have named, in which the nature of the experiments was resolved upon: it was determined that nitrate of soda should be used at the rate of 1 cwt. per acre, and that sulphate of ammonia and Peruvian guano should be used in such quantities as to supply the same amount of nitrogen. It was further resolved that a mixture of these manures should also be used. One other point seemed worthy of inquiry. It has recently been customary to mix nitrate of soda with common salt, which is said to strengthen the straw, and prevent the tendency to lodge, which is frequently observed where light manures have been applied to grain, but as doubts have been expressed on this point, it was thought well that these manures should be tried both with and without salt.

On the last of these points it is sufficient to state that, comparing the two halves of all the experiments, over one of which the salt had been used, while over the other it had not, the conclusion arrived at is, that it was without effect, or at least that its influence was very uncertain.

The real point determined by these experiments is thus limited to their comparison of the nitrogenous manures, and here we simply present to the reader a somewhat condensed report of Professor ANDERSON'S remarks:—

On Wheat.—In Mr. FINNIE'S experiments there is remarkable similarity throughout the results. If we add together the quantities of good and weak grain, and, further, take the mean of each pair of experiments, with and without salt, we have the following table:—

	qrs.	bu.	lb.	qrs.	bu.	lb.
Nitrate of soda	5	8	47	5	4	30
" with salt ...	5	5	14			
Sulphate of ammonia ...	5	4	56	5	3	29
" with salt ...	5	2	14			
Peruvian guano	5	6	30	5	4	60
" with salt ...	5	2	60			
Mixture	5	5	37	5	4	16
" with salt	6	2	52			

We perceive at once that guano has given the largest return, next to it comes the mixture, and third only is nitrate of soda, *with salt*. The second column, giving the average of each pair, shows that though Peruvian guano stands highest, nitrate of soda is little behind it, while sulphate of ammonia falls short by more than a bushel. This difference is so small, however, as to be unimportant.

Turning to Mr. Hope's experiments, we find the results somewhat different, for, with him, sulphate of ammonia has given the highest result, while guano and nitrate of soda are nearly on a level. In Mr. Hope's experiments, we have the advantage of being able to compare the produce with that of an unmanured portion, from which we are enabled to calculate the actual profit derived from each manure. I shall select the highest result afforded by each manure, which is most favourable to nitrate of soda, and we obtain the following table, Wheat being taken at 70*s* per qr.:—

	Increase per acre.	Increased val. of crop.	Cost of manure.	Profit.
	Bushels.	£ *s.* *d.*	£ *s.* *d.*	£ *s.* *d.*
Nitrate of soda and salt	3	1 6 0	1 0 0	0 6 0
Sulp. of ammonia and salt	5	2 3 9	0 13 6	1 10 9
Peruvian guano ...	3½	1 10 0	0 14 0	0 16 9

It follows, therefore, that while sulphate of ammonia has given a profit of 30*s.* per acre, nitrate of soda has given only 6*s.*, and nitrate of soda employed alone gave an increase of only 2 bushels per acre, value 17*s.* 6*d.* entailing a loss of 2*s.* 6*d.* per acre.

In Mr. RUSSELL'S experiments, where the produce of Wheat from the unmanured portion is very small, being only 3 qrs. 3 bush. per acre, the effect of the top dressings is more marked than either in Mr. FINNIE'S or Mr. HOPE'S, and in them guano holds the highest place, while nitrate of soda stands low. It gives a profit calculated on the same manner as before, but taking the Wheat at the value of 72*s.* as given by Mr. RUSSELL of but 7*s.* 9*d.* per acre, while sulphate of ammonia gives 2*l.* 9*s.*, and guano 3*l.* 7*s.* per acre. As far as the production of straw is concerned, Mr. FINNIE'S results are most favourable to nitrate of soda, Mr. HOPE'S to sulphate of ammonia.

On Grass.—Turning to the hay experiments, we find matters more favourable to nitrate of soda. Mr. HOPE finds that it produces on the average an increase of 12 cwt. per acre, while guano only gives 9 cwt., and sulphate of ammonia 7 cwt. It is worthy of remark, however, that guano conjoined with salt gave a higher result than nitrate of soda, but when employed alone its effects were greatly inferior, and hence the difference in the average. Mr. FINNIE'S increase is 17 cwt. from nitrate of soda, 14 from sulphate of ammonia, and only 10 from Peruvian guano. Here guano falls decidedly short of the other ones, while taking into account the relative costs of the two manures, the nitrate and sulphate of ammonia leave about the same profit.

Mr. FINNIE has calculated the money value of the hay crop at 7*d.* per stone, and it thus appears that the portion dressed with nitrate of soda alone gives an increased value of 1*l.* 8*s.* 7*d.*, but when common salt was added it was only 1*l.* 4*s.* 4*d.* Taking the average of the two, we have 2*l.* 4*s.* 1½*d.* as the profit; which considerably exceeds that of the other manures. Mr. HOPE'S experiments afford similar results with nitrate of soda, the profit is 1*l.* 18*s.* 8*d.* per acre; with sulphate of ammonia, 1*l.* 2*s.* 2*d.*; and with Peruvian guano, 1*l.* 11*s.* 10*d.* In Mr. RUSSELL'S experiments guano gives an increased amount of hay, the value of which, deducting the cost of the manure, is 12*s.* 10*d.*; nitrate of soda gives 1*l.* 0*s.* 8*d.* profit; and sulphate of ammonia, 1*l.* 7*s.* 2*d.* On Grass the results are on the whole more favourable to nitrate of soda, but they by no means give it that pre-eminence which has been lately assigned to it.

On Potatoes.—The results obtained from Potatoes are unfavourable to nitrate of soda, but considerable discrepancy exists between Mr. HOPE and Mr. FINNIE'S results. Calculating Mr. HOPE'S at the rate of 3*s.* per cwt., we find that, after deducting the cost of the manure, the profit is 10*s.* per acre, while sulphate of ammonia gives 1*l.* 8*s.* 6*d.*, and Peruvian guano entails a loss of 7*s.* In Mr. FINNIE'S experiments, sulphate of ammonia gives a loss of 14*s.* per acre, nitrate of soda a gain of 19*s.*, and guano a gain of 3*l.* 11*s.*

It is proper to add to this that the manures applied per acre were respectively as follows:—(1), nitrate of soda, 1 cwt.; (2), nitrate of soda, 1 cwt., and common salt, 2 cwt.; (3), 87 lbs. of sulphate of ammonia; (4), 87 lbs. of sulphate of ammonia and 2 cwt. of common salt; (5), 137 lbs. of Peruvian guano; (6), the same guano and 2 cwt. of salt; (7), a mixture of 37 lbs. of nitrate of soda with 29 lbs. of sulphate of ammonia and 46 lbs. of Peruvian guano; (8), the same mixture and 2 cwt. of common salt.

On the general value of these experiments, and on those circumstances under which they were performed by which this was affected, we quote Dr. ANDERSON further:—

Taking these experiments as a whole, it is obvious that they form a very important contribution to our knowledge of these manures, when used as top-dressings upon different crops. They cannot be considered as exhausting the subject, or that we are entitled to assert that in all cases similar results are to be obtained; but this much is clear, that the extraordinary pre-eminence assigned to nitrate of soda is far from being borne out. It is to be observed, however, that the season was dry, and on that account comparatively unfavourable to top-dressings. This circumstance would undoubtedly act prejudicially on all these manures, but less so in nitrate of soda than the others. We know that when sulphate of ammonia and guano lie for a considerable time on the surface before they are washed in by the rain that a material loss of their ammonia occurs. On chemical grounds we know that such loss is less likely to occur with nitrate of soda. We remark, also, that the greatest effect in many cases has been produced by sulphate of ammonia, while guano occasionally stands behind the other two. It must be remembered, however, that the experiments are incomplete, and that the effects upon the next crop may materially alter the relative position. Kuhlman found that guano differed from nitrate of soda and purely ammoniacal manures in the action which it exerted in the subsequent crops. He found that it produced a marked increase upon them, while the portions which had been dressed with nitrate of soda and sulphate of ammonia actually gave in the subsequent year a less produce than the unmanured portion. Should a similar result be obtained on the crops of this year, we shall at once see that our conclusions may undergo considerable modification, and that guano may come to stand higher than it at present does. Meanwhile while these manures are taken so as to supply the same quantity of nitrogen, we have evidence that there is no marked difference between them unless it be in the hay crop. There we find that nitrate of soda does undoubtedly produce a larger increase than either of the others, and this is in accordance with the observation frequently made of its superior effects on the Grasses. In other words, it produces a more powerful effect on the stems than the other manures, and this we see also in the Wheat, when a larger increase of straw is produced by it than by either of the other manures; but in the production of seed we observe that the advantage lies in some cases with sulphate of ammonia, in others with guano, while nitrate of soda is invariably inferior.

Our readers will agree with us that the thanks of the agricultural community are due to the gentlemen and to the Society who have thus called attention to facts so well determined on a department of farm practice which during the next few weeks will occupy so generally the attention of agriculturists.

YOUTH.—CRIME.—PUNISHMENT.

(TWO LETTERS)—No. I.

ONE fine afternoon, last autumn, a gentleman riding home saw a boy, at that time in his employment, earning his wages by knocking down Apples from a tempting-looking tree in a small orchard adjoining his garden. The lad was too busily occupied to notice the new arrival at the scene of his labours: the interview was inevitable: flight was vain: and a whip in the rider's hand. Boys will be boys, and men *will* forget that the remark once applied to themselves: so, whack! crack! down came the riding-whip twice upon the peccant shoulders, with the usual reprimandatory interjections for such cases made and provided. A most expressive shrug of the off-side shoulder, and a quick furtive glance curiously compounded of angry pain and intense deprecation of impending *number three*—arrested the whip-hand; and with that biting form of admonition which popular metaphor has likened to 'a flea in the ear,' the boy departed: and the rider.

Both, *in pain*. For, the excitement of the moment over, there was something in the appeal of that smarting look, and writhing figure that made me half disposed (for the writer was the rider) to throw the whip into the nearest pond, which chanced to be conveniently at hand. But why was this? Had I struck too hard? No; the whip was but a light one; the offence, and detection, complete; and I had—after the most approved fashion too—*punished* the little culprit.

I began to reflect, as I rode on, upon this thing 'Punishment.' Said I to myself —— but you shall see the soliloquy in result. I have already remarked it was a tempting apple-tree: (oh! those tempting Apples! what work they have played in history, sacred and profane! For aught we know, Troy itself might still be standing, strong and *safe* as Sebastopol, but for *one* of them!)—Well, under this same tree, before ten days had passed, I beheld another young marauder working away, as before. I was on foot this time; but before the little man, No. 2, could look round, the arm he was raising with might and main for 'another chip' dropped to his side, at the touch of a hand laid, very gently, on his shoulder.

"What, stealing Apples, my little man?"

A look of terror, and a burning blush, were the only answer.

"Why how comes this? Don't you know it's wrong to steal?"

No answer: but the same shamed and terrified look.

"Have you never heard that it is wicked to steal? Has your mother never told you this?"

The boy looked up somewhat re-assured by the words, or the tone, and in that peculiar way of children, so unthinking, often so touching, said—

"*Mother's dead.*"

"How long has she been dead?"

A pause: and then—"I doant know."

"And did poor Mother never tell you it is wicked to steal!"

A dull hang of the head: a long silence, and then a blubbering outbreak of tears.

Then followed a short lecture on stealing; a promise that I should watch him always, till by good behaviour he had wiped out this offence: that that was the only way to do it: and that by good character he might soon be able to earn the means to buy some apples of his own, &c.

Both these boys I see frequently. The one meets me with a cowering angry sort of look, as if I was a Dragon that he dreads, but should like to slay. The smart of the whip is not forgotten; the 'Punishment' has done its work. What that work is we will inquire presently. The other boy meets me with a sort of under-glow of countenance, solicitous of notice; evidently with a sense of pleasure: he knows not why, of course, but with an indistinct association of my look and voice with '*poor* mother.'

Now, without going the length of assuming that all boys caught stealing would blush extempore, and hang their heads, and cry; or have that sad startling answer —"Mother's dead!" I would ask you, Madam or Sir, to "look on this picture, and on this," and say which of these two modes of treating juvenile crime, is the one most likely to *cure* it, and to protect us from it—the first, or *punitive* system, or the second, the 'reformatory' system?

'But Crime must be 'punished!'

'With what view!'

'Oh! to prevent it, of course.'

'But how does the Punishment of the Criminal prevent Crime?'

'By the example, doubtless, to other offenders.'

'Then it is not on the 'tit for tat' principle that you'd inflict it; not to avenge it upon the individual?'

'Certainly not: it is inflicted in order to deter others from repeating the offence; that society may be protected from depredation and assault, from "injury to person and property."'

Such is the answer. It has stood good for some hundreds of years: mayn't one say *thousands?* The 'British Constitution' is a chicken to it. It is older than the Pyramids: almost *really* "as old as the hills!" At least so all people say, and most people think. A solitary rider on a still autumn evening, of the year of grace 1854, with a flushed cheek and a shaking hand, as this thought passes through his mind, draws in a long breath between his closed teeth, as if it was some plaister for the heart-burn, and when he can draw in no more, dares to ejaculate it all—breath, thought, words, authority, antiquity, British Constitution, and I don't know how much more, in this hot short phrase—

"This 'Punishment!' This hateful PUNISHMENT!"

I know not how or why it is, that when one's thoughts are strongly excited, and most especially if the burning ember of *compunction* is thrusting its red-hot end into the Council that sits under the waistcoat-buttons,—an odd phenomenon is apt to occur: floating sentences or phrases long ago familiar, yet never *marked* till now, drift unwittingly across the recollection,—vaguely, lightly, suddenly, like an air-borne leaf across the face in winter, some Cumæan leaf that has lost its place and parentage, that bloomed far back in forgotten summer, and far away from the spot where now, bat-like, it flaps across you. What is it that brings those morsels of memory so oddly obtrusive yet so curiously a-propos, across the mind in its distress, uttering the very words, so that one rather seems to *hear* than think them!

"*And God put a mark upon Cain, lest any one finding him should slay him.*"

Such were the words that alighted impromptu, and kept repeating themselves, as it were, over and over again, as I rode home, swung myself into my study, closing the door behind me.

"This Punishment! this hateful *human Punishment:* is it RIGHT?"

I took down a volume of Blackstone, that most eloquent and satisfied of 'Commentators' upon Things that *be*, or that *once did* be; whose pleasant ample portrait smiles, in the old editions, opposite the title-page of what is now a charnel-house of dead Law. Caught by an old pencil-mark in the margin, my eye fell upon the following passage—

"For, every human law is only so far just and *efficacious*, in proportion as it is founded on the Laws of Nature."

Admirable! said I. Come, here, at least, is a proposition that needs no argument or proof. This is the right track! this *must* lead 'out of the wood.' I begin to think I see daylight already.

'Punishment.' 'The Laws of Nature.' 'Human law.' I regularly laid it out, and *stated it;* like an equation. It almost seemed as if it would *work!*

The Laws of Nature! blessed, beautiful, merciful Nature! fresh, fresh every morn and every 'dewy eve' and every hour and every instant, from the living hand of the Living God!——Well done, robed and ermined Justice Blackstone! For that one gem of a sentence I'll forgive you all the dusty toil of by-gone days through those four volumes octavo, all those bones and heaped-up skulls of dead and buried legislation from which my marvelling mind kept drawing conclusions most forbidden,—to find, at the end of all, at the last round of the ladder, that 'the climbing of it was indeed a useful practice for beginners, and that I must now kick it down behind me, and begin to study the Laws of England *as they are*'!

'The Laws of Nature!' And what, then, says Nature about Natural '*Punishment*?' Let us humbly examine the question; and look into it carefully, unflinchingly. Let us lay this hideous thing Punishment under the dissecting-knife, and probe into the very essence of its nature. What *is* it?

The child, not yet able to walk or speak, puts its finger into the candle: it burns: in an instant the arm is drawn back with an instinctive jerk. There's a roar: an angry look at the unconscious mutton and its pointed tongue of flame, and (with perhaps an occasional repetition of the *warning*) the child grows to manhood with two hands having upon each a thumb and four fingers, instead of two mutilated dedigitalised stumps.

The schoolboy—but who on earth is to follow *him!* At every hour, at every game, at every jump, at every trick, he is trying and testing and proving, and torturing if he could, the 'Laws of Nature.' No dashing French cavalier galloping round the serried phalanx of a British 'square-for-cavalry' ever tried with more daring and dauntless cunning to find out *one* unguarded spot. In vain! Nature hedges him around with her chevaux-de-frise of *warning* pains and penalties, sometimes mild, sometimes sharp, always proportionate to the invasion, always *discriminate* to the offence, always alighting on the exact transgressing member. She bites him, burns him, kicks him, scratches, pinches, bruises him. There is not a trick he can put upon her, but she has a trick in return; yet she never for an instant loses her temper. It is all *his own* act and deed producing *its own* certain and cognate result. 'Punishment it is absurd to call it: it is simply an educational experience of physical *causes and effects.* By it he learns: by it he is warned, guided, *preserved* to manhood.

The youth enters upon a deeper course of lessons. The physical Laws of Nature with their physical *warning* of pains and penalties, on one side, and rewards and pleasures on the other—that fair hedgerow of joyous flowers and prickly brambles lining on each side the road of safety—swell into richer hues, caught from the *moral* world, and protected from rude invasion by thorns of deeper smart on the way-side of Duty and Happiness. Yet all in *warning* mercy still! The midnight revel and excess followed by the waking agony and depression corresponding *to the very cups*, varying in intensity with the very number of the stupid 'toasts'—all with such an exactitude, such a *Minié* precision of cause and consequence, that almost an idiot might learn!

The grown-up man—but is it necessary to pursue it further? the dyspepsia of the glutton, the ennui of the idler, the gout, and other mystic inward gravelings of Mr. Sober Excess, the poverty of the slothful man, the isolation of the selfish man, the fever that penetrates the inner chamber of the careless neglecter of his penury-and-disease-stricken neighbours—are they 'Punishments' or *Warnings?* Look at them well: compare them with the gentle flame that checked the errant finger of the little child; you will see the same principle and kindly purpose running throughout; the Law of *Motive* and of merciful guidance and protection to *the individual.* As well might the spur that pricks the speed of the charger flying from certain death, as well might the knife that cuts away the mortified part of a diseased limb be called 'Punishment.'

In the sense that criminal-law-makers attach to the word, and have taught men to understand it, the laws of Nature exhibit *no such thing* as 'Punishment.' From first to last the whole 'criminal code' of Nature is simply and emphatically *prospective, reformatory,* and *parental,* acting upon the external and the physical, and still more potently and keen, with the tooth that *is not seen,* upon the internal and moral feelings of the individual. And if teaching such as this, so kind yet never disguising truth, so gentle yet never relaxing effort, keen in presence and perception, *constant* as his own shadow in its attendance upon each individual, often fail to teach,—what shall we say of the presumptuous hand which attempts by 'examples' of human 'punishment' to prevent the crimes *of others?*

The whole idea is a mixture of error and injustice: *of error* because it is ethically false to the constitution of human nature to suppose, or to make laws on the supposition, that punishment can generate vicarious motive or morality, and thus extinguish future crime; *of injustice,* because no human power or human laws have the right to make men into the scarecrows of hypothetical offences of others, not yet committed, any more than into scapegoats of the past offences of others, with whom the offender himself has no relation past or future, and for whom he is not and cannot be responsible.

Where did legislators get the preposterous notion of this *transitive* operation of Punishment from the thief in *esse* to the thief in *posse?* Upon what 'discourse of reason' was the theory based? The practical experience of the whole history of Crime in this country flatly contradicts it, and condemns it, as false to human nature. When men were hanged for horse and sheep stealing, the number of sheep and horses stolen was far greater (and from a smaller population) than since it has ceased to be a 'hanging' crime: the same is true of all.

But would not common sense and common sanity of argument require that before you assume that the punishment of A. who has committed a crime, will operate to the prevention of X. who has committed none at all—that you should first of all be able to show some evidence of its salutary influence upon A. himself? If the tramp! tramp! all day up the interminable staircase of a *grist-less* Mill, and the turning of a crank (that is grinding *nothing!*)—be found to harden the heart that wants softening, and blister the hand and its truest instincts with oh! such a sacrilegious mockery of Heaven-born LABOUR, all in vain, is it reasonable to assume that the effects upon *paulo-post-futurum* transgressors who 'may, can, might, would, could, should, *or ought to*' sin, subjunctively,—will be more successful? Do Grapes grow on Thorns, or Figs on Thistles, inside the garden-walls of a Goal?

If not—if the antiquated fallacy of severe punishment on guilty A. to terrify innocent X. from uncommitted crime, be simply a blunder equally against true justice and the true philosophy of human action—and if the idea of individual vengeance have been long ago rejected and disclaimed by our criminal code—what, then, is the true practical doctrine of 'Punishment?' What ought it to be? What is the right of Society against those who have wounded her peace, outraged her in property or person, transgressed her laws? Let us give this practical question a really practical investigation—not through the narrow lens of 'eye-for-eye-and-tooth-for-tooth' legislation, not through the miserable fallacy of 'example-punishments,' to be hereafter known as the exploded '*scarecrow* theory'—but by the broad and free light which lighteth every man if he will only come to the Light, and read the Laws of Nature as revealed and interpreted by One who was patient to be called the 'Friend of Sinners.' *H.*

Home Correspondence.

The Meat Manufacture.—In the interesting paper on "Italian Rye-grass," read by Mr. Morton before the London Farmers' Club, which appears in your *Gazette,* March 10th, in describing the produce under the irrigation system, page 154, the following observation occurs: "When Rye-grass is cut young, it contains with more of water more of the substances corresponding to the gluten of flour, which chemists tell us resemble the fleshy parts of animal matter. Those who wish to make flesh by consumption of Italian Rye-grass may therefore be right in cutting it frequently, and having it younger," &c. If by "making flesh" Mr. Morton means "fattening" or beef making, and that protein or albuminous compounds are more essential for fattening than for milk, I may hope for space to explain my grounds for a different conclusion. When cows are in full milk soon after calving, they will give 16 quarts per day. I have now five on hand which are giving this quantity on the average, and are apparently maintaining their weight and condition. An analysis of milk of standard quality shows a proportion of solid or dry mater al of 5 lbs. in the 16 quarts of milk per day, of which 2 lbs. will be casein or pure curd. If we assume the materials of food rich in protein, such as Beans, oilcake, &c., to contain 25 to 33 per cent. of this, it will appear that the 2 lbs. of casein or pure curd will represent the protein of 6 lbs. to 8 lbs. of Beans, oilcake, or other substances equally rich in protein; or, in other words, a daily supply of this quantity of Beans and oilcake will be required to produce the 5 lbs. of casein or pure curd. My cows giving 8 quarts per day increase in weight on the average, and for a length of time, 7 lbs. to 9 lbs. each per week. This produce of milk and gain of weight will represent the protein compounds of 3¾ lbs. to 5 lbs. of Beans, oilcake, or other materials equally rich in protein. The experience of feeding or fattening shows that a gain of 14 lbs. per week, or 2 lbs. per day, to be as much as can be relied on as an average for a length of time. If we consider ½ lb. per day as fat, which is probably not more than the actual proportion, there will be 1½ lb. for flesh, of which the fibrine, reckoned as dry material, will be less than ½ lb., and will represent the protein of 1½ lb. to 2 lbs. of Beans, oilcake, or other materials equally rich in protein. It will be observed that I have treated only of the quantities of protein compounds carried off in milk, or assimilated in increase of beef, and that each class of animals will require beyond this what is adequate to maintain their condition. Experience affords a tolerably safe guide to estimate the quantity required for this purpose. In the Turnip districts it is found that with 120 lbs. of Swedish Turnips per day, a fair-sized beast will maintain its condition for a length of time. In the district of Craven, in Yorkshire, where hay is the staple food, 1½ stones of meadow hay are found to maintain the condition of a like-sized animal. These quantities, which supply bulk with elements of respiration, correspond in their contents of protein compounds, and represent those in 6 lbs. to 8 lbs. of Beans, oilcake, and other substances containing 25 to 33 per cent. of protein. As a feeder supplies for purposes of bulk and respiration substances richer or poorer in protein, he will have to lessen or increase his quantity of these auxiliaries. It is of the utmost importance in the treatment of cattle, as also of plants, to afford an ample though (on consideration of cost, if not of effect also) not excessive supply of the elements of food, whether mineral or organic, suited to their requirements, and constitution, and purposes; on our ability to effect this depends, in a great degree, our measure of success. The milch cow may be said to have a twofold occupa-

tion in using her food—the production of milk and the maintenance of her condition. The former is the favourite one; if the food supplied be inadequate for both purposes, the defective elements are diverted to the milk, in which she strives to maintain the natural proportion of constituents, at the expense of her flesh, fat, and probably also of her phosphates or bone material. This we see daily exemplified in the dairy cows kept near large towns, which are bought in full condition, and after undergoing a course of milking, are sold off, greatly reduced. I am clearly of opinion that hitherto, in philosophy as well as in practice, the value of substances, rich in nitrogenous or protein compounds, has been under estimated, and too little of them used as auxiliaries for food, for cows giving milk; whilst for purposes of fattening have been too much relied on, and used too freely. *Y.*

Societies.

Society of Arts, *March 8 and 19.—On the Sewage of London.*—The agricultural relations of this subject were discussed more fully on the second day devoted to its consideration. The discussion, as reported in the Journal of the Society, extends to an unusual length, and we can find room for the remarks of only two or three of the speakers. The general scope of the debate, along with a condensed report of two or three more of the speeches that were made, we hope to give next week.

Professor Way stated that from the great pains and trouble which Mr. Lawes and his able coadjutor Dr. Gilbert had taken, as well as from his own experiments on this subject, that there could now be no doubt as to the composition and value of sewage. Mr. Lawes had arrived at the same results which, by a different road, he (Professor Way) arrived at some two or three years ago—that was—in determining the value of the sewage by a direct reference to the composition of the excrements, and within a very trifle the results which he arrived at agreed with those of Mr. Lawes. Mr. Lawes had found that 2 ounces of solid matter were daily ejected by each individual of the population—taking males and females and people of all ages and classes together; and that three and a half tenths of nitrogen were ejected in the same matter. He (Professor Way) found it to be 2¼ ounces as against Mr. Lawes's 2 ounces of solid matter and [illegible]ths of an ounce of nitrogen, which within a minute quantity agreed with Mr. Lawes's results. He thought, therefore, the question of the average composition of sewage water was set at rest, and that so far the subject was exhausted; for when two persons came nearly to the same point by different results, he thought it might be considered that they had arrived at truthful results. If, therefore, he agreed with the data of Mr. Lawes, he could not hesitate to agree also with the general conclusion as to the gross value of sewage water. He also agreed with Mr. Lawes that solid manure could not be profitably made from sewage. He regretted to have to state an opinion of this kind, when adverse to the interests of the many persons engaged in trying to make solid manure from that source; but at the same time he thought it did not become any one whose opinion was of any weight at all to allow people to go on with those schemes when their success was opposed to all knowledge and experience on the subject. He therefore said unhesitatingly that any existing plan for the production of solid manure from sewage water would be a failure. He said this from a knowledge of the fact, that of the valuable matters contained in sewage water nine-tenths exist in a liquid state, and these could not be separated by any known process of filtration, nor could they be precipitated by any substance which they had at present at command. Taking it for granted, then, that sewage must be supplied in a liquid condition, there were two principles to be borne in mind. One was that the proper place for its application was not necessarily or usually the land to which it naturally flowed. In nine cases out of ten these were heavy clay lands, which did not require sewage. If well drained they would be naturally rich lands, and if not drained sewage could not be applied to them. But the lands which required sewage were those high-lying, or comparatively high-lying, lands, in which there was a fair admixture of sand and gravel, which would take in the sewage and allow it to pass through. He did not mean to say any sandy soils, but lands of a medium character, which benefitted by manure of all kinds; and, therefore, he said that they should endeavour not to go to the natural outfall, but to produce an artificial outfall, if that could be done at a moderate and reasonable amount of expense. It was the proper plan to pursue, and in so doing a more extended area was obtained for the deposit of the sewage. It had been stated in the course of this discussion, and he had elsewhere been informed that the pumping of a quantity of 80,000 gallons of water could be done for a shilling, raising it 100 feet in height. This was stated in one of Mr. Chadwick's reports. Now, if every person consumed 25 gallons of water per day, that would amount to 9,000 gallons a year for each individual. If the urine and fæces of 10 people were put upon an acre of land, 80,000 gallons would represent that quantity. These 80,000 gallons would be raised to the higher level of 100 feet at the expense of 1*s.*, and if twice or thrice that quantity were allowed, 2*s.* or 3*s.* only would be the additional cost of manuring an acre of land at a high as compared with a low level. He therefore would say, let it be their object to seek the high-lying land. Then he would say again, a great and an increasingly acknowledged principle was that they should manure the land and not the crop. It was not necessary, even in the case of liquid manure, that the crop should be on the land when the manure was applied. He believed there was abundant practical experience to show that liquid containing manuring qualities produced its effects twelve months after its application, although it might be supposed to have run through before the crop was put on. But they had independent evidence of that fact, and here he must be allowed to refer to his own investigations upon this subject. He had found that soils removed nearly every particle of manuring matter from solutions which were filtered through them, allowing the water to run away and leaving the fertilising properties in the soil, and this proved that liquid manure might be applied to the soil without fear of losing the fertilising substances which it contained, although no crop was on the land at the time, a view of the subject which tended very widely to enlarge the opportunities for the application of liquid sewage manure. It was not necessary to be applied to the crop on the land, but they might take advantage of any favourable opportunity that presented itself for putting the sewage on. It was not for him to say to what description of crops sewage could be most profitably applied. All he said was, they ought to apply it to the land, rather than to the crop when it was on the land. He thought at present that principle was not properly understood. He would say a few words as to the quantity to be applied per acre to land; he thought Mr. Lawes's estimate was excessive. He had said 10,000 tons of sewage ought to be applied per acre. This amounted to something like the excrement of 100 people; now if they made a calculation of the quantity of solid matter which 10 people would supply, they would find this would amount to twice the value of a good dressing of manure—that was, 10 people would, in a year, produce the ammonia and other matter equal to the fertilising value of between 5 cwt. and 6 cwt. of guano. He believed that manure was more effective in a liquid than in a solid state; and if they put on, as Mr. Lawes suggested, manuring matter equal to 2 or 3 tons of guano per acre, it would be wasting manure and doing harm rather than good. He repeated, he thought Mr. Lawes's estimate of the quantity per acre was much too high, and he thought it was a duty to the agriculturists to show that the sewage of a town could be profitably applied to a much larger area.

[The address of Mr. Scott we must postpone. It related to the alleged unwholesomeness, both to man and beast, of the irrigation method of applying manure.]

Mr. Caird considered the conclusion which the preceding speaker had arrived at, regarding the alleged unwholesomeness of Grass produced by liquid manure, to be without adequate foundation. Pleuro-pneumonia affected cows fed in every way. It had no doubt been most virulent in towns where the stock are crowded together and the air foul; but, on farms, he had seen it equally fatal whether the stock were fed on artificial Grass or natural Grass, whether forced by irrigation or pastured in the field. It seemed to be generally admitted that, with our present knowledge, it is impracticable to make a solid manure of high value from sewage, and the plan hinted at by Mr. Ward of separating the valuable portion from the rain water might be open to the fatal objection of so rendering the small sewers detrimental to health. Any result of that kind would be infinitely more injurious that even the total waste of the sewage under the present system. The conclusion seemed to be that the sewage of London possesses no money value except as a liquid manure. He was not aware of any facts yet published which showed that value satisfactorily. The report of the Board of Health, so far as he could recollect, gave many instances of the advantage of farm sewage but none of London sewage. If we take Professor Way's estimate of the solid and liquid excrements contained in London sewage, we find it to be one in 1400. If that one is equal in quality to Peruvian guano, then 140 tons of sewage would supply as much manure as 2 cwt. of guano, with the water to wash it in besides. Now this quantity at the price mentioned by Mr. Chadwick, 2*d.* per ton, costs almost exactly the same money as 2 cwt. of guano, viz., 1*l.* 3*s.* 4*d.* But the water itself is of very considerable value to a Grass crop in the dry months of summer. Is the one then, in sewage, equal in value to the same weight of guano? That is a point to be determined by analysis and actual experiment. If it can be satisfactorily proved, there cannot be a doubt of the agricultural benefit of London sewage so applied. Even should it be of somewhat less value, the water in which it floats may make up the difference. Mr. Pusey has shown the enormous produce his meadows in Berkshire yield by the application of water alone. In Ayrshire, Mr. Morton tells us, that the use of large quantities of water in washing in guano to Italian Rye-grass was found to give two cuttings instead of one where the same quantity of guano was applied dry. We all know the value of a shower of rain in dry hot weather, and if we had the power of throwing on something better than rain when we liked, it would be well worth paying for. But it may, no doubt, be said, why not use the water which you can get for nothing on your farm instead of paying for it? He had no doubt that this might occasionally be done with great advantage in washing in guano to Italian Rye-grass. But it could not be done for nothing. In a trial which he had made with horses, water barrels, and tank, he found that to pump, carry out, and apply liquid, at a distance of only 120 yards, cost 2½*d.* a ton. Now London sewage at 2*d.* a ton must be cheaper—for, guano pays to be washed in with 100 tons of water.

You have the cost of the guano, 2 cwt. at 11*s.* 6*d.*	£1 [illegible]
Cost of applying 100 tons of water by water-cart at 2½*d.*	1 [illegible]
Against 140 tons of sewage at 2*d.*	2 [illegible]
Showing a saving by the use of sewage of	1 [illegible]
(Provided the sewage is equally valuable in its results)	£1 [illegible]

The position of the metropolis and other large towns was highly favourable to the use of this manure, for, within a circle of 10 miles, the land is chiefly under Grass and market gardens, to both of which sewage manure may be applied with peculiar advantage. And when gentlemen spoke of the danger of using so large a quantity of liquid to crops, it was not considered that Italian Rye-grass, under this system, yielded five crops in a season, and could therefore absorb with advantage a much larger supply of liquid than a single corn crop. (Hear, hear.) He thought the solution of the question might now be said to rest with the engineer. If the engineer can construct his works so as to deliver sewage from hydrants in the farmers' fields for 2*d.* a ton, the point was gained. For even though the water had but a very small portion of actual manure, who would not, as he had already said, gladly pay for an abundant supply of water at certain seasons? An inch of rain in the end of May might save the hay crop; and, at 2*d.* a ton, this could then be had at a cost of 16*s.* 8*d.* The advantage of the water manure drill was well known in the south. Now, the timely application of a quarter of an inch of water, at a cost of 4*s.* 2*d.* an acre, might make the difference between success and failure in starting the Turnip crop. But let them not blame the stolidity of the farmers, as had been done by a speaker in the previous night's discussion, for any part of the failure of this system hitherto. It was quite a mistake to suppose that as individuals the farmers are averse to the introduction of improvements, or unable to comprehend their value, or incapable of appreciating their own interests. Let the gentleman who thinks them so simple try them by dealing with them. Look at the rapidity with which they adopted guano as a manure. In 1841 it was scarcely known: in 1845 nearly 300,000 tons, at a cost of 2 millions sterling, were used by the farmers of this country. Prove to them, as clearly as guano has proved itself, that you can give them a valuable manure for even less money, and you will have a demand larger than you can supply. (Cheers.)

[We postpone for a week the condensed report, which is all we can obtain room for, of speeches by Mr. Paine and other gentlemen who subsequently addressed the meeting.]

Mr. Wren Hoskyns confessed that, from the general testimony that had been elicited in the course of the debate, from practical and scientific speakers, both as to the precise value and the engineering availability to the agriculturist of sewage manure, the hopes he had always encouraged upon the subject had received less confirmation than the fears he had latterly been led to admit. Still, the problem appeared to him not without hope. And the ground upon which he founded it was this: that the problem had two heads to work it, two sets of shoulders to bear it—the agriculturist at the one end, and the sanitary commissioner on the other, both equally and interestedly bent upon its solution. "Nothing will ever be undertaken," says the poet Imlac to Rasselas, "if all difficulties must be first overcome." He felt an instinctive assurance that this subject would not end with this night's discussion; the question was too important, and the parties interested in it too many, to forbid the belief that further knowledge and research would be brought to bear on it, and further opportunity of its discussion afforded at some future day. He would admit that his mind was not unprepared altogether for the low estimate which chemical analysis had conclusively disclosed in the case of sewage manure. There were, it seemed to him, *reasons* calculated to mislead a judgment formed merely from the *physical sense*, as to the fertilising value of this manure. For obvious reasons no animal consumed so little food, in proportion to the living bulk, as man, whilst in no animals were the resulting organised tissue so important and *expensive*, physiologically speaking. Four pounds of new blood in the 24 hours (the quantity produced from the food of a healthy man), was a heavy *draw* upon less, on an average, than a pound of meat, with the relative proportion of farinaceous and vegetable food; and though from this, of course, a considerable residuum passed off in excretion, still, after due allowance for respiration and perspiration, the aggregate loss in the formation of new tissue suggested, *à priori*, ground for somewhat disappointing results in the agricultural value of the manure. In illustration of this Mr. Hoskyns referred to some recent experiments at the Hatton Lunatic Asylum, in Warwickshire, the sewage of which, when distributed over the surrounding soil, under local circumstances peculiarly favourable for the experiment, seemed to have produced results in no degree commensurate with the anticipations based upon the amount of the nuisance experienced prior to its utilisation upon the soil.

Reviews.

Agriculture, Past and Present. Being two introductory Lectures delivered in the University of Edinburgh. By John Wilson, F.R.S.E., Professor of Agriculture in the University of Edinburgh.

These lectures present, in a condensed, unpretending, and compendious form, first the history and next some

of the existing relations of agriculture. The former of the two is especially commendable for the exceedingly full, interesting, and well packed narration which it gives of the many steps by which agricultural progress has been effected, and which, though following one another often at long and tedious intervals, present nevertheless instructive relations when thus brought together. This lecture is certainly a satisfactory exception to the general, or at least the comparative, uselessness of dwelling on the history and maxims of the past in agriculture. There are in our current history instances more striking of agricultural intelligence and success, and in our current literature lessons, arguments, and illustrations drawn from all sources, and bearing with more living influence on our agriculture and our agriculturists, than those which one sees so often quoted from the Latin and the Greek. In the second lecture Professor Wilson relates the way in which chemistry, geology, botany, and meteorology are connected with farm practice, and the following are among his concluding remarks:—

"I have ventured thus to point out to you some of the more prominent features in the connection between these several sciences and that which I am appointed to teach in this university, because I believe firmly that they constitute the basis upon which agriculture as a science must stand. Holding that opinion, I have not disguised from myself the heavy responsibility of the duties I have assumed in attempting to teach a science involving such a wide range of knowledge, and I am free to confess that I look forward with some anxiety as to my capability for fulfilling them to my own satisfaction; for I do not forget that I am charged to uphold the intellectual interests of agriculture in this its acknowledged *capital*. But this anxiety is considerably lessened when I recollect that under *this* same roof each of these allied sciences, to which I, as a farmer, have already sworn allegiance, forms a distinct and separate study, presided over and taught by its respective professors. A knowledge of this relieves me at once from the weightiest portion of the responsibility, and encourages me to hope that I may be able so to make use of the knowledge which it is their province to impart to the student, as to render *my* task—that of establishing its relations with agriculture—a comparatively easy one.

Miscellaneous.

Agricultural Prejudice.—At first many of my neighbours came, when they saw the mode of deep tillage and frequent stirrings of the land I was practising, and very goodnaturedly warned me of what they considered the folly of my proceedings, and assured me that from their knowledge of the exhausted state of the farm I had entered on, if I did not cease my "book farming," and "let the soil rest," I would "break the heart of the land," meaning that I would destroy its fertility. As the result of my labours proved the falsity of their opinions, many, of whose judgments I had formed a more favourable opinion, have been forced to change the grounds of attack, and now assert that the system I advocate and pursue has been established by landlords for the purpose of keeping up high rents! This is the most unfortunate impression of any to get abroad; and I am sorry to say, groundless though it be, it is one that is very general. I do not believe it to be my province to enter further upon a question of this nature, nor attempt to point out how such a feeling is to be removed; still I think it right to state that such an impression exists, and seriously tends to impede agricultural improvement. *Mr. Healey's Report of Dressog to Dr. Kirkpatrick.*

Calendar of Operations.

MARCH.

CHESHIRE, *March* 20.—Since our last report the unusual severity of the weather has very much retarded all field operations, excepting carting out manure for green crops, &c., and it will require more than ordinary exertion on the part of both men and horses to bring up the arrears of spring work, and place the farmer in that position he would wish to be by the end of April. The frost has left the land in fine condition for working, and if the clay land is allowed time to dry before being trampled on by the horses, the work will be greatly facilitated, otherwise the benefit derived from the frost will be destroyed, and additional labour created. On some of the fine warm land Wheat sowing was resumed immediately on the disappearing of the frost, with great expectations of a full crop; but this practice cannot be considered general, many preferring Oats as a more certain crop. Swede Turnips, where left in the ground, have been much injured, and in many instances entirely destroyed by the frost, which has materially reduced the amount of spring food for the stock. Mangold Wurzel has kept well where the necessary precautions of covering with straw and soil in the pit have been resorted to. Winter Vetches have been cut severely, but are now recovering; it is, however, feared they will be much later than was anticipated. Where Summer Vetches have been sown by mistake, they are entirely destroyed, much to the annoyance of the parties sowing them, and we think persons supplying such seed knowingly ought to be made to pay for the loss and disappointment. Considering the severity of the winter, ewes have done better than we could have expected, and are now producing fine healthy lambs; this may be attributed in some measure to the dryness of the season, which is far better for sheep than a wet open winter. At the annual sales which are now held almost every week at one place or other throughout the county, stock of every description, but more especially fat stock, fetch high prices. The "pleuro-pneumonia" still lingers in some localities, but it does not appear to be of so devastating a character as formerly. *W. P.*

Notices to Correspondents.

TURNIP SEED: *J. H.* We suppose it impossible to be sure that two varieties of Turnips do not become mixed in growing on the same farm. You had better seed but one kind.

PELARGONIUMS,
FUCHSIAS, PANSIES, VERBENAS, ETC.

JOHN DOBSON AND SON having a large and healthy stock of the above, beg to offer them at the low prices affixed; the plants are all in the finest health and require immediate repotting.

PELARGONIUMS, fine named varieties, 12*s.*, 21*s.*, 30*s.*, 42*s.*, and 63*s.* per dozen.

PANSIES, a first-rate collection, 6*s.*, 12*s.*, and 18*s.* per dozen.

FUCHSIAS, 12 fine varieties, including Vanguard, Queen of Hanover, Duchess of Lancaster, Glory, Duke of Wellington, &c., 18*s.*; older varieties, 9*s.* and 12*s.* per dozen.

VERBENAS, the best of last season's English and French varieties, 6*s.* and 9*s.* per dozen. A general descriptive Catalogue of the above may be had for one postage stamp.

Woodlands Nursery, Isleworth.

NEW ROSES IN POTS.

WILLIAM WOOD AND SON have to offer fine Dwarf Plants of the following:—

HYBRID PERPETUALS.—	s.	d.
Baron Laray	7	6

N.B. The new Hybrid Perpetual Rose Emperor Napoleon I intend sending out in June, at 10*s.* 6*d.* each, orders for which are now solicited. A Descriptive List of the above New Roses can be had on application.

Carriage paid to any Station on the Eastern Counties Railway.

St. John's Street Nursery, Colchester.

SELECT NEW ROSES.

THOMAS RIVERS offers the following selection of New and Fine Roses, young healthy Plants, fit to plant out the end of April.

HYBRID PERPETUALS.

Baron Larrey, rose, shaded with carmine, 7*s.* 6*d.*
Belle Lyonnaise, nearly white, beautifully shaped, 7*s.* 6*d.*
Ciceron, marbled crimson, 5*s.*
Colonel de Rougemont, bright rose, Baronne Prevost, improved, 3*s.* 6*d.*
Comtesse Vaillant, deep crimson purple, 7*s.* 6*d.*
Deuil de Willermoz, very dark crimson, 7*s.* 6*d.*
Emperor Napoleon, brilliant glossy scarlet, large petals, a little more than semi-double, 7*s.* 6*d.*
Felicité Rigeaud, white, tinted with rose, 3*s.* 6*d.*
Georges d'Amboise, bright red, 3*s.* 6*d.*
Gloire de France, deep vivid crimson, large and fine, 3*s.* 6*d.*
Jules Margottin, light vivid crimson, a fine pillar Rose, 2*s.* 6*d.* to 3*s.* 6*d.*
Léon Haimann, brilliant glossy rose, 7*s.* 6*d.*
Lord Raglan, scarlet and crimson, larger and more brilliant than the Géant, 10*s.* 6*d.* [Roses, 5*s.*
Madame Hector Jacquin, bright rose, one of the largest of
„ Lacour Jury, delicate rose, tea-scented, 7*s.* 6*d.*
„ Masson, deep crimson red, large, 10*s.* 6*d.*
„ Place, delicate bright pink, most perfect in shape, 7*s.* 6*d.*
„ Theodore Martel, pale flesh, 7*s.* 6*d.*
„ Trotter, bright red, vigorous, a fine pillar Rose, 5*s.*
President Menoux, bright rose, cropped a seedling from Standard of Marengo, 7*s.* 6*d.*
Prince de Moskowa, dark crimson, 5*s.*
Rose et Blanche, bright rose with centre white, 5*s.*

TEA-SCENTED ROSES.

Belle de Moulins, pale flesh, very large, 5*s.*
Belle Laure, pale rose, large, 3*s.* 6*d.*
Censi Pourpre, crimson, 3*s.* 6*d.*
Gloire de Dijon, salmon, tinted with rose, the finest of Tea Roses, 3*s.* 6*d.* to 5*s.*, the latter one year old stout plants.
Louise de Savoie, fine sulphur yellow, large, 7*s.* 6*d.*
Madame Maurin, pale yellow, finely shaped, 5*s.*

NOISETTE ROSES.

Augusta, sulphur, large, finely shaped, 7*s.* 6*d.* to 10*s.* 6*d.*
Isis, pure white large, 5*s.*

PERPETUAL MOSS ROSES.

Celine Briant, bright rose, blooms freely in autumn, 7*s.* 6*d.*
Didon, pale flesh, finely shaped, 10*s.* 6*d.*
Madame Ory, bright rose, globular, large and very double, 15*s.*
Michel Adanson, brilliant crimson, 10*s.* 6*d.*
Salet, bright rose, large and double, the most vigorous of this group, 7*s.* 6*d.*

Carriage paid to London. The Descriptive Catalogue of Roses free per post. "The Rose Amateur's Guide," 5th edition, 3*s.* 6*d.* per post.—Nurseries, Sawbridgeworth, Herts.

GREAT NOVELTIES FOR THE ENSUING SEASON,
FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE, AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA

(The DOUBLE Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double Snowdrop, with rich scarlet sepals: altogether distinct from anything of the kind ever yet produced. Price 10*s.* 6*d.* each.

Together with a very beautiful new double Purple variety,

VIOLÆFLORA-PLENA,

Rich double blue corolla, resembling a fine double violet, 7*s.* 6*d.* each.

L., P., & Co. have also fine plants of the following choice kinds of Fuchsias at 18*s.* to 42*s.* per dozen.:—

Aspasia	Glory	Purple Perfection
Apollo	Lucretia	Sir Harry Smith
Brilliant	Orion	Sidonia
Duchess of Lancaster	Prime Minister	Sir Jno. Falstaff
Duke of Wellington	Princess	Telegraph
Dominiana	Kossuth	Resplendent.

They are also now prepared to send out their beautiful new

VERONICA KERMESINA,

Raised by that eminent horticulturist J. Luscombe, Esq., of Coombe Royal, who sent specimens to Dr. Lindley, at the time of its first flowering, who thus pronounces his first opinion of it:—"The variety sent with this was charming, a decided rose colour having mingled with the violet." See also notice of Dr. Lindley in the *Chronicle* for Dec. 2, 1854, as follows:—"L., P., & Co. Your V. Kermesina is a handsome dark variety of V. speciosa; its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite." Price 7*s.* 6*d.* each. A few extra-sized specimens may be had.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—ESTABLISHED IN 1720.

TO NURSERYMEN, SEEDSMEN, ETC.

MESSRS. E. G. HENDERSON AND SON having had (through their customers), a Seed Catalogue brought under their notice, and which seems to have been distributed throughout the whole of their connection, published by a very eminent and old established firm near London; and on referring to the same they find that all the Hardy Annuals from Nos. 1 to 308, the Half-hardy Annuals from Nos. 309 to 479, Hardy Biennials and Perennials from Nos. 480 to 660, and the Greenhouse Plants and Tender Annuals from Nos. 661 to 741 have all been copied from their lists, with the full descriptions of colour, height, treatment, and other information, even the numbers attached to each article correspond with the strictest accuracy. The only alteration is that no prices are attached, whereas, in the original catalogue every article is priced.

Messrs. E. G. H. & SON beg to say, that as they are at some considerable expense and trouble preparing and issuing their Catalogues throughout the year, they now give notice that in future they shall consider it very disreputable in any parties copying them in the style above alluded to, unless the source from which they derive their information is published at the time, or otherwise communicating with them previously to copying the same.

Wellington Nursery, St. John's Wood, London.—March 24.

MESSRS. E. G. HENDERSON AND SON having purchased of the late W. Story, Esq., of Newton, in the county of Devon, for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, a new feature in this tribe introduced by him, and in consequence of an advertisement appearing in the *Gardeners' Chronicle* from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, it was thought necessary, after a written communication with that gentleman, for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received in the month of November last Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of numbers of their customers having ordered plants at higher prices than are now quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to those purchased of Mr. Story.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

Per packet—	s.	d.
Antirrhinum, extra fine ...	0	6
Auricula, fine mixed ...	1	6
Abronia umbellata	1	6
Anagallis azurea grandiflora	1	0
„ rubra „	1	0
Arctotis breviscapa ...	0	6
Aster, new Peony pyramid, in packets of 10 distinct colours, separate ...	3	6
„ new bouquet pyramidal, in packets of 12 distinct colours	3	6
Balsam, double Camellia-flowered, in packets of 6 distinct colours, separate	3	0
„ new double Camellia Rose, in packets of 10 distinct colours, separate, extra fine	5	0
„ Aurora, new double crimson	1	0
„ new dble. pale yellow	1	0
Carnation, stage flowers...	1	6
Calceolaria, ex. ex. 2*s.* 6*d.* & 5*s.*		
Cineraria, ex. ex. 1*s.* 6*d.* & 2*s.* 6*d.*		
Chrysanthemum pompone	1	0
„ large flowered	1	0
Calendrinia umbellata ...	0	6
Dianthus Dunnetti, suprb.	1	0
„ Chinensis flore-pleno, extra fine...	0	6
Eschscholtzia tenuifolia...	1	6
Geranium, choice show ...	2	6
„ choice fancy	2	6
Hollyhock, first quality ...	2	6
„ second quality ...	1	0
Ipomœa rubro cærulea ...	1	0

Per packet—	s.	d.
Ipomœa limbata	2	6
Leptosiphon luteum ...	0	6
„ aureum	1	6
Linum grandiflorum rubrum 1*s.* 6*d.*, and	2	6
Lobelia Queen Victoria (scarlet)	0	6
Lobelia Roi Leopold ...	0	6
Larkspur, new double improved hyacinth flowered, in packets of 6 distinct colours ...	2	6
Limnanthes sulphurea odorata	1	0
Mignonette, new, large ...	0	3
Mimulus, beautiful ...	0	6
Pansy, choice show ...	1	6
„ choice fancy	1	6
Petunia, extra fine ...	1	0
Phlox Drummondi coccinea	0	6
Portulaca, new orange ...	0	6
„ new rose	0	6
Primula sinensis fimbriata, alba and rubra mixed ...	2	6
Poppy, new large Pæony, in 8 brilliant colours ...	2	0
Reseda myriophylla, new Mignonette	1	0
Salpiglossis, scarlet, blue, and sulphur	0	6
Stock, German, new large flowering, in packets of six distinct colours ...	2	6
Verbena, choice mixed ...	1	0
Sweet William, new double	0	6
Whitlavia grandiflora ...	1	6

Lilium giganteum seed, 2*s.* 6*d.* and 5*s.* per packet.
Holcus saccharatus (new Sugar-cane), 1*s.* to 2*s.* 6*d.* do.
Dioscorea Batatas (Japanese Yam), 2*s.* 6*d.* each tuber.
20 Ornamental Grasses (see Catalogue).
12 Ornamental foliage Annuals.

Their new Seed Catalogue, with full particulars of the above and many other novelties, is now ready and will be forwarded post free on application.

Wellington Nursery, St. John's Wood.—March, 1855.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done by any unskilled labourer, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. SAMUELSON, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.

NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.

Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.

JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, few doors east of the Pantheon.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to COTTAM & HALLEN, 2, Wimsley Street, Oxford Street.

WARMING AND VENTILATING.

NEW AND IMPORTANT LEVELLING INSTRUMENT.

GILLESPIE'S PATENT INCLINOMETER, for Taking, Fixing, and Adjusting Surface Slopes of Lands, Earthen Embankments, Railway Gradients, &c., and the Dip, Outfall, or Rise of Drains, Water Courses, &c., and universally applicable to determine the plans and aid the execution of all levelling or sloping operations known in civil engineering.

PRICES:—Inclinometer, with mahogany frame and brass mounting ... ... £3 3*s.* 0*d.*
Do. with oak frame and wrought iron mounting 2 12 0
Light Telescope, 10*s.* 6*d.* extra.

TESTIMONIALS.

From Mr. James Gentles, Contractor.—"I have for a considerable time past used Gillespie's Patent Inclinometer in extensive drainage operations carried on by me, and I have found it to be of the greatest service, in showing the minutest slope in the ground, and in saving of labour; and I could not have constructed many of the drains with any degree of accuracy without its assistance."—James Gentles, Hart Hill, by Whitburn.

Extract of a letter from John Mitchell, Esq., Stand Hill, Bathgate.—"I highly appreciate its capabilities as a levelling instrument. In level lands, where there is a difficulty in detecting in which direction the land slopes, it is invaluable."

Extract of a letter from Mr. John Turner, Surveyor, Whitburn.—"The more I have tested it the more have I appreciated its value. By this invention the power of levelling is brought within the reach of all men of ordinary capacity."

Sold by WILLIAM DRAY & Co., Engineers, &c., Swan Lane London. Specimens and Models may be seen at their Warerooms Also a Descriptive Treatise on the nature and uses of the Patent Inclinometer, and copies of Recommendations of its efficiency and value to be had on application.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.

2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	12	0
2½ in. long	ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4*s.* 6*d.* each; Four Tine Forks, 5*s.* 6*d.* each. A liberal allowance on Wholesale Orders.

WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

108, Newgate Street, and 52, Little Britain, London.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.—Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 108, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

FREDERICK PHILLIPS' PATENT.

THE PRIZE PULPING MACHINE of the Royal Agricultural Society's Show, held at Lincoln, July, 1854.

Of all the Pulping Machines which are before the Public, this is the only one which the Royal Agricultural Society certified as "**breaking the roots well,**"—**all others are certified as slicers** in their *Journal*, just published, page 373, also in the article on "Diminishing the Quantity of Roots in Fattening Cattle," page 490), and the great braggadocia "No Other," advertised week by week, although tried against that of F. P. and others, was not placed at all, in fact was "nowhere."

F. P. is happy to inform his numerous applicants for the Machine, that he has greatly simplified its construction without affecting its efficiency.

To be had of the PATENTEE, Brandon, Suffolk; of Mr. JAMES WOODS, Implement Manufactory, Stowmarket, Suffolk; or of the London Agents, Mr. WILLIAM DRAY & Co., Swan Lane, Upper Thames Street; or of Mr. MEDWORTH, Implement Department, Baker Street, Bazaar.

Price, with boarded floor, 6*l.* 10*s.*; do. without do., 6*l.*

(Fig. 1.) (Fig. 2.)

No. 12 „ 24 „	„ 45 „	...	5 0
No. 14 „ 30 „	„ 45 „	...	5 10

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for all the all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

WEEDS ON WALKS.

Camera Hills Bridge, Edinburgh.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address INGLIS & CHISHOLM, Charles Street, Garratt, Manchester.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which RICHMOND AND CHANDLER have attained in the manufacture of Agricultural Implements; and the recent improvements made upon their various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated) are of the highest value in the economical preparation of food for cattle.—Address RICHMOND & CHANDLER, Salford, Manchester; and South John Street, Liverpool. Catalogues gratis.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.
Priced Lists of Plant Tubs and Boxes forwarded on application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

NURSERY AND SEED BUSINESS,
ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.—Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO BE LET, for a term of years, and entered upon at Lady-day next, the FARM of TESTWOOD, in the Parish of Eling, in the County of Southampton. It consists of about 357 acres, of which 60 acres are excellent Water Meadow, 265 acres of excellent Arable Land, and 32 acres of Rough Pasture, which is to be converted into Arable Land. There is a good Farm House, and large commodious Farm Buildings. The Farm is about five miles from Southampton, and the turnpike road from there to Salisbury passes through it. It is within 1½ miles of Eling Railway Station and Wharf on the Southampton ride.—For particulars apply to Messrs. COXWILL & BASSETT, Southampton; or Mr. JOHN MORTON, Nailsworth, Gloucestershire. A person at Testwood House will be directed to show the Farm.

TO BE LET, for a term of years, from Lady-day next, a compact SHEEP AND TURNIP FARM, Seaton, near Axminster, on the South Coast of Devon, comprising a good Farm House, convenient Offices, and 2 5 a. 1 r. 34 p. of Land, of which 29 a. 1 r. is Meadow, 2 a. 3 r. 4 p. Orchard, 18 a. 2 r. 25 p. Pasture, and 154 a. 3 r. 5 p. Arable. The whole within a ring fence, and near good Market Towns and Seaports.—To view apply to Mr. THOMAS AYNSLEY, at the Farm; and for particulars, by letter, to Mr. BARRAGE, Nettlecombe, Taunton.—March 24.

KING'S COUNTY, IRELAND.

TO BE LET, with immediate possession, the DWELLING-HOUSE, OFFICES, and DEMESNE LANDS of COROLANTY, containing 100 acres, late Irish plantation measure, together with 50 acres of Bog attached, situate within one mile of the town of Shinrone, and five of Parsonstown and Roscrea, both first-class inland towns. The House, upon which a large sum has just been expended, is in perfect repair, and contains Breakfast, Dining, and Drawing Rooms, Study, eight Bed Rooms, Kitchen, and all necessary servants' apartments; attached are two large yards with extensive offices, as a large walled-in garden, well stocked with Fruit trees. The Lands are mostly of prime quality, well watered and sheltered, and well suited for all agricultural purposes. The neighbourhood is remarkably quiet and the public burdens very moderate. To a solvent tenant a long lease will be given; none other need apply.—For further particulars, apply to JOSEPH J. WALKER, Esq., Belfield, Shinrone, Ireland; or Mrs. PALMER NUNN, 13, York Terrace, Leamington, Warwickshire. The Caretaker residing in the house will show the Lands.

TO BE SOLD, for half their value, a nearly new SPAN-ROOFED GREENHOUSE, 30 feet 6 inches long; and a STOVE 23 feet 4 inches long, each 17 feet 9 inches wide, with a Glass Partition, including Hot-water Apparatus, Slate Shelves, Centre Table, Hanging Shelves, &c., complete. They are both first-rate Plant Houses, being constructed on the most improved plan.—Apply to J. LEWIS, Machine Hothouse Works, Stamford Hill, Middlesex.

TO BE SOLD, the BUSINESS, GREENHOUSES, PITS, FRAMES, and STOCK therein, containing a choice collection of plants in the finest condition; also the Lease of the ACACIA ROAD NURSERY, situated in the best part of St. John's Wood, and close to the Regent's Park. There is an excellent Residence, with Stable, Coach, and Potting Houses. Well worthy the attention of any person wishing to carry on the business. A part of the purchase money may remain on security if required. Further particulars may be obtained of the proprietor, ROBERT YEO, Esq., 10, Victoria Terrace, Belsize Road, St. John's Wood, London.

TO BE SOLD, by private treaty, a NURSERY and PLANT BUSINESS, established nearly 70 years. The Proprietor of this old-established Nursery Business is willing to retire, and dispose of the Stock and Good-will. The nursery comprises about 20 acres of ground, and about 15 large and commodious Stove, Greenhouse, and Propagating Houses, with numerous Pits, frames, &c. *The business is in full working order, and is capable of being increased to almost any extent, and of being made one of the best provincial nurseries in the kingdom.* The stock is in a flourishing condition, being young, healthy, and in good saleable order, and comprises a general assortment of all the most saleable Forest Trees, Shrubs, Fruit Trees, Stove, Greenhouse, and Miscellaneous Plants. The Nurseries are situated close and adjoining one of the largest towns in the West of England, with a population of more than 100,000 inhabitants. The whole of the land, houses, &c., belongs to the proprietor, *who will have no objection to grant a long lease to his successor or successors, and at least one-half of the purchase money could remain on security at common interest.* The business has been carried on with great success by the present proprietor, which partly contributes to his retiring from the business. None but principals and *bond fide* purchasers will be treated with.—Apply to Mr. WILLIAM E. RENDLE, Union Road, Plymouth.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill.
Illustrated Catalogues forwarded post free.

POULTRY.—Eggs of Brahma Pootra Fowls at 10*s.* per dozen; Buff and Partridge Cochin China, Dorking, Black Spanish Fowls at 5*s.* per dozen; package included. Also a few birds of each of the above and a pair of Golden Spangled Bantams on sale, at very moderate prices.—For particulars apply to AN AMATEUR, Matlock, Bath.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, March 29th, at 12 o'clock, about 200 Choice DOUBLE CAMELLIAS, from 18 inches to 5 feet, comprising all the approved kinds, beautifully furnished with bloom buds; also a superb collection of fine Hollyhocks from a celebrated grower; an assortment of choice American Plants, Standard and Dwarf Roses, Azalea Indica, Ericas, Fuchsias, Verbenas, Dahlias in dry roots, Pæonias, &c. May be viewed the morning of Sale.—Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

MR. ALEXANDER will Sell by Auction, at the Mart, near the Bank of England, on TUESDAY, March 27th, at 12 o'clock, a choice collection of CARNATIONS, PICOTEES, PINKS, HERBACEOUS PLANTS, STANDARD ROSES, and other TREES; also IRIS GERMANICUS, comprising all the show varieties.—May be viewed on the morning of Sale. Catalogues had at the Mart; and of Mr. ALEXANDER, Shacklewell.

MR. J. WILLMER will Sell by Auction, at the Auction Mart, Bartholomew Lane, on WEDNESDAY, March 28, at 12 o'clock, a choice collection of Carnations and Picotees, Pinks, Dahlias in dry roots, Pæonies, Climbing Roses in pots, &c.—May be viewed the morning of sale, and Catalogues had at the Mart, and of the Auctioneer, Sunbury, Middlesex.

TO GARDENERS AND OTHERS.

NORLAND TERRACE AND LANSDOWN ROAD, A FEW DOORS FROM THE UXBRIDGE ROAD, NOTTING HILL.

MR. HAWKINGS will Sell by Auction, on the premises as above, on WEDNESDAY, 28th March, at 10 for 11 o'clock, a quantity of Lights, Frames, Frame-work fixed to wall, Stages and Pits, Flues and Brick-work, Plants, Pots, Herbs, Manure, Mould, Wood, Barrow, Tools, &c., &c.; also TWO DOGS, one a Scotch Terrier, the other Isle of Skye.—On view, Tuesday and morning of sale; and Catalogues had on the premises, and of the Auctioneer, 6, Lisson Grove, London.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

T. F. WINSTANLEY, NURSERYMAN, SEEDSMAN, and FLORIST, begs respectfully to inform his patrons, the nobility, and public, that he has added to the above business that of AUCTIONEER and VALUER to noblemen, gentlemen, and nurserymen about relinquishing their establishments, or otherwise desirous of disposing of their stock of Conservatory, Greenhouse, and Stove Plants.

T. F. W. having been for some years in a Nursery previous to his coming to Manchester, trusts that his knowledge of Plants and their value will enable him the better to dispose of them than any ordinary Auctioneer.—28, Market Place, Manchester.

AGRICULTURAL SEEDS, MEADOW & PASTURE GRASSES, &c.

PETER LAWSON AND SON, of Edinburgh and London, the QUEEN'S SEEDSMEN, NURSERYMEN, and WOOD FORESTERS; and to the HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

GRASS SEEDS, SEPARATE OR MIXED.—*Gentlemen intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.* Price 24s. to 30s. per acre for Permanent Pasture.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SUTTON'S IMPROVED ITALIAN RYE-GRASS, AND DICKENSON'S ITALIAN RYE-GRASS, are both very superior to the Italian Rye-grass commonly cultivated.

At present Messrs. SUTTON *have a supply of true Seed of each sort, price 7s. 6d. per bushel.*

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

TO THE TRADE.—*The Subscribers can supply the following* AGRICULTURAL SEEDS *to the Trade. Prices on application.*

White Belgian Carrot.
Yellow Globe Mangold Wurzel.
Long Red " "
Skirving's Swede Turnip.
Rendle's " "
True Devon Evergreen Grass.

Apply to WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

RENDLE'S IMPROVED SWEDE TURNIP.—*This is the most hardy variety in cultivation, and has stood the late severe winter, in the most exposed situations, without the least injury. The Subscribers have received scores of letters during the past month to confirm this statement.*

It is handsome in form. Small tap roots will keep longer than any other sort, and is altogether a most valuable variety.

It has been selected with much care for the last seven years, and the present stock has been grown by growers of the first respectability. Price 2s. per lb., or 1s. 9d. per lb. if taken by the cwt. Wholesale Dealers can be supplied with a few bushels.

For Description, Testimonials, and Engraving, see RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY."—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—

NEW PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer to Amateurs and to the trade his following new plants:—

ACHIMENES (TREVIRANIA), AMBROISE VERSCHAFFELT. This is the finest Achimenes of all; a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 1, 1855. Nice plants will be sent out next May, each 8s.—N.B. One over if three plants are taken.

TYDEA WARSCEWICZI; magnificent plant for foliage, and particularly for the flowers. It is the finest gesneriaceous plant of all; a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 1, 1855. Strong plants are now ready for sale, each 15s.—N.B. One over if two plants are taken.

RHODODENDRON (HARDY) PRINCE CAMILLE DE ROHAN. This is the finest hardy variety raised; a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 2, 1855. This variety is warranted to be quite hardy, and very free bloomer. Nice plants will be sent out next May, each 15s. N.B. One over if three plants are taken.

Agent in London: Mr. R. SILBERRAD, 5, Harp Lane, Great Tower Street.

ROSES IN POTS, FOR FORCING.

JOHN AND CHARLES LEE [illegible] to offer SEVERAL [illegible] strong dwarf [illegible] YBRID PERPETUAL ROSES, of the best kinds, well established in pots, and fit for immediate forcing. The wood being well ripened, they cannot fail to produce an abundance of bloom, and they will be found invaluable for filling up beds that have suffered from the late severe frost.

Nursery, Hammersmith, near London.

STRAWBERRY PLANTS.

WILLIAM NICHOLSON is now sending out fine strong plants of his four New and excellent varieties, viz., AJAX, the finest dessert fruit; RUBY, do.; CAPTAIN COOK, dessert and market; FILLBASKET, do., tremendous bearers, at 6s. per 100. The plants have been kept in frames under glass, and are in good condition for planting. Post-office orders payable at Yarm, Yorkshire, are in all cases required with the order.—Egglescliffe near Yarm, Yorkshire.

THOMAS BEACH, the well-known Strawberry Grower, begs to say that he has now ready a large stock of fine strong Plants of his TRUE BRITISH QUEEN, the same he beat the whole world with at the Crystal Palace, many weighing from 2 to 3 oz. each, likewise the same he gained the Knightian Medals with at Chiswick, and other places. He has gained the head prize, and surprised the world, both in flavour and weight. Strong Plants sent to any part of the world, at 5s. per 100, box included.

Post-office Orders on Hounslow, to Mr. THOMAS BEACH, Strawberry Grounds, Worton, Isleworth, Middlesex.—March 24.

SWEDISH TURNIP SEED.

STUART AND MEIN have for sale a considerable quantity of PURPLE-TOPPED SWEDISH TURNIP SEED of last season's produce, which they can recommend as true to kind, and of first-rate quality.

Also PERENNIAL RYE-GRASS, 15 lbs. per bushel, warranted from a prime Ayrshire stock. Prices on application, with a reference from unknown correspondents.

Kelso, Roxburghshire, March 24.

TO THE SEED TRADE.—TURNIP SEEDS, &c.

Skirving's or Liverpool Swede	Orange Globe Wurzel
Laing's	Broccoli, of sorts
White Globe Turnip	Fairbeard's Nonpareil Peas
Green	Cole's Crystal White Celery.
Red Tankard	

W. J. EPPS can with confidence offer the above (not large quantities), having been grown from the best selected stocks possible.—Prices sent on application.

Seed Establishment, High Street, Maidstone, March 24.

HORTICULTURAL SOCIETY OF LONDON.—The SECOND SPRING MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, April 3, from 12 to 5 P.M.

HORTICULTURAL SOCIETY OF LONDON.—GARDEN EXHIBITIONS.

Notice is hereby given that the FIRST EXHIBITION of the Season will take place, by permission of her Majesty's Commissioners for the Great Exhibition of 1851, in the GROUNDS of GORE HOUSE, on WEDNESDAY, May 16.

The Garden will be opened to the Public at TWO o'clock, under the following regulations:—All Fellows of the Society will be admitted without tickets, from half-past 12 till 6 o'clock, on signing their names in a book at the entrance. Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society.

All Fellows who shall apply, on or before Monday, the 30th of April, may obtain at the PRIVILEGED RATE of Three Shillings and Sixpence each, any number of tickets NOT EXCEEDING THIRTY SIX; but no application for such tickets will be received after that day. *Fellows of the Society subscribing for tickets at this price will be allowed a clear week from the 30th of April during which they may claim them.* AFTER THAT PERIOD ALL THE 3*s*. 6*d*. TICKETS SUBSCRIBED FOR, BUT NOT ISSUED, MAY BE CANCELLED. After the 30th of April, any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket.

All applications for tickets must be made at the Society's office, 21, Regent Street.

NO TICKETS WILL BE ISSUED IN REGENT STREET ON THE DAYS OF EXHIBITION. On those days Offices, near the Garden Entrance, will be opened at half-past 12 o'clock for the issue of tickets at 7*s*. 6*d*. each; but still under the regulations above stated.

SPECIAL PRIVILEGE OF FELLOWS.—Fellows of the Society not only enter free at half-past 12, but can also introduce two friends, WITH TICKETS, at Gore House, Kensington Gore, May 16; at Chiswick, June 20, and July 11. Or the Fellow's power may be transferred to a brother, sister, son, daughter, father, mother, or wife, residing in the Fellow's house, provided the person to whom the transfer is made be furnished with a ticket signed by that Fellow. That is to say, the power of entering early may be transferred, but not the right to FREE admission.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season will take place on WEDNESDAYS, May 9, June 13, and July 4; and of AMERICAN PLANTS, MONDAY, June 18.

Tickets of Admission are now being issued, and may be obtained at the Gardens only, by orders from Fellows or Members of the Society—price on or before May 5, 4*s*.; after that day, 5*s*. each.

CRYSTAL PALACE.—HORTICULTURAL FETE.—It is intended to hold a grand Horticultural Exhibition at the Palace on SATURDAY, the 2d of June next. The Rules and Schedules of Prizes are now ready, and can be obtained on application to the Secretary.

March 23. (By Order.) G. GROVE, Secretary.

NORTH WILTS HORTICULTURAL AND FLORICULTURAL SOCIETY.—The Exhibitions for this year will be held in the Castle Grounds, Devizes, on THURSDAY, the 5th of July, and on THURSDAY, the 6th of September.

Devizes, March 31. J. J. FOX, Hon. Secretary.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, Exotic Nursery, Canterbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

Catalogues with full descriptions on application, Woodlands Nursery, Isleworth.

MESSRS. E. G. HENDERSON AND SON having purchased of the late W. Story, Esq. of Newton, in the county of Devon, for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, a new feature in this tribe introduced by him, and in consequence of an advertisement appearing in the *Gardeners' Chronicle* from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, it was thought necessary, after a written communication with that gentleman, for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received in the month of November last Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of numbers of their customers having ordered plants at higher prices than are now quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to those purchased of Mr. Story.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

	Per packet—s.	d.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Holloway.

GREAT NOVELTIES FOR THE ENSUING SEASON,

FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE, AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

CALANTHIFLORA-PLENA

(The DOUBLE Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double Snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10s. 6d. each.

Together with a very beautiful new double Purple variety,

VIOLÆFLORA-PLENA,

Rich double blue corolla, resembling a fine double violet, 7s. 6d. each.

L., P., & Co. have also fine plants of the following choice kinds of Fuchsias at 18s. to 42s. per dozen.:—

Aspasia	Glory	Purple Perfection
Apollo	Lucretia	Sir Harry Smith
Brilliant	Orion	Sidonia
Duchess of Lancaster	Prime Minister	Sir Jno. Falstaff
Duke of Wellington	Princess	Telegraph
Dominiana	Kossuth	Resplendent.

They are also now prepared to send out their beautiful new

VERONICA KERMESINA,

Raised by that eminent horticulturist J. Luscombe, Esq., of Coombe Royal, who sent specimens to Dr. Lindley, at the time of its first flowering, who thus pronounces his first opinion of it:—"The variety sent with this was charming, a decided rose colour having mingled with the violet." See also notice of Dr. Lindley in the *Chronicle* for Dec. 2, 1854, as follows:—"L., P., & Co. Your V. Kermesina is a handsome dark variety of V. speciosa; its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite." Price 7s. 6d. each. A few extra-sized specimens may be had.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—ESTABLISHED IN 1720.

Seed and Horticultural Establishment, Sudbury, Suffolk.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato; and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KEENAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

SELECT CARNATIONS, PICOTEES, ETC.

CHARLES SCHOFIELD (late JOHN SCHOFIELD & Son) respectfully begs to offer for sale the following in strong healthy plants, viz.—12 pairs of Carnations for 8*s*., 10*s*., or 20*s*.; 12 ditto Picotees, for 6*s*., 10*s*., or 20*s*; 12 ditto of Pinks, for 4*s*., 6*s*., or 12*s*.; 12 Plants of Pansies, for 4*s*., 10*s*., or 15*s*.; 12 ditto of Dahlias (in May), for 3*s*., 10*s*., or 20*s*.; 12 ditto of Scarlet Geraniums, for 6*s*. or 12*s*.; 12 ditto of Verbenas, for 4*s*. or 12*s*.

Also the following Seeds, selected from the choicest show flowers, Pansies, Calceolarias, and Hollyhocks, each per packet, 2*s*. 6*d*. or 1*s*. 6*d*. A Descriptive Catalogue of the above plants sent free on application inclosing one postage stamp.

Knowsthorpe, near Leeds, Yorkshire.

NEW SCARLET VERBENA—MRS. WOODROFFE.

ARTHUR HENDERSON AND CO. will send out, the first week in April, a NEW SCARLET VERBENA, a very decided improvement upon the great favourite Scarlet Defiance; being similar in habit, but the trusses of flowers and also the single flowers are nearly double the size, and with equal—if not more—brilliancy of colour.

A. H. & Co. having a large stock to cull from, and being desirous that their patrons shall at once enjoy the pleasure of seeing a good mass of this valuable bedding plant in their own flower gardens, have determined on sending out fine strong plants at 18*s*. per dozen, or 5*l*. per hundred.

Testimonials of the highest order could be given in favour of this Verbena for its size and colour, but the recommendation of ARTHUR HENDERSON & Co. is no doubt quite sufficient, without troubling their friends with any further remarks.

Pine-Apple Place, Edgware Road.—March 31.

NEW AND DISTINCT PELARGONIUM.

V. GAINES begs to submit to the Nobility, Gentry, and Trade, the following description of his very beautiful first class Pelargonium.

TETE NOIR.—Flower large size, upper petals rich velvety black, of good substance and smooth on the edges, inclined a trifle to reflex, which in this variety rather adds to its beauty than otherwise, showing to advantage its richness of colour; lower petals beautifully shaded, orange salmon with velvety black spot in each. The orange colour combined with the darker shade of this truly beautiful flower gives it a most gorgeous appearance: it is, without exception, the greatest novelty of its class, and will form a conspicuous object in the choicest collection. Price per plant, 31*s*.

N. G. also has a large collection of Geraniums, comprising all the newest varieties; also Dahlias, Fuchsias, Stove and Greenhouse Plants, Ericas, Epacris, Correas, Ferns, Azaleas, Rhododendrons, &c., &c., Catalogues of which may be had post free on application.—The Nursery, Surrey Lane, Battersea.

REDUCED PRICE.

WARD'S OMER PACHA STRAWBERRY.

WILLIAM JAMES WARD respectfully informs his friends and the public that he has still a few well-rooted plants to offer of the above excellent Strawberry, which obtained the Bronze Medal at the Royal Botanic Garden Exhibition, July 5, 1854.

It was submitted for opinion to Mr. Thompson, Horticultural Society, Chiswick; Mr. Marnock, Royal Botanic Gardens, Regent's Park; Mr. Powell, Royal Gardens, Frogmore; Mr. Spencer, Bowood Gardens; and several others: all of whom speak highly favourably of it.

The following extract, accompanied with a woodcut, appeared in the "Florist and Fruitist," September, 1854, in the descriptive list of new Strawberries:—

"OMER PACHA.—This variety is a seedling raised by Mr. Ward from British Queen, fertilised by the old Caroline Pine, two good kinds, of which the present variety seems to be a combination. The samples I received were fine looking fruit, and of good quality."

W. J. W. warrants it of very superior flavour, and well adapted for long carriage.

100 Plants	£2 0 0	25 Plants	£0 15 0
50 „	1 5 0	12 „	0 8 0

Terms, cash.—Prospect Hill, Reading, March 31.

CHARLES TURNER begs to recommend the following Seeds:—

SARBATIA STELLARIS.—This beautiful Greenhouse Annual was raised at the Royal Gardens, Frogmore, from seed received from Texas, and was exhibited at the Horticultural Society's July Show, at Chiswick, and was awarded a First Class Certificate. It is of a deep rose colour, with a yellowish-green eye and sweet-scented. It should be grown in a mixture of half leaf-mould, with the other half comprised of light peat, loam, and silver sand, and sown in a little heat. 2*s*. 6*d*. per packet.

NEW CUCUMBER, "WARD'S IMPROVED SION HOUSE," superior either to the "Improved Sion House" or "Lord Kenyon's Favourite," for winter use. Mr. Ward, of Prospect Hill, Reading, who raised it, writes—"I can strongly recommend it as the best winter sort I ever met with: and it always swells out, not plumber's iron fashion, as is the case with many others, and equal in bearing to Lord Kenyon's Favourite, generally throwing three or four fruit together." Price 1*s*. 6*d*. per packet.

	s. d.
HOLLYHOCK SEED, saved from the newest and finest sorts in cultivation, per packet	2 6
„ „ smaller packets, each ..	1 6
DAHLIA SEED, saved from the very best exhibition flowers, per packet	2 6
„ „ smaller packets, each	1 6
CALCEOLARIA, extra quality, per packet	2 6
CINERARIA, extra quality, do.	2 6
BALSAM, from best show flowers, do.	2 6
„ „ „ smaller packets, each	1 6

The new white bedding Calceolaria "Purity," the entire stock of which is in CHARLES TURNER's hands, also his new Dahlias, new Verbenas, &c., will shortly be advertised.

Royal Nursery, Slough.

NEW ROSES.

A. PAUL AND SON have to offer the following New ROSES, good healthy plants, for which early orders are solicited. The kinds marked thus (*) can be highly recommended from their own knowledge. Most of the others *not having yet bloomed in England* are offered on the faith of their respective raisers. The kinds marked thus (†) can be supplied either as Standards or Dwarfs, at the prices here attached:—

HYBRID PERPETUALS.	s. d.

N.B. The new Hybrid Perpetual Rose Emperor Napoleon will not be sent out before June; by that time I shall have proved it. If not more than semi-double, I much question if it is worth 7*s*. 6*d*. I, however, received a very high character of it, which induces me to offer it to the public, *but not to let it out before proving its worth.*

Carriage paid to any Station on the Eastern Counties Railway.

St. John's Street Nursery, Colchester.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out the following New Plants on the 30th April next:—

HYDRANGEA HORTENSIS, flore pleno, 10*s*. 6*d*.
PHLOX QUEEN VICTORIA, 5*s*.
DAHLIA EMPEROR FRANCIS JOSEPH (variegated foliage), 10*s*. 6*d*.

SHRUBBY BEDDING CALCEOLARIAS.

Brunette	7*s*. 6*d*.	Norma	7*s*. 6*d*.
Coreggio	7 6	Red Rover	7 6
Maggiore	7 6	Vezzosa	7 6
Minnie...	7 6	Wildfire	7 6

Or the set of eight varieties, 2*l*. 2*s*.

With the permission of Mr. C. Turner they will offer his new CALCEOLARIA PURITY (the best white bedding variety) at 7*s*. 6*d*. each, or with the above set 2*l*. 7*s*.

FUCHSIAS.

Queen Victoria (Story)	10*s*. 6*d*.	Lady of the Lake (Story)	10*s*. 6*d*
Prince Albert (Banks) ...	10 6	Water Nymph (Story) ...	10 6
Perrugino (Story)	10 6	Raffaelle (Story)	10 6
Empress Eugenie (Story)	10 6	Mrs. Story (Story)	10 6
Ranunculaeflora (Story)...	21 0	Snowdrop (Story)	10 6

Or the set of ten varieties, 4*l*. 4*s*.

FUCHSIA BANKS' FAVOURITE (Banks), 10*s*. 6*d*.

For full particulars of the above see back numbers of this Paper.—March 31.

THE ANNUAL SPRING EXHIBITION OF PLANTS IN THE EXETER NURSERY.

LUCOMBE, PINCE, AND CO. very respectfully beg leave to announce that their superb specimens of CAMELLIAS are now in flower; they are particularly fine this season, and great additions have been made to their collection. Their New Show House is also filled with an extensive assortment of various Fine Plants, which cannot fail to gratify those who pay their Nursery a visit, as it is now and will continue for a long time to be exceedingly brilliant and attractive with all the gayest Spring and other Choice Flowers.

L., P., & Co. have now several experienced Gardeners whom they can strongly recommend.—Exeter Nursery, Exeter, Mar. 31

NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that his beautiful new Seedling Shrubby CALCEOLARIAS are now read to send out, price 3*l*. the set of fifteen. The usual allowance to the trade for cash only. The following is Mr. Glenny's opinion upon them:—"Shrubby Calceolarias—Without exception the best batch of seedling Calceolarias we ever saw; we could pick out several that are far better than nine out of ten of the varieties now esteemed good."

H. M. offers a second set of twelve, to include all his best sorts sent out last year, price 25*s*.

Choice Calceolaria and Pansy Seed, 2*s*. 6*d*. per packet; also a few packets of very select Alpine Auricula Seed, 2*s*. 6*d*. per packet.

It is respectfully requested that orders from unknown correspondents be accompanied by a Post-office order.

Postage stamps are requested in payment of the seeds.

A descriptive Catalogue of the new Calceolarias may be had on application.

OSAGE ORANGE (MACLURA AURANTIACA).

CHARLWOOD AND CUMMINS beg to announce that they have received from America Seeds of the above-named valuable Hedge Plant, which they are ready to send out at 4*s*. per lb., accompanied with directions for sowing and treatment, as described in the *Gardeners' Chronicle*, May 13th, 1854.

They have also received their annual importation of American Trees and Shrubs; Seeds, consisting of Azaleas, Rhododendrons, Quercus, Red Cedar, &c., of which a Priced List will be sent on application.

One-year Seedlings of the following varieties of American Oaks, at 4*s*. per 100: Quercus nigra, Banisteri, alba, and obtusiloba. Fine Plants of Aquilegia glandulosa, 20*s*. per dozen. Lilium giganteum, per 100 seeds, 20*s*.

SEED POTATOES.

	s. d.		s. d.
Lapstone Kidney, per bush.	7 0	Early Defiance, per bush.	7 0
Ash-leaved do. „	8 0	Forty-fold ... „	6 0
Soden's Oxford ... „	7 0	Early Manley ... „	7 0

C. & C. will be glad to receive offers of 1, 2, and 3-years old Quick.—14, Tavistock Row, Covent Garden, London.

PLANT YOUR POTATOES WITH JACKSON'S PATENT PREPARATION.

BASS AND BROWN having been appointed Agents for the above, will be happy to furnish it to their customers who may be forwarding their orders for Potatoes or other goods. Also Agents for PAGE'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT.—Sudbury, Suffolk.

PAGE AND CO.'S BLIGHT COMPOSITION.

Extra Strong, 4*s*. per gallon, sufficient to make four (Jars and Barrels extra); in Bottles, 1*s*. 3*d*. and 2*s*. 6*d*. each. Directions for application forwarded. 10 Gallons and upwards Carriage Free to London. Should be in the hands of all Plant and Fruit Growers. See *Gardeners' Chronicle*, March 3, 1855. It can now be obtained of

Messrs. F. & A. Dickson & Sons, 106, Eastgate Street, Chester, and 14, Corporation Street, Manchester
Bass & Brown, Sudbury
Sutton & Sons, Reading
W. & G. Davison, St. Peter's Street, Hereford

Mr. W. F. Smith, Rivershead Nursery, Sevenoaks
Messrs. Fisher, Holmes, & Co., Handsworth Nursery, Sheffield
Mr. Thos. Cridland, Willeton, near Taunton
Mr. E. Taylor, Malton, Yorkshi.
Mr. S. Smee, Halstead, Essex
Mr. Henry Horne, Henley-on-Thames
Mr. Thomas Pierpoint, Warrington, Lancashire

and of the Inventors and Manufacturers—

B. PAGE & Co., SEED MERCHANTS, Oxford Street, and Above Bar, Southampton.

N.B.—Other names will shortly appear, as the agents are appointed.

The Gardeners' Chronicle.

SATURDAY, MARCH 31, 1855.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, April 3 { Horticultural ..... 3 P.M.
Linnean ..... 8 P.M.

IN the year 1852 the following statement appeared in the "Botanical Magazine:"—

"During the early part of the present year seeds of an Australian Nymphæaceous plant were in the hands of several cultivators in this country as a new Victoria, *Victoria Fitzroyana*, with flowers of a 'purplish blue:' from what source obtained I have not been able to ascertain. Those which were obligingly presented to us by Mr. CARTER and Mr. STOKES under that name were, we think, not the seeds of a Victoria, but of a Nymphæa; and were so crushed in a letter, and sent dry, that we have no hope of their germinating. Now, it does happen that we received during the past year specimens of a magnificent new Nymphæa from our friend Mr. BIDWILL, gathered in the Wide-Bay district, North-eastern Australia, some of whose flowers certainly vie with the ordinary ones of *Victoria regia*, being a foot in diameter, and if not of a purplish blue colour, yet blue—the blue, as it would appear, of the well-known *Nymphæa cærulea*. We are much disposed to think that this is the plant producing the seeds in question, and that the plant having been known

to other colonists in Australia, the seeds have been by them sent to their friends in this country, under the name of *Victoria Fitzroyana*. Mr. Bidwill is too good a botanist to have done so. Be that as it may, we deem it a matter of duty now to lay a figure and description of our magnificent plant before the public, and even a *coloured* figure; for so beautiful are the specimens dried by our valued friend and correspondent, that we think we cannot err much on that point. And sure we are that, even should all the seeds above alluded to fail to germinate, or prove to be those of another plant, our Nymphæa gigantea will, ere long, find its way into our tropical tanks, and adorn them with a Water Lily little inferior to the Royal Victoria in the size or beauty of its flowers, and with leaves equally remarkable in size, for a true Nymphæa, being 18 inches to 2 feet across. A tuber which we have lately received from Mr. Bidwill for cultivation, but unfortunately dry and dead, is about the size of an ordinary Apricot, and nearly as globose, having numerous depressions or eyes, like the 'eyes' of the Potato, with a scale at each depression."

As Sir William Hooker foresaw, this Australian Nymph has found her way to Europe, and now exists in a living state in several continental collections. It has even flowered and seeded with Mr. Van Houtte, of Ghent, with whom it produced delicate blue blossoms nearly 8 inches across. It appears, however, that there is some difficulty in managing the plant, for tubers sent to Mr. Edward Otto, of Hamburgh, and others, obstinately refused to move, or only produced a few scale-like leaves which soon died off again, and would not root at all. Upon this subject Mr. Ortgies, the skilful plant manager in Mr. Van Houtte's nursery, has remarked to the following effect (*Rev. Hort.*, 1855, p. 92):—"I have had similar complaints before, and I have myself met with the same difficulty; and although the intractable lady is now in full flower and has continually five or six flowers open at a time, I am far from being satisfied with the result; the plant is in fact a puzzle. However, don't fancy your tubers lost; I have had them for 12 months with little undeveloped leaves, and nevertheless they have ultimately started. Once set a-growing they push with surprising rapidity. I am of opinion that the plant requires to be very deep in the water, and that we have been all wrong in putting the tubers near the surface; and for the following reason. Last spring all the tubers, after having been kept dry during winter, were replanted and placed in shallow water. A few days after they began to move; but the young leaves made no progress, and never reached the surface. It was, therefore, obvious that no roots could be formed; for in this, as in Nymphæas, the roots appear *after* not *before* the leaves. One day I found that some little leaves had reached the surface of the water, and upon inquiring into the cause, I found that a pot had been upset and had tumbled to the bottom of the tank, which was 2 feet deep. As soon as the tuber was thus carried beyond the action of light, its leaves began to lengthen and spread over the water; larger leaves soon succeeded, and in a short time the plant was in full growth. Acting upon this hint, I placed the tubers 2 feet deep in water, and now they grow vigorously."

M. Ortgies deserves honourable mention for this very useful discovery; of which growers will know how to profit in other cases besides that of the Great Blue Australian Water Nymph.

The scarcity of textile materials, that is to say, of vegetable fibres capable of being manufactured into linen, cordage, or paper, still continues, and appears likely to increase. Whatever importance the subject possessed when we last drew the attention of growers to it (see *Gardeners' Chronicle*, 1854, pp. 300 and 340) is now considerably augmented. We are, therefore, sure that the public will receive with much satisfaction Dr. Royle's new work on the "Fibrous Plants of India,* in which the learned author gives a full and particular account of all the known textile species found in our Asiatic possessions.

As we have formerly observed, all countries that can support a vigorous vegetation abound in vegetable fibres of greater or less value; the tropics are most especially rich in such substances, partly owing to the exuberant growth of plants under the combined influence of a moist atmosphere and high temperature, and partly because of the great variety of species which such climates bring forth. It is therefore impossible to move in any good climate without encountering the materials in question at every step. Nevertheless, notwithstanding their importance, our much boasted commercial enterprise has found in Great Britain nothing for general employment except Flax and Hemp (straw is hardly worth notice), and in all the world only Flax, Hemp, Cotton, Jute, and New Zealand Flax and Bowstring Hemp—just half a dozen out of the thousands of articles which the vegetable kingdom is ready to yield up. To these may indeed be added Coir for mats and cables and the coarsest uses.

In the review of what India is known to offer we find mention made of various Grasses, Sedges, Screw Pines, Palms, Liliaceous plants, Plantains, Malvaceous plants, Leguminous plants, Dogbanes, Daphnes, Nettles and their allies, with a host of other products, cheap and abundant, which India is able to supply if our manufacturers will take them. And that which is thus bounteously furnished in the East is as lavishly offered by the West. Nevertheless, Flax, Hemp, and Cotton remain the manufacturers' great reliance, just as they were in the days of Sennacherib. Why is this? Is it because of the wonderful excellence of these fibres, and of the inferiority of all similar products? Let us hear what Dr. Royle has to say upon that point:—

"It is now well known that India possesses, and indeed exports, various fibres which are produced by several fast-growing plants. Of these fibres, some, though long and fine in texture, are deficient in strength; others appear coarse in texture, or are harsh in feel, and yet not remarkable for tenacity. It has therefore been inferred by some very intelligent men, that the heat and moisture of the climates where these grow are favourable to rapid growth, which of itself is sufficient to account for the want of strength; and that therefore we cannot expect to find them suited to the production of good fibres. But here the conclusion come to is equally hasty, for no distinction is made between what is due to the nature of the plant itself, and what to its mode of cultivation, or to the preparation of its fibre, and what to the effects of soil and of climate. We do not in this country expect the Willow to have the strength of the Oak, nor that a rope of Rushes will have the tenacity of even a cord of Hemp. Yet all may be seen growing in the vicinity of each other. There is as little reason for expecting that the soft and silky Jute of India is to have the strength of either Flax or of Hemp; and because it does not have it, for inferring that there cannot be produced in its vicinity other fibres possessed of greater strength. But, if we were to judge from the density and strength of some of the woods produced in the hottest and moistest, as well as in some of the driest climates, we might expect to find plants in the same localities which are equally conspicuous for tenacity of fibre. Instead, however, of inference, I hope to be able to prove, to the satisfaction of even the most sceptical, that India grows plants in some of its dry and barren plains, yielding fibres which are as strong and tough as any produced in other parts of the world; but which are equalled in such qualities by others growing in some of its moistest and hottest valleys. Some of these, while possessed of the greatest strength, are also divisible to any extent of fineness. Most of them exist in sufficient quantities, or are so easily cultivated, as to be of great commercial and manufacturing value; because it has been ascertained that they can be brought to the markets of Europe even from these distant fields, so as to contend in price, even in ordinary times, with the favoured products of the nearest countries."

It is, therefore, clear that colonial fibres are not neglected because of their quality, especially when the more usual materials are dear, but for some other reason. That reason is commercial indifference, as Dr. Royle well explains:—

"If we inquire into the history of many of the most important articles of commerce, we shall find that they were at first either neglected or abused. Large sums were expended, and much money was lost, before they came to be established as regular articles of commerce. The difficulty in making new things known and appreciated as articles of commerce, arises chiefly from the habitual neglect of such things when sent for inquiry from abroad, in order to have their value ascertained at home."

"Indeed, I am informed, that the novelty of the appearance, or the strangeness of the name, is more often the subject of jest, than the article is one of serious inquiry. At all events, the result usually is, that the article is sold at a price which does not pay its expenses, and the planter is deterred from sending any fresh quantities. Further progress is, in that quarter at least, thus stopped, even at its commencement."

Evidence like this shows that our much vaunted commercial enterprise moves in a much narrower track than is supposed; and that while gentlemen at Manchester are clamorous, with very good reason, about inexorable official routine, they quite forget that their own routine is as inexorable in another way. It is for this reason that Dr. Royle is obliged to declare that great as the value of Indian Fibres undoubtedly is, they will not find their way into the home markets without some little encouragement. The encouragement deemed necessary is not, however, Government or other assistance which shall place the raw produce in an unnaturally advantageous position in the market; it is not to be given in the shape of bounties or protective duties, or in any other of those ways which are opposed to the principles of political economy. The only encouragement advocated by the author consists in a little patience on the part of the home merchant, and a little trouble on the part of the producer and broker. As it is, the merchant is ignorant of the existence of the raw material, of its excellence for the purposes of manufacture, of the facility and cheapness with which it can be brought into the market. On the other hand, the producer knows not that his fibre is suited to supply the demand for more cordage, more clothing, more paper, and if he sends some of his material to this country, in the hope that somebody may find a use for it, he is told by the broker that the commodity is unknown in the market, and no one will buy an untried article; the broker himself knowing nothing of what is consigned to him, except that he has never seen it before. The removal of these sources of discouragement is the encouragement declared necessary by the author. Let the merchant take the trouble to inquire into the means of production and the nature of the material—let the broker acquire such knowledge as will enable him to make those between whom he stands better acquainted with each others wants—let the producer see that if he will furnish a steady supply, that supply will be taken off his hands, and there seems no reason to doubt that Indian Fibres will, from their abundance and cheapness, hold their own against all competition. No other encouragement, at all events, is sought for them. We should not have dwelt upon this point had not a writer in the *Economist* made some remarks upon the same subject, which would lead the reader to infer that Dr. Royle advocated encouragement in some other mode. The writer in question appears to us wholly to have mistaken the sense in which the author has used the word encouragement, and such is the deserved repute of the opinions of the *Economist* on all matters relating to political economy, that it becomes no less just to the author than important to the mercantile community, to show that no protection, no bounties, no favouritism of any kind is sought for the producers of the materials in question. A fair trial is all that is recommended; once made, the rest will take care of itself.

No doubt one reason why manufacturers are apt to throw cold water upon new raw products is that their machinery must be altered to work them up. That is inconvenient and to be avoided. Just as in a public office the officers cling to old routine, although it can be made clear that it is detrimental to the public service, because it is troublesome to change official habits. The machinery of a government department is its clerks and books and checks and foolscap paper. The machinery of a manufacturer is his steam-engines, looms, printing blocks, spinning-jennies, and carding machines. What is the difference except that one is fed with beef and bread, the other with coals and oil?

We once asked a manufacturer celebrated for good taste why he continued to issue the frightful patterns then in vogue. "Why," he replied, "should I alter my patterns, ugly as they are, so long as I can sell them as fast and as profitably as better things? In like manner if another is asked why he continues to use an expensive instead of a cheap description of raw material of equal or greater excellence, he would probably say, "Why should I alter my machinery for this novelty, when the old article notwithstanding its dearness to the consumer is just as profitable to me?"

We are persuaded that this is the true history of the indifference with which new kinds of raw materials are received in the produce market. The only cure for it is competition; and that it is to be hoped that we shall speedily witness. Nothing indeed but the state of the law has prevented its being already established; for it appears from proceedings in the House of Lords that Mr. Shaw, who has most honourably distinguished himself in his attempts to introduce a cheaper and better class of textile materials, when he applied to the Privy Council for a charter of incorporation, which would limit the liability of those ready to find him capital, was met by the objection that a charter might not be wanted, because the whole question of limited liability was under the consideration of Government; and then when months afterwards inquiry is made into the intentions of Government with

* The Fibrous Plants of India, fitted for Cordage, Clothing, and Paper; with an account of the preparation of Flax, Hemp, and their substitutes. By J. Forbes Royle, M.D. 8vo. Pp. 403. Smith and Elder. 12s.

respect to introducing a bill for legalising partnerships with limited liability, the same stereotyped reply that the subject was still under consideration was all that could be elicited.

But it is not alone because of Indian fibres, whether from the East or West, that this question becomes of importance, nor even because it promises to secure a reduction in the price of such necessaries as cordage, linen and paper, but because there is every reason to suppose, as we have always contended, that with suitable machinery and sufficient competition there are waste or worthless products at home which may be brought most profitably into consumption.

It is not improbable that Hemp and Flax refuse might become valuable as ingredients in paper making; so may dried Potato haulm, Jerusalem Artichoke stalks, and other substances. Indeed we have now before us cleaned fibre, extracted from Mangel Wurzel after crushing and preparing it for the sugar maker or distiller, which an eminent paper maker valued at the minimum price of 10*l.* per ton. It was prepared on the estate of the Rt. Hon. Thos. Francis Kennedy, in Scotland, and could be had in enormous quantities if distillation from Beet should become a branch of British industry. It is also probable that the Holcus saccharatus may, as Mr. John Henderson thinks he has ascertained, be worth growing for the same purpose, the crushed straw, after yielding up its sugar, consisting chiefly of vegetable fibre of excellent quality.

But, as Dr. Royle observes, these efforts at introducing cheaper materials than we now have require encouragement; such for instance as the introduction of a law which will enable speculations to be carried on without exposing their promoters to the danger of unknown, unforeseen, and unlimited liability. Scientific knowledge has pointed out the source of boundless supplies of cheap manufacturing materials; and it only remains for an enlightened legislature and commercial skill to render them generally available. For ourselves we entertain no doubt that to work out the textile problem to its final solution would be to cheapen our clothes, our books, and our navy, and would be of far more social importance than the repeal of every one of the so-called taxes on knowledge.

New Plants.

121. Rhododendron citrinum. *Hasskarl Cat. Hort. Bogor.* 1844, *p.* 161. *B. M., t.* 4797.

A Javanese species, with yellow campanulate flowers as large as a sparrow's egg. It inhabits the mountains of Java, at the height of 5000 ft. in swampy places. Messrs. Rollissons' collector, Henshall, found it in similar places, but 4700 feet higher, and it is to that eminent firm that its introduction was owing. It is said to grow on the branches of trees in its native country; but it is not the less able to thrive in earth on that account. According to Mr. Van Houtte, it likes in winter a low damp stove, at 39° to 50°, and close to the light. About the first of April he puts it on an exhausted hot-bed, covered with glazed sashes (a cool Cucumber bed), taken off at night in cloudy or misty weather. Shaded from sun in the daytime, except in the early morning; completely shut up in windy weather or when it is bright and clear, turned out in a low damp place in an east aspect, from the 15th May to 15th September, it thrives perfectly well. After the last date it is restored to a cold pit, and put back into the stove when frost returns.

VEGETABLE PATHOLOGY.—No. LXV.

271.* Apostaxis. *Constitutional and Organic.* Gummine. There are so many curious points connected with the discharge of Tragacanth and Cherry gum, that a supplementary section is necessary for their illustration. It was long since conjectured by De Candolle that the swelling of Tragacanth in water must arise from the matter being inclosed in cells, and the analysis of Guibourt showed that it was very different in its physical condition, as well as in its chemical properties, from gum arabic, and that the insoluble part was, in point of fact, a mixture of starch and lignin. The complicated nature of the collections of bassorin in the roots of Orchids was pointed out many years ago in the Linnæan Transactions by Dr. Lindley. Since the article Gumming was printed, it became necessary for me to examine the structure of Tragacanth under the microscope, in illustration of a curious gelatinous body found on the Grass after the breaking up of the frost, in Sussex, which was sent to me by Mr. Borrer, and I then found that De Candolle's conjecture that the structure was cellular was really true, and on further consideration, it came into my recollection that there was something on the same subject in Kützing's* "Introduction to Botany," which on reference proved to be of some importance, and illustrated with excellent figures. Kützing, indeed, considers Tragacanth as a fungus; but I am not prepared to assent to such a view, for the structure is by no means that of any fungi, to which it could possibly be allied, and the case of Cherry gum, a substance so evidently of a similar nature, is almost conclusive against such a view. There are two sorts of Tragacanth, which are often mixed indiscriminately in commerce, of a different form and aspect, but whether they are the produce of the same plant or no, does not appear with certainty. The one, however, is known by the name of Flaky or Smyrna Tragacanth, and is supposed to be derived from Astragalus verus, the other Vermiform or Morea Tragacanth†, the produce as it is believed of Astragalus creticus. The first of these is white flabelliform or reniform, with a few concentric lines, and resembling very much in appearance some gelatinous fungus; the second forms long yellow tendrils, very much after the fashion of the cirrhiform threads of spores of Nemaspora. Both agree essentially in structure, but this is far more clear in the Flaky Tragacanth than in the other, and there is some difference in the component cells. When examined under the microscope they exhibit a mass of large rounded sacs, very loosely compacted, and capable of being partially separated from each other by slight pressure under a thin plate of microscopic glass. In the centre of each cell is an irregular cavity filled with starch granules, and the wall which incloses these is evidently formed of many concentric layers, calling to mind very forcibly the structure of the common many-coated hydatids. On the application of an aqueous solution of iodine, the starch granules at once declare their nature, and the addition of a little sulphuric acid turns the walls from white to a beautiful blue,‡ making a most pleasing object

under the microscope. The walls then consist of cellulose, but evidently in some different condition from that in which it occurs in ordinary cases, and perhaps including in their substance as in a sponge the bassorin, though there is no ambiguity of tint to indicate such a matter. This is, however, a chemical question. What we have to consider here is, inasmuch as the structure of the whole mass is cellular, can it be regarded really as an exusion, or is the matter formed by the increase of cells, by means of addition to the external surface as in fungi. The case is certainly one of considerable difficulty, but my belief is that in the first instance the gummy matter is collected between the bark and albumen; that it there becomes loosely organised after the fashion of lymph in animal structures; and finally that the accumulation is at length so large as to force its way through the bark and thus to make fungiform bodies. The cirrhiform condition is evidently squirted through the bark and not a mere external growth, and since this is organised in the same way as the Flaky Tragacanth, we cannot seek for a different origin of the latter. Now if a specimen of Cherry gum (using the term generically) be examined, the portion of it which is clearest and in a semi-liquid state will be found to contain portions of the woody tissue of the plant, showing clearly that in oozing out it has carried with it detached portions of the matrix, which have been broken off in the course of its exusion. Kützing has figured the growth of cells in this substance.§ I have not succeeded in ascertaining their presence in English gum; but in a specimen of South Carolina gum from Prunus serotinus, which I examined some years since, I remember being much surprised at the presence of cells, and supposed that they must be due to a little species of Sphinctrina which was parasitic upon them. Unfortunately I have no opportunity at present of re-examining the structure.‖ In either case the mycelium of different species of mould is very abundant. I have not examined a scrap of Tragacanth without finding quantities of mucedinous threads like those represented in the figure; and in gum from the Apricot the base absolutely consisted of a compact mass of mould threads glued together with gum, while in the less compact and more transparent portions abundant threads were swimming about, and every fragment of the protruded tissues of the matrix was swarming with parasites. It may be remarked in conclusion that Brewster ascertained that the varnish produced by such trees as Melanorrhea is organised when recent, and that the change of colour to red or black is induced by disorganisation. See Lindley, Veg. King., Ed. 2, p. 466. Our figure represents a portion of the cellular tissue of the Flaky Tragacanth interspersed with mycelium. The lower figure on the left is from the base of a piece of Apricot gum, showing the mucedinous threads of which it is compacted; while the upper figure represents a portion of the tissue of the matrix overrun with parasites. *M. J. B.*

* Kützing, Grundzüge der philosophischen Botanik, vol. i. 1851.

† Tournefort states (Voyage du Levant, vol. i. p. 21), that the vermiform Tragacanth which he gathered on Mount Ida is the product of a species of Limonium. He figures it as occupying at first cavities in the wood and bark.

‡ Kützing does not seem to have tested the cell walls with iodine and sulphuric acid, but only with these substances separately. He says therefore that Tragacanth consists of three substances:—1. Bassorin, which forms the outer thick wall, consisting of many layers; 2. A peculiar form of cellulose to which he gives the name of Gelin—this answers to what is commonly called the primordial membrane; 3. Starch granules. It is evident from the account given above that there is some error. The whole cell wall consists of what he calls Gelin.

§ Kützing states that little molecules arranged in moniliform threads are first formed at the base, that these gradually form large cells which in turn give birth to others, and that the gelinous substance (to use his own phraseology) is converted into bassorin as the cells become more and more superficial. The bassorin ultimately becomes more or less soluble, and the cellular structure is no longer capable of being recognised. Kützing, l. c., p. 204.

‖ Since the above was printed, I have examined a specimen of this gum, entirely free from any external parasitic growth. Part of the specimen was quite colourless and transparent, another was amber-coloured, and another brown; but I found no cellular structure whatever. The sporidia of an Hypoxylon, and the spores of a Pestaloazia were inclosed in the mass exactly as similar objects are in amber. It may be mentioned here, that on macerating a large piece of gum from a wild Cherry tree, with a view to obtain the cerasine free from any admixture, a brick-red substance was formed on the sides of the cup containing minute linear bodies, endowed with active motion. They did not revive on being moistened after they had become perfectly dry.

THE VINE DISEASE IN MADEIRA.

Funchal, Madeira, *March* 6, 1855.—Before leaving England in the last autumn, I told you that I would employ a part of my leisure here in making inquiries into some collateral points connected with the Vine mildew, which have not hitherto been much investigated. Through the kindness of Mr. Leacock and Señor Freitas Ferrar, old residents on the island, I have been fortunate in obtaining information which may be safely relied on; and in regard to the phenomena attending the fermentation, &c., of diseased Grapes, the testimony is that of a person whose occupation is distillation and its cognate processes.

1. As to the sorts of Grapes most liable to the attacks of the Oidium.—In Madeira the disease appears pretty indiscriminately to haunt all kinds; but its ravages are most rapid and disastrous in those which produce the best wines, as Malmsey, Muscatel, Sercial, Verdelho, Bual, Negra-mol, Negrinho, Bastardo, and Tinta. White Grapes have suffered more than black. Of the former, Malmsey and Verdelho most; of the latter, Tinta. In general, the Grapes richest in saccharine matter, and which therefore should yield most alcohol, were the greatest sufferers. The mildew attacks the Grape in every stage of its development, as well when it is in flower as when the berry begins to ripen. If while in flower (or before), the fruit does not set; if the berry be already set, it cracks on approaching maturity, and lays the seed more or less open, showing it to be partially separated from the pulp. Under such circumstances the pulp does not attain the semifluid state of maturity, but becomes in consistence like the pulp of an Apple, the bunch ceasing to grow, and speedily drying up. In some clusters a few of the berries will continue to grow, and even after cracking give some signs of ripening; but these contain very little juice, and that green and immature.

On arriving here in November, I was struck by the miserable appearance of the vineyards after the disease of the previous spring and summer. A few attenuated shoots struggling for life, on which appeared some black and shrivelled remains of bunches, with leaves hardly exceeding those of the Ivy in size. These were a strange contrast to some leaves of the Black Hamburgh, which I had gathered at home last summer on account of their unusual size, too large to be entirely concealed within the grasp of a quarto volume.

2. As to the phenomena attending the fermentation of diseased Grapes.—The fermentation in 1852, when the disease first appeared here, was short but violent. What wine was made tasted sweet, but with the fungose flavour of the disease. In 1853 and 1854, the few Grapes that were gathered at all, being taken earlier, were consequently less ripe. The fermentation in these was very slow and imperfect. The greater part became putrid without even clearing; that is, passed into the last stage of fermentation without the previous vinous and acetous stages. This is confirmed by a Portuguese authority: "A fermentação putrida tem mais lugar nas uvas doentes que nas sãas." *

My informants concur in stating that it is not easy to say whether the produce of diseased Grapes contains the customary quantity of *argol*, or tartaric acid, the deposit being in the usual course a work of time, and it does not seem that the wine was subjected to a chemical analysis with a view to ascertain the fact. A Portuguese authority, however, states that "Tartaric acid exists in diseased Grapes, as in healthy ones, when the fruit developes itself, but the comparative quantities have not yet been observed. In the sediment of wine produced from diseased Grapes, portions of tartrate of potash are found, as in that from healthy ones."

It follows, from what has gone before, that the quantity of spirit obtained by distillation is much smaller. The absence of healthy maturity, and of the saccharine principle in the diseased fruit, affords not the same matter for vinous fermentation, nor consequently for the production of brandy subsequently.

It is agreed that (as you surmised yourself) diseased Grapes, during the process of fermentation, emit a very

* "The putrid fermentation takes place more in diseased Grapes than in healthy ones."

nauseous smell, "especially (adds a Portuguese informant) when remedies of a sulphureous nature have been applied to them." The wine obtained from mildewed Grapes, even when they have been but slightly attacked, is very bad both in taste and smell, and this in spite of any after process to which it may be subjected. The effects of the disease are so summary and unequivocal as to leave no chance to the operations of doctoring.

In the mean while the island is fast going to ruin. In its best days it attained a degree of prosperity surpassing that of any other Portuguese colony, by its natural advantages, and in spite of a bad government and the usual influence of the Romish religion; but a still worse blight has come over it since 1852. The change in the condition of the chief landowner may be taken as a measure for that of the whole island. His income was at least 30,000*l.* a year in amount; it is now about 2000*l.* We have only to hope that vegetable pestilences may bear some analogy, in nature and duration, to the plagues and murrains of animal life, and that after running its course the Vine mildew may disappear.

The substitutes that have been proposed in Madeira for the Grape are by no means encouraging. The Sugar Cane flourishes, but it exhausts the soil, and requires hard labour and liberal reinforcements of manure—things which the Madeira people do not understand. Wheat has been grown, it is said, without any change, and without manure, for many years. The Coffee grown on the island is very good, but its cultivation is narrowly limited by locality and the means of irrigation. The Cactus which feeds the cochineal insect appears to flourish naturally in the most barren spots, and I understand that attempts are being made in that direction. *D.*

COMMON THINGS.

The Potato Onion is so called from its producing its crop generally under the surface, like a Potato; hence it is also called the under-ground Onion, and is never obtained from seed. There are several ways of cultivating it. The two following have been practised with success. The first is to dung and dig the ground well, and form beds four feet wide now, on each of which plant three rows, placing the roots ten inches apart, and inserting the bulb about half its depth in drills, drawn lengthwise on the beds to receive them. As they grow, earth them up like Potatoes; small bulbs become large ones, and produce offsets; the middle-sized and large ones, large clusters. Under this management 60 bulbs planted out in spring are reported to have produced 360 in the July following. The second method is, when the Onions have shot out their leaves to their full size, and when they begin to get a little brown at the top, to clear away all the soil from the bulb, down to the ring from whence proceed the roots, thus forming round each bulb a basin which catches the rain and water from the watering-pot. The old bulbs then immediately begin to form new ones, and if kept properly moist and the ground good, the clusters will be large and numerous, and bulbs grown thus above ground are said to be sounder than those grown below, and better keepers. The Potato Onion is very hardy, productive and of mild quality, equally so with the Spanish, and it comes into use earlier than any other sort.

Long and Short Prickly Cucumbers for Ridges.—These should be raised in frames now, and when large enough to transplant two or three plants should be put into a pot. They should be kept in the frames till they are strong enough to turn out under handglasses in the end of April for the first crop. For the last crop the seeds should be sown under the glasses in May and June. When the plants have grown long enough to train on the ridges, it is an advantage to cover the latter with clean straw, which keeps the sun from parching the ground, and prevents the blossoms and young fruit from being covered with soil during heavy rains. The covering the ridges with straw has also another advantage—that of preventing, in a great measure, the fruit from becoming spotted when the autumn is wet and cold. The thickness of the straw covering should not be less than two inches when pressed close to the ground.

Home Correspondence.

Pruning-knives.— Regarding the *Chronicle* as our floricultural *Times*, I rejoice to read your declaration of "war to the knife," and with it. Your comments, I trust, unlike the article in question, will "cut and come again." We have heard something of "the de'il among the tailors," but it really seems as though his evil presence had been transferred to the cutlers; and how guardsmen or gardeners are to prevail over their "Garden Battery" with such worthless blades, I know not. Why, every full grown Rose tree is now a Sebastopol, bristling, not with cannon, but with thorns; and we have not made our assault five minutes before we have to fall back upon our whetstones, and find ourselves and our weapon in the worst of tempers. If other amateurs share my tribulation, there can be no "needy knife-grinder" in the land. I have just now returned, utterly exhausted, from a single combat with H. C. General Jacqueminot; and my pruning-knife, I feel convinced, would be powerless upon a pat of butter. To add to my misery, all the time I was cutting and slashing, a gardener near me, with a knife of mediæval aspect, made the timber fly in all directions, whittling and whistling "Through the wood, laddie," with an occasional grin at his perspiring master. Oh! will not some benign florist tell where I may arm myself with a blade that will cut; and, *coute qu'il coute*, I will have that *couteau*. Surely it will not be necessary, as you darkly intimate, to go to the United States. If we country folk are startled when we hear, from time to time, that such and such a neighbour is "gone to town to have his hair cut," what will be our feelings of amazement when we are told that Mr. So-and-so has "sailed for New York with a view to buying a pruning-knife?" *S. R. H.*

Effect of the late Frost on Autumn-planted Potatoes.—I had about an acre of these, all of which are destroyed except a few small patches where the snow had drifted. I have been accustomed to ridge up the earth over the rows, which exposes more surface to the action of sun, air, &c., and places the sets a little farther from the frost. But this year I trenched them in, leaving a flat surface; had I, however, ridged the ground they would not have been saved this year, for Celery ridges that had no protection on them were frozen quite through, even below the trenches. In future I intend, whether I plant on the flat or ridged plan, to scatter some straw litter over the ground, which, should there be snow, will form a lodgment for it, and if not will prevent the frost from going so deeply into the ground. It is worthy of remark how little prevents snow from being drifted. I had a piece of Broccoli, which, after being attacked by the larks, were little more than stumps, yet the snow lay amongst them quite evenly, 2 or 3 inches deep, although the surrounding ground was bare. A very thin layer of snow prevents frost from penetrating the soil. *G. Lee, Clevedon.* [Mr. Lee confirms (what indeed requires no confirmation) Mr. Wilkinson's statement (see p. 174) that the Fluke Potato may be cut into sets like any other Potato.]

Hybrid Rhododendrons (*see p.* 190.)—Allow us to observe, in reply to "W. F.," that if he will favour us with a visit, we will show him a numerous progeny of hybrid Rhododendrons, of which ciliatum is one of the parents. We have not yet offered any for sale, but shall do so in due course. *Standish and Noble.*

Pregusata Fig. — A correspondent makes inquiry about the Pregusata Fig? I have had it several years without show of fruit until last season, when it put forth a second crop, and now promises well for this year. It appears to be one of the small sweet Mediterranean Figs, but the colour is not yet perceptible. *W.*

Supply of Water to Wells, Springs, Rivers, &c.—I have been often asked of late by persons who are aware of my investigation of the supply of water in the chalk stratum, "When shall we have water in our wells?" The answer is obvious, "When we have more rain or snow." But I find so much (if I may be permitted so to call it), ignorance on this subject, that I am induced to offer a few remarks upon it. In 1852 I registered 34 inches of rain, or 10 inches above the average of 24 inches. We know the effect of this on wells, springs, and rivers—the height of water in the one, and the volume of flow in the other was scarce ever exceeded in the memory of man. In 1853 I registered 26 inches, of which 24 fell before the first of November; from that date to the present, just 17 months, I registered 23 inches, or 1 inch below the average of 12 months. In that period only on two occasions has the quantity in 24 hours amounted to half an inch, and that in the hot months of July and August; hence the depression of wells, such as never, I believe, has been known. The present fall of snow, which has amounted to more than a foot in depth, equal to 1 inch of rain, will, I believe, produce a marked and almost immediate effect on the water in the chalk and elsewhere. If there is no frost to hinder the thaw, a rise may be looked for by the first of next month. I shall feel really obliged to any one who will note the rise of water in his well in the chalk or any other water-yielding stratum. It is but to measure to the water, and so note the rise; not to measure the depth of water in the well; this is best done by a wooden float attached to a string or measuring tape. *James C. Clutterbuck, Long Wittenham, Bucks.*

Nottingham Elms.—I have lately seen a distinct sort of Elm planted a good deal in the neighbourhood of Nottingham, and as it is quite different from, and I think very superior to any other variety I have seen, I should like to know if you are acquainted with it. Having made inquiries of the person on whose grounds they were growing, I found they had most, if not all, been procured at a nursery, under the name of "Siberian Elms." Is there such a thing? Mr. Lowe, of the Highfield House Observatory, has some growing in his park, I was told. As he has the reputation of paying great attention to nature perhaps he may know something about its origin. I called at the nursery and asked the proprietor where it had been procured; he told me it had been sold as an ornamental Elm by his grandfather, and had been propagated and sold regularly for at least 50 years, but that it was only lately that it had been much talked about; as to its real origin he knew nothing—"it had always been sold by that name." It is a graceful and delicate growing tree, and looks more like some of the pendulous English Elms one sees from the Eastern Counties line in passing through Hertfordshire, than any other I am acquainted with; the bark is almost as smooth as a Beech, the shoot so slender that it gives one the idea of being a slow grower, yet it is a plant of enormous growth; some of the trees I saw were wonderful specimens for the time they had been planted. I was shown some near Chilwell Hall, the residence of T. B. Charlton, Esq., planted alternately with a sort called the Giant Elm, and they had made quite double the wood in the time. As it does not sucker, I was told it did not require grafting, every cutting making a tree with a rapidity almost equal to a black Italian Poplar. By inserting this some information may, perhaps, be elicited. *A. B.*

May's Magnum Bonum Lettuce.—We have received two letters respecting this variety—one from Mr. Fitzsimon, of Reigate; the other from Mr. Mountford, of Kinmel Park, St. Asaph. The latter states that it is nothing more than the well-known Florence Cos, which, although a good summer Lettuce, is not equal to the Alphange Cos, which grows to a large size, requires tying, eats beautifully crisp, and continues a long time in use without running to seed. As a summer Lettuce he thinks the last-named variety has no equal. Mr. Fitzsimon says that May's Magnum Bonum has no right to the name of Bedale Hall, farther than that it may be cultivated there by Mr. Hewson, and that if he is rightly informed it was raised some 9 or 10 years ago by Mr. M'Donald, of Newton House, and went by his name in that neighbourhood. About seven years ago he saw it growing in the gardens at Brough Hall, where, as nearly as he can recollect, it was about 15 inches high by 10 inches through, beautifully blanched without tying, and felt in weight more like a well grown Cabbage than a Lettuce. He adds that it is an excellent variety. [Seeds sent to the Horticultural Society will show what this new name is worth.]

Swede Turnips as Food (*see p.* 174).—Permit me to say that if your York correspondent will slice his Swede Turnips a little thicker than a penny piece, he will find them done (boiled) in much less time than seven or eight hours, and also much better flavoured. *George Lee, Clevedon.*

Water Power and Glass Walls.—"S. N." asks for information as to the velocity to be given to a wheel six feet diameter by a certain amount of water. I believe a foot perpendicular of water will give 1 lb. pressure on the square inch. Allow me to direct your correspondent to the 26th number, page 223, of the "Engineers' and Machinists' Assistant," published by Blackie and Son, Warwick Square, London. Perhaps "S. N." will be kind enough to furnish me with some particulars as to his mode of constructing a glass wall. *William Edwards, Stamford.*

Societies.

Linnean, *March* 20.—The president in the chair. Samples of Kino from Nyami, Upper Gambia, were presented by Dr. Daniell; who also exhibited specimens of M. Masson's compressed vegetables, now being largely transmitted to the Crimea; these samples were from Messrs. Fortnum, Mason, and Co. N. B. Ward, Esq., exhibited autograph letters from Sir J. Franklin, Capt. Flinders, and Sir J. Banks, together with autographs of Tournefort and of the Jussieus, Antoine, Bernard, Antoine Laurent, and Adrien. Read a description of Peachia hastata, a new genus of zoophytes, with observations on the family Actiniadæ, by P. H. Gosse, Esq. It was stated that in January and again in March, 1853, the Rev. C. Kingsley found near Torquay an undescribed Actinia, which, in Mr. Gosse's view, constitutes a new genus. This he here proposes to call Peachia, and minutely describes. The peculiarities of the animal seem to reside in the mouth. From the mouth protrudes a singular organ, unlike any other belonging to this class of animals; it is a sort of fleshy proboscis, the top of which dilates into a clubbed head, divided into about 20 short papillæ. This curious apparatus, which appeared to form one side of the mouth, and to be in fact an enlargement of the lip at one part of the circumference, without anything corresponding to it on the opposite side, was perforate, and was supposed to lead down to the visceral cavity of the body external to the stomach, constituting the orifice through which the ova are ordinarily deposited. The animal appears to have a more than usually rapid and spasmodic power of retraction. The generic name is proposed as a tribute to the zeal, industry, and success with which marine zoology has been studied by Mr. Charles W. Peach. Mr. Gosse proceeded to revise the British species of the genus Actinia, and proposed to separate two new genera under the names of Sagartia and Bunodes. On this he remarks, "I hold that wherever we find several characters co-existent in a certain number of species, none of which are common to other species, the species possessing such characters ought to be elevated into the rank of a separate genus."

Caledonian Horticultural, *March* 10.—On this occasion the following prizes were awarded, viz.:—To Messrs. Dicksons & Co. for Hyacinths, La Tour d'Auvergne, Jenny Lind, Nimrod, Baron Von Tuyll, Voltaire, Prince Albert, Prince of Wales, and Grand Vidette (blue and white). Silver Medal to Mr. Hewison, gr. to C. K. Sivewright, Esq., for La Tour d'Auvergne, Lord Wellington, Prince Albert, Grand Lillas, Grand Vidette, and Amicus. One or two other collections of Hyacinths were also exhibited. Silver Medal to Mr. Smith, gr. to Viscount Melville, for a specimen Erica hyemalis. To Mr. Pender, Moreton, for Azalea Conqueror. To Mr. Edwards, Lauriston Castle, for clusters of Rhododendron Alta-clerense, Cinnamomeum, and Russellianum tigrinum. Silver Medal to the same for Cinnamomeum in pot. Camellias: 1st, Mr. Fowlis, gr. to J. Tytler, Esq., with Double White, Jeffersoni, Fimbriata, Pratti, Reine des Fleurs, and Imbricata. 2d, Mr. Mitchell, Ravelston, with Frankfurtensis, Fimbriata, Sweeti, Double White, Imbricata, and Traversi; 3d, Mr. Edwards, with Double

White, Imbricata, Fimbriata, Albertus, Candidissima, and Rosa Mundi. Cinerarias, 1st, Mr. Fowler, with Climax and Lady Jane. Stove or Greenhouse Plant: Silver Medal to Mr. Fowler, for Dendrobium nobile; 2d award to Mr. Cameron, for Boronia macrantha. For the finest two Spring-flowering Hardy Herbaceous Plants grown in pots the prize was awarded to Mr. Mitchell, for Epimedium violaceum, and Draba aizoides; 2d, Mr. Falconer, gr. to Mrs. Fraser, for Saxifraga oppositifolia, red and white varieties. Rhubarb: Mr. John H. Porterfield, with Victoria and Albert. Messrs. Dicksons and Co. exhibited (not for competition) a collection of Hyacinths; and Messrs. Cunningham, Fraser, and Co., a basket of Cyclamens. Messrs. Downie and Laird sent Hyacinths. From the garden of S. Hay, Esq., were Azaleas, Epacris miniata, and Rhododendron splendidum; from C. K. Sivewright, Esq., Hyacinths; from D. Anderson, Esq., Azalea Gledstanesi excelsa, and a dish of Mushrooms; from R. Girdwood, Esq., specimens of a new black Turnip grown at Corstorphine; and from Mr. Laing, Camellias and Rhododendrons.

Notices of Books.

The Golden Colony, or Victoria in 1854, with Remarks on the Geology of the Australian Gold Fields, by George Henry Wathen (Longmans), has been written with the object of giving emigrants to Australia a rapid but distinct impression of the aspect and condition of the land of their adoption; and of affording to the English public an opportunity of becoming better acquainted with the rise and progress of a colony which is destined one day to take a prominent place among the nations of the earth.

The portion of this book which will be read with most interest at the present time is that which traces the origin and history of the recent disturbances and loss of life at the gold fields. These riots are here attributed to the inequality and excessive amount of the gold tax; and the oppressive and un-English manner in which it is levied from a population naturally orderly, but particularly likely to resent every exercise of injustice or oppression. Were it not too serious a subject to be treated lightly, those persons who are now so loudly accusing all grades of government officials on this side of the water of ignorance and want of sympathy with the common business of life, and of too servile an adherence to forms even in great emergencies, might derive a sort of negative consolation from discovering here that they are not worse off in these respects than their fellow countrymen at the antipodes, who suffer severely from the same causes.

The scenery is graphically described and illustrated by the author's sketches. The different phases in the wild life at the gold fields are brought out with considerable effect, and disclose a state of manners, which by its strong contrast with what we ordinarily witness in England will add considerably to the interest with which this book will be perused.

Hints on Village Architecture, &c. (By H. Weaver. Large 4to, Hollway, Bath; Pope, London), forms a thin volume 13 by 17 inches, and contains 10 lithographed drawings representing seven designs for Rural Schools, Labourers' Cottages, and Parsonage Houses, with rough estimates of their cost. Those who wish to be their own architects may gather useful hints from Mr. Weaver's plans, which are made with a view to economy and convenience rather than architectural effect—a result, however, in some cases not unskilfully obtained. Internal arrangements offer no ground for criticism because we do not know the precise objects or fancies of those for whom the designs were made; upon the whole they have produced a favourable impression upon us, and may be taken as good general guides, to be neglected or improved upon as circumstances may require.

The Ferns of Great Britain, illustrated by J. E. Sowerby (8vo, with 49 coloured plates; 27*s.*), has been already noticed at pp. 502, 631 of our last year's volume. We have only now to announce its completion in a thin volume, the plates of which are neatly drawn and coloured, and give a good idea of the plants represented. The letterpress, by Mr. Johnson, of Guy's Hospital, is well written and instructive, and includes good practical directions for cultivation.

Our Heroes of the Crimea (Routledge. 1*s.*). Under this name Mr. Ryan has given hasty but graphic, and we believe authentic, sketches of the lives of some of the gallant spirits who have fallen under, and of others who still survive, the perils of the Crimean campaign. He writes like a soldier, with force and spirit. Of course, he takes the popular view of the great question of army promotion, the working of which under existing regulations he boldly exemplifies in the well-known case of one of the most distinguished modern generals, Sir de Lacy Evans.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—It will be satisfactory to know that the injuries inflicted on out-door vegetation in this establishment have been fewer and less severe than might have been expected, considering the kind of winter we have had, and which has not even yet left us; for on the morning of Monday last the thermometer fell 14° below freezing. On the conservative wall the foliage and unripe wood of many of the more tender things have been browned; but as far as can be judged at present, little has been entirely killed. The New Zealand Podocarpus Totara has had its leaves destroyed, as have also different kinds of Duvaua, Ceanothus divaricatus, C. papillosus, and C. dentatus. The same misfortune has likewise befallen Spiræa Reevesiana, Escallonia rubra, Berberis hypoleuca, B. dealbata, and B. aristata. B. tinctoria has apparently been killed, while in another part of the grounds, away from a wall, the handsome Darwin Barberry has withstood the frost unhurt.

As regards other plants on the conservative wall, the New Holland Eucalyptus coccifera has escaped injury, as has also Mr. Fortune's Jasminum nudiflorum, which has been for some time past, and is even now producing a tolerable crop of round bright yellow Primrose-like blossoms. Prunus sinensis, the single pink kind, has had its leaves browned, as have also the common Myrtle, and Solanum crispum. From the above it will be seen that what injury has been committed has mostly been confined to the foliage and young tops of shoots, which when removed will leave the plants in comparatively good condition for making new wood and leaves for the coming season.

In the open ground the trees that have suffered most are the Mexican Pines—apulcensis, macrophylla, Teocote, Devoniana, Russelliana, and patula, which sustained so much injury last spring. These have apparently been killed, while even the long leaves of P. Lindleyana have escaped almost untouched. This fine species must therefore be pronounced to be perfectly hardy, as are also P. cembröides, P. Montezumæ, and the Californian species radiata, muricata, and tuberculata. P. monticola likewise stands well. P. orizabæ has had its leaves killed. Fitz-Roya patagonica has sustained no injury, nor has the Crimean Abies Nordmanniana. Libocedrus chilensis has had its foliage browned. Cupressus australis has been hurt a little, and it is probable that portions of some plants of C. Goveniana may turn out to be dead, though that cannot be correctly ascertained at present. The Pampas Grass has been thoroughly blanched, but it is to be hoped not killed. The Chusan Palm has likewise been a good deal injured; but it may yet recover. The Californian Cherry (Cerasus ilicifolia) has had its foliage browned. Camellias, fine bushes of which have been growing on the north side of a wall for years, have stood the frost well, only one or two of them having had their foliage hurt. The majority of them are quite uninjured, and as green and healthy as in the month of June or July. Among Sikkim Rhododendrons, ciliatum, alpinum, and cinnabarinum are quite safe, while some of the hybrids from arboreum have had their leaves somewhat browned. Benthamia fragifera has been killed to the ground; Laurus regalis has had its top hurt; Quercus Cooki has lost its foliage, and Garrya macrophylla appears to be at least three parts dead. Among hardy Berberries must be mentioned Mr. Rivers's hybrid, between fascicularis and aquifolium, which must be set down as a valuable evergreen shrub, and quite hardy. Magnolias have stood well, except the narrow-leaved variety of grandiflora, which is a little browned. Laurustinus and Bays have suffered but little; in fact, as we have already hinted, the garden altogether looks about as well now as it usually does at the close of much milder winters. This may be attributed, in a great measure, perhaps, to the wood having been well ripened last year.

Owing to the continued coldness of the weather vegetation has made but little progress as yet, and if it were not for the gaiety of the Crocuses in the beds on the west side of the arboretum, and the increased greenness of the Grass in that department, it would scarcely be known that spring had yet set in. Fruit trees of all kinds show well for a good crop, which the backward state of the bloom buds will help to secure. Nine-inch wide coping boards have just been fixed on the Peach wall, and even above Pears the same kind of coping boards are about to be placed.

As regards routine operations, pruning and nailing are now nearly finished, and in the kitchen garden the getting in of seeds, &c., chiefly occupies attention.

Under glass little alteration has taken place since our last report.

IMPERIAL AND CENTRAL HORTICULTURAL SOCIETY OF PARIS.

We have received the following regulations for the exhibitions of the present year:—

REGLEMENT DE L'EXPOSITION UNIVERSELLE.

Article Premier. La Société impériale et centrale d'horticulture ouvrira, 1er mai 1855, une exposition permanente et universelle des produits de l'horticulture; elle sera close le 31 octobre suivant.

Art. 2. Cette exposition sera établie aux Champs-Elysées, sur le carré de l'Elysée.

Art. 3. Pourront être admis à cette exposition les plantes, arbres, arbrisseaux et arbustes de tout genre et de toute espèce, fleuris ou non, les légumes et fruits forcés ou cultivés naturellement, et les objets d'art et d'industrie ayant un rapport direct à l'horticulture.

Art. 4. Les horticulteurs et amateurs français et étrangers qui voudront concourir à cette exhibition sont invités à faire parvenir, dans le plus bref délai, à M. le Secrétaire de la commission d'organisation, rue du Cherche-Midi, 17, une demande d'exposition qui devra contenir:—1° La nature et la quantité des produits qu'ils se proposent d'envoyer; 2° L'emplacement qui leur sera nécessaire; 3° L'époque à laquelle ces produits pourront être exposés; 4° Le temps qu'ils pourront séjourner à l'exposition; 5° Toutes autres indications qui pourraient être nécessaires.

Art. 5. Aucune demande ne pourra être admise, si elle n'est parvenue au secrétariat de la commission quinze jours au moins avant l'ouverture. Dans le cours de l'exposition, les demandes devront être adressées huit jours à l'avance.

Art. 6. En réponse à ces demandes, la Commission d'organisation fera connaître:—1° Le nombre des produits qui pourront être admis; 2° L'emplacement accordé; 3° L'époque précise à laquelle les produits peuvent être admis. Elle adressera, en outre, en triple expédition, un bulletin d'admission, sur lequel seront indiqués le nom et la demeure de l'exposant, la nature et le nombre des produits admis.

Art. 7. Tous les produits destinés à l'exposition de la Société impériale et centrale d'horticulture devront être adressés, francs de port, à MM. les Commissaires de l'exposition universelle d'horticulture (voir le modèle d'adresse ci-dessous).

A Messieurs
les Commissaires de l'exposition universelle
d'horticulture,
carré de l'Elysée, aux Champs-Elysées.
A Paris.

Envoi de (nom et prénoms de l'exposant ou raison sociale) demeurant à (résidence ou siége de l'établissement), exposant de (nature du produit).

Art. 8. Chaque colis portera une adresse semblable qui mentionnera, en outre, l'indication:—1° Du lieu d'expédition; 2° Du nom de l'exposant; 3° L'espèce des produits inclus. Il sera, de plus, accompagné du bulletin d'admission, indiqué art. 6.

Art. 9. Les colis contenant les produits de plusieurs Exposants porteront, de plus, sur leur adresse, les noms de ces Exposants, et seront accompagnés d'un bulletin d'admission pour chacun d'eux.

Art. 10. Par une concession faite à la Société impériale et centrale d'horticulture par les compagnies des chemins de fer du Nord, de l'Est, de Lyon, d'Orléans, de l'Ouest, de Rouen, Havre et Dieppe, de Saint-Germain, de la Méditerranée, du Midi et du Grand central, les produits destinés à l'Exposition de l'horticulture jouiront, sur les tarifs, de la réduction accordée aux produits destinés à l'exposition universelle de l'industrie. Cette réduction ne sera accordée que sur la présentation de leur bulletin d'admission. Ce bulletin d'admission devra être remis en double, avec les colis, entre les mains de MM. les agents des compagnies des chemins de fer; tous les frais de transport devront, en outre, être acquittés au départ.

Art. 11. Les produits venant de l'étranger et destinés à l'exposition de l'horticulture seront admis en pleine et entière franchise de tous droits. Ces produits, accompagnés d'un bulletin d'admission, entreront par les villes et ports ci-après:—Lille, Valenciennes, Forbach, Wissembourg, Strasbourg, Saint-Louis, les Verrières-de-Joux, Pont-de-Beauvoisin, Chaparellan, Saint-Laurent-du-Var, Marseille, Cette, Port Vendres, Perpignan Bayonne, Bordeaux, Nantes, Boulogne, Calais et Dunkerque.

Art. 12. Ils jouiront, à partir de la frontière, de la réduction indiquée art. 10.

Art. 13. L'admission des produits à l'Exposition est gratuite, et les Exposants ne sont assujettis à aucune rétribution, de quelque nature qu'elle puisse être.

Art. 14. La Commission d'organisation de l'Exposition est chargée de recevoir, déballer et disposer les objets à l'Exposition. L'ouverture des colis se fera en sa présence; elle en constatera l'état, et dressera un procès-verbal des avaries qui pourraient y être survenues. En cas d'avaries graves, copie du procès-verbal sera immédiatement expédiée à l'Exposant par les soins de la Commission.

Art. 15. Toutes les plantes ou objets exposés devront être munis d'une étiquette lisible et correcte, indiquant leur nom. MM. les Commissaires placeront sur chaque lot une étiquette indicative du nom, de la profession et de l'adresse de l'Exposant.

Art. 16. Les produits exposés seront placés soit dans des serres de différentes températures et pourvues d'appareil de chauffage, soit sous des tentes ou autres abris les plus convenables à assurer leur conservation. Leur entretien sera confié à des jardiniers spéciaux attachés à l'Exposition et placés sous la surveillance de la Commission.

Art. 17. Chaque Exposant aura la faculté de faire garder ses produits, à l'Exposition, par un représentant de son choix. Déclaration devra être faite, dès le début, du nom et de la qualité de ce représentant; il lui sera délivré une carte d'entrée personnelle, pour le temps que durera l'exposition de ces produits; cette carte ne pourra être ni cédée ni prêtée à aucune période de l'Exposition, sous peine de retrait.

Art. 18. Les représentants des Exposants devront se borner à répondre aux questions qui leur seront faites, et à délivrer des adresses, prospectus ou prix courants qui leur seront demandés. Il leur sera interdit, sous peine d'exclusion, de solliciter l'attention des visiteurs, ou de les engager à acheter les objets exposés.

Art. 19. La Commission veillera, avec la plus grande sollicitude, à la garde des objets expédiés; mais elle ne sera responsable ni des avaries, ni des vols ou détournements qui pourraient être commis.

Art. 20. Dans le cas de vente des produits exposés, ils ne seront livrés qu'à l'expiration du temps fixé pour leur exposition.

Art. 21. L'appréciation et le jugement des produits exposés seront confiés à un Jury composé de trente-six membres titulaires et de douze suppléants. Ce Jury, choisi par la Société, sera divisé en six sections; chacune de six membres titulaires et de deux suppléants, et présidé par un des Vice-présidents de la Société. Chaque section fonctionne alternativement et sous la présidence du Vice-président ou celle d'un Membre délégué pour le remplacer.

Art. 22. Chaque produit exposé sera, pendant la durée de son exposition, l'objet d'un examen par la section de service, qui en dressera un procès-verbal.

Art 23. Ces procès-verbaux seront revus, et les récompenses déterminées par le Jury, toutes sections réunies, sous la présidence du Président de la Société.

Art. 24. Des médailles seront données en récompense, et les Exposants récompensés recevront, à titre de prime, le remboursement des frais qu'ils auront faits pour le transport, aller et retour, de leurs produits sur le territoire français.

Le Secrétaire de la commission. LÉON LE GUAY. — *Le Président de la commission.* COMTE DE MORNY.

FLORICULTURE.

Pyramidal Fuchsias.—As the Fuchsia has now been brought to great perfection both in shape and colour, a few remarks on the mode of culture which I have pursued may perhaps be of use to the amateur in enabling him to produce pyramidal plants as fine and in as short a time as the most experienced practical gardener. The system I adopt is as follows: I put a few old plants in a warm pit or Vinery where the temperature ranges about 55°, about the end of January or beginning of February, in order that they may have pushed out plenty of young wood by the middle of March. I then take off what cuttings I can get from each sort, preferring the shortest-jointed wood. First prepare as many 4-inch pots as you may require, taking care that the pots are well drained, and the compost of a sharp open nature—coarse brown river sand and a little leaf-soil well intermixed will be found to suit very well, with about an inch of silver sand on the top, which will enable the cuttings to emit roots more freely. Water gently with a fine-rosed pot, then plunge the

pots in the propagating pit, where there is a gentle moist bottom-heat, where in the course of three weeks they will have made roots enough to stand potting off. You may now pot off singly into 3-inch pots in a light open sifted compost of rich loam, leaf-soil, and sand, equal parts, and if you have any bottom-heat to spare they will be the better to be plunged in it for a day or two, to give the young roots a start. They may now be removed to a warm pit or Vinery, or whatever you find most convenient, where the atmosphere is kept moist, which will ensure a strong, healthy, and vigorous growth. When you find the pots full of roots repot into 6-inch pots, using for this shift a good rich compost of turfy loam two parts, one of old rotten cow droppings, leaf soil and sand. As this will be their last shift this season, care must be taken to provide good drainage; this can be secured by putting in plenty of potsherds, with two or three bits of open turf or Moss over all. As the plants will now be pushing strongly, they must be tied to a neat stake, as they will be sending out laterals or side shoots. As the making of these side branches secures the formation of the plant, a little weak sheep dung liquid manure will be found very beneficial at this period of their growth. As the first tier of laterals has made their first joint, pinch it at that; this will not only enable you to have two shoots from each lateral, but will cause the leader to push away, and furnish you with plenty of side wood. The four first tiers of laterals will be enough to pinch this season, the rest may be allowed to grow on. They will be forming nice little plants now, so they may as well be taken to the greenhouse or conservatory, where, with a gay profusion of flowers, they will assist in keeping the house "dressy" for a short time. By the middle of November water should be withheld gradually, in order to ripen the wood, and they may be placed in a dry cold pit, or any out of the way place, such as under the greenhouse stage, for instance, where they must remain all winter, as they will require no more attention till the end of February, when a little water may be applied sparingly to induce them to start; the knife must now be applied to cut back the side shoots that were pinched last year, to the second joint on the wood they made after they were pinched, and a couple of tiers of single shoots to the second joint, the rest to the first, and the leader to within four inches; thus you will have a pyramidal basis to work on. Place them now in a warm vinery, and they will soon show indications of rapid growth. After they are fairly started turn them out of their pots, and shake off all loose soil, and examine the roots; repot now in 10-inch pots, using strong fibry loam of a rich texture, old cow dung, leaf soil and sand, equal parts well mixed. As stated for last season, attend well to drainage, as they will require no more pot room this season; replace them again in heat, and pinch in according to the directions laid down for last season, always aiming at having the plant broad and full at the pot, and tapering to the top. Pinching should, however, be stopped after the 1st of June, for by the middle of the month they should get a prominent place in the conservatory, where, by July, they will be the objects of greatest admiration in the house; liquid manure must not be omitted upon any account, at least three times a week, as this is now the only thing the plant will derive its nourishment from, and will cause it to bloom right on till October, when it will be getting unsightly, and may be removed out of doors to make room for some other favourite. When cold nights set in remove them as before to a cold pit, &c. No more attention will be necessary till spring, when they may be pruned and started according to the time they are wanted in bloom. They can be had in bloom by putting a few into heat by the beginning of January, about the middle of May; others, started accordingly, will enable you to have them in flower all the summer. *W. F.*

SEEDLINGS.

Cinerarias: *E J. and G R., &c.* All inferior to varieties possessing the same colours now in cultivation.

Epacrises: *F A D and Sons.* All handsome, but no improvement on kinds already in existence.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—If the pruning of any of the more tender climbers has not yet been done, it should be seen to at once, for growth will now be commencing, and such things ought not to have their growth retarded by any means. Also see that the soil about the roots of creepers is in a nice moist healthy state, as also the beds and the borders; and where it is found too dry give two or three liberal soakings at intervals of a few days, for as the water is apt to pass off through the crevices or fissures, it is hardly possible to thoroughly moisten any bulk of soil by one application. See that Orange trees, &c., are free from insects, and that their foliage is free from dust and other impurities. These will soon be coming into flower, and will be objects of considerable attraction; hence they should be in perfect order.

FLOWER GARDEN AND SHRUBBERIES.

If not already done, the walks, &c., should be edged and fresh gravel put on where wanted so as to put them into proper order for the season. The turf should also be well rolled and made smooth and firm, without loss of time, for notwithstanding the cold state of the weather the Grass shows that the work of mowing must soon be commenced. And it is a great saving of after labour to take time by the forelock in this matter, for when the first mowing is deferred until the Grass gets too long, the turf becomes spongy, and if it is once allowed to get in this state it is much more difficult to mow, and can hardly be got into "good keeping" without cutting it up so as to make it present a brown and very unsightly appearance. Attend carefully to the stock of bedding-out plants, and get rooted cuttings potted off as soon as they are fit, and encourage them by kind treatment to make free growth, for after this season there is no time to be lost with young stock.

FORCING DEPARTMENT.

Pineries.—Look over young growing stock, occasionally examining and repotting such as are found to be in want of more pot room, and avoid the old injudicious practice of repotting the whole stock at once, irrespective of the state of the roots, than which nothing can be more improper, particularly where a constant succession of fruit is an object. Pines, like other plants, are checked in their growth by allowing the roots to get too much matted before repotting, hence every plant should be shifted before it suffers for the want of pot room, and no plant should be repotted until the state of its roots indicate that more pot room is required. This requires rather more time and attention than the old practice of repotting all in one day, but the result fully repays the extra trouble, &c. The temperature may be slightly advanced as the amount of light increases, but this is a matter in which the state of the plants will be the best guide. Aim at securing strong dwarf plants, with a free habit of growth; and if this is obtained, it is immaterial whether the night temperature is 60° or 70°, and very much will depend upon circumstances as to which will be proper. Plants that may be unhealthy and in an unkind state, if kept near the glass, will be benefitted by a considerable higher temperature than would be suitable for others in a free state of growth. These are circumstances, however, which can be properly judged of only by those in care of the plants, but they are easily understood by a little careful observation. Use very means to induce a vigorous root action, and if this is obtained free strong growth will result with otherwise ordinary care only. Vineries.—See that Vines starting into growth are tied up in their places before the shoots get so long as to be liable to be broken off in the operation. Syringe frequently until the leaves begin to unfold; but use the syringe sparingly after that is the case, and only on the afternoons of bright days. Where the buds do not promise to break regularly bend the Vines so as to place those that are backward in the most likely position to catch the sap, and this should be done directly any indications of their breaking irregularly are observed. If any of the bunches in houses where the berries are stoned look as if they would be improved by a few more berries being cut out, let this be done at once, so as to allow those left plenty of room, and also to avoid having to handle the fruit after it begins to colour. Give air as freely as the state of the weather will admit, using a little extra fire heat, and leaving a little air on at night, so as to prevent the bloom being injured by damp settling on the berries, as is apt to be the case where the house is shut up. Figs.—Where the early crop is approaching maturity the borders should be well watered, so as to avoid the necessity of having to water the soil after the fruit begins to ripen, which is injurious to the flavour, and is also apt to cause the fruit to burst prematurely, particularly if the trees have been rather dry at the root previously. So far as the present crop is concerned the trees can, perhaps, hardly be too dry at the root, while the fruit is ripening, but where a second crop is expected care must be exercised to keep the trees in health, and to prevent the foliage becoming a prey to red spider, otherwise the second crop can hardly be expected to be good for much. Use the syringe vigorously, and maintain a moist atmosphere as long as this can be done without risk of injuring the fruit. Also keep the young wood thin and regularly tied in, stopping before the fourth or fifth leaf, according to the strength of the shoots, &c. Melons.—Encourage those newly planted-out with a moist warm atmosphere, so as to get them into full growth as quickly as possible; but plants that are fairly established should be kept cooler, admitting air on every favourable opportunity, in order to secure short-jointed fruitful wood. Keep the shoots thin and regular, pinching out any not wanted, but avoid stopping the main shoots until they reach the sides of the pit, when by pinching out the points the laterals will start into growth and show fruit abundantly; and by this time the plants will have gained sufficient strength to set and carry a fair crop. Do not exceed 65° at night, and admit air when the glass rises to 75°, but do this very carefully on cold days. Endeavour to maintain a steady bottom-heat of about 80° or 85°, and keep the soil in a healthy state as to moisture. See to providing plenty of young plants for succession crops.

HARDY FRUIT AND KITCHEN GARDEN.

The protection of the blossoms of fruit trees will soon require attention, and we have found Hall's nets to answer admirably for this purpose. If expense is no consideration, there can be little doubt but that the preference should be given to woollen net, as being the most effective protection, and likely to last longer than any material made of cotton. But the woollen net which was used so successfully by Mr. Harrison, of Snelston Hall, costs 10*d.* per square yard, while Hall's No. 1 costs a fraction less than 4*d.*, and this quality seems sufficiently strong to last well, and is as close in the mesh as we think anything for being permanently fixed while the trees are in bloom should be. The woollen net used by Mr. Harrison when made up for use, with calico at top and bottom (making it 3 yards wide), costs 1*s.* 10½*d.* per yard along the wall, exclusive of making; and Hall's, made up in the same manner, would cost less than the 10½*d.*, which is a most important difference where any considerable length of wall has to be covered. But where the materials for protection have still to be procured, there is no time to be lost, and whatever material may be decided upon should be obtained at once and made up ready for use. The main crop of Carrots should be sown at once, choosing a fine day when the ground is in a dry state, to prevent the surface being rendered hard by the treading.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

For the week ending March 29, 1855, as observed at the Horticultural Gardens.

Thurs. 29	11	30.434	30.420	44	25	34.5	40	41	N.E.
Average.		29.749	29.513	42.8	26	34.4	40.0	40.7	

March 23—Densely clouded; cloudy and cold; slight frost.
— 24—Cloudy; overcast; frosty at night.
— 25—Fine throughout; sharp frost.
— 26—Clear and frosty; very fine; cloudy; fine.
— 27—Overcast; very fine; clear at night.
— 28—Drizzly thick haze; constant rain, yet barometer rising rapidly.
— 29—Overcast; cloudy; clear and fine.

Mean temperature of the week 8 deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,

During the last 29 years, for the ensuing week, ending April 7, 1855.

April.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 1	55.1	35.0	45.0	15	0.76 in.	3	5	3	3	3	7	[illegible]	[illegible]
Mon. 2	55.5	36.3	45.9	12	1.19	4	3	4	2	3	[illegible]	1	3

Thurs. 5	56.7	35.8	46.2	14	0.65	—	5	3	1	2	5	[illegible]	[illegible]
Friday 6	56.5	36.4	46.4	11	0.30	3	3	2	1	4	2	1	—
Satur. 7	57.0	36.9	46.9	13	0.40	2	7	2	2	1	2	1	—

The highest temperature during the above period occurred on the 2[illegible] 1848—therm. 78 deg.; and the lowest on the 1st, 1838—therm. 16 deg.

Notices to Correspondents.

Alpine Rose: *Sub.* It is a hardy shrub, and requires the same treatment as any other hardy Rose. It is not worth cultivation except in botanical gardens. Heat your greenhouse with hot water.‡

Books: *A W.* Koch's "Flora Germanica."

Canker: *Aleph.* We will endeavour to procure you some information by next Saturday. If it is really canker, the disease is, we believe, incurable.

Conifers: *A Constant Reader.* Such land as you describe will suit them well. It is impossible for us to say what is hardy or the contrary in a situation of which we do not even know the name. All N. European, Siberian, Himalayan, Japanese, and American species from above the latitude of South California, and all the Real del Monte species, are hardy in our situations. Certainly make walks through your Pinetum, and plant evergreens—if with gay flowers so much the better—by their side. For other matters you had better consult your gardener, who of course understands such questions. Larches are the best nurses.—*W A.* They ought not to be grafted. Grafted plants are worthless. We decline to instruct you how to do that which ought not to be done. If you are a gardener of course you do not want to be told how to perform the ordinary work belonging to your business.

Dioscorea Batatas: *S S.* The small tubers should be planted whole. As to its treatment, the best information you can have will be found at p. 19 of our present year's volume, and in a pamphlet on the subject, published by Mr. Henderson, of Kingskerswell, Newton Abbot, Devon.‡

Ferns: *Sub.* Next week.

Gas Tar: *Alnus.* There is no objection to gas-tar as an application to tree *guards* in a park, though there is to putting it on trees themselves. You will not find any other substitute for paint than tar of some kind. We prefer to gas-tar Stockholm tar mixed with a small quantity of pitch and resin—although it is a little dearer. The mixture used in the navy is the best.

Haricot Beans: *C F L.* The common white Dutch runner Kidney Bean is one of the eatable Haricots of the French; but they cultivate several other more delicate white-seeded sorts.

Names of Plants: We have been so often obliged to reiterate our decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J S W.* One of the many varieties of Amaryllis Johnsoni.

Osage Orange: *U M.* Certainly it might be transplanted when 4 feet high; but it should be done as soon as the leaves have fallen in autumn.‡

Physiology: *W S.* We are unable to discover anything unusual in your inarched Vine. Had the result been different it might have been extraordinary. All that the experiment amounts to is, that a graft with a long heel will grow as well as a graft without a heel.

Plants for Baskets: *Reader.* Cyanotis vittata, commonly called Tradescantia zebrina, will possibly answer your purpose best.‡

Potatoes: *Northwood.* Your question was answered immediately, see p. 176, bottom of third column. Bees prefer making their own comb.‡

Rhubarb: *A Subscriber* will be obliged by any of our readers furnishing him with some explanation of the following circumstances. He says, "My gardener, last October, covered over some roots of Rhubarb with cement casks, and fold-yard manure, which was added several times in order to force the growth. Again, three weeks ago he covered over, in a precisely similar way, other roots on the same soil, and those covered *the last* are ready *the first.* How is that?"

Strawberries: *H H.* You may obtain a late crop: 1, by growing Alpines; 2, by turning out in a warm place the pots which were forced very early; 3, by picking off all the flowers that appear up to the middle of July.

Vine Leaves: *L P.* They are not mildewed, nor is it possible to say what ails them without inspecting the house. Have your flues burst? or are they cracked? or have you been doing anything to your border?

Water Melons: *Sub.* They should be cultivated in the same way as other Melons.‡

Misc.: *H W.* Our agent will supply you with the paper. The numbers can be had.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

ESTABLISHED 1850.

THE NITRO-ORGANIC MANURE COMPANY,
(Late the Manchester Sewage Guano Company),

Have much pleasure in informing their Friends and Agriculturists generally, that in order to secure the most complete arrangements in all the Chemical Processes in the Manufacture of their Manures, they have engaged the professional services of Dr. EDWARD FRANKLAND, F.R.S., F.C.S., Professor of Chemistry at Owen's College, Manchester, to analyse all the various Manures made daily at their Works, and they have empowered him to reject every portion which is not found to be of the full standard quality. This arrangement will secure to all their customers a standard and uniform manure, of equal or greater value (in proportion to its cost) than foreign guano, and on which agriculturists may confidently rely.

The Nitro-Organic Manures are a Compost of Blood, Bones, Urine, Nightsoil, and other animal matters, and highly fertilising Chemical Ingredients, which, in a concentrated state, are incorporated with prepared Charcoal, and forming dry portable manures, which enrich the land for several years after they are applied. They may be used in all cases, exactly the same as Peruvian Guano, *at equal cost per acre.*

For top-dressing, the Manure is recommended to be applied in all cases in wet or showery weather. If convenient, the Nitro-Organic Manures may be used with very beneficial effect along with a small dressing of common farm-yard manure, or nightsoil, in which form they have been strongly recommended.

PRICES OF THE NITRO-ORGANIC MANURES.

For Grass, Clover, &c.	£5	5	0	per ton.
For Wheat, Oats, Barley, Rye, &c.... ...	6	6	0	"
For Turnips, Mangold Wurzel, & Potatoes	6	6	0	"
Deodorising Charcoal...	1	10	0	"

TERMS—Net Cash on delivery; Carriage Free to any Railway Station or Canal Wharf in Manchester.
JOHN THOMPSON, Secretary.
3, Watling Street, Shudehill, Manchester, March, 1855.
** The use of Sewage having for some time been discontinued, the opportunity presented by a change in the late Company has been taken to alter the name to one more characteristic of the actual constituents of the Manure.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.

Trustees.
Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.

Directors.
Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.

Edward Bell, Esq., Tottenham, Middlesex.
John Clayden, Esq., Littlebury, Essex.
Richard Hunt, Esq., Stanstead Abbot, Herts.
Thomas Knight, Esq., Edmonton, Middlesex.
Robert Leeds, Esq., West Lexham, Norfolk.
Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Thomas Nash, Esq., Great Chesterford, Essex.
James Odams, Esq., Bishop Stortford, Herts.

John Collins, Esq., Middleton Square, Pentonville.
With power to add to their number.
Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.
MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.

They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have proposed to make one possessing similar qualities. As security, therefore, to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7*l.* 10*s.* per ton.

Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, or sown broadcast; if the latter, it should be well harrowed in. Turnip Manure, 6*l.* 10*s.* per ton.

Delivered at any Railway Station or Wharf in London.

Applications to be made to ODAMS, PICKFORD, & KEEN Agents for the above, 35, Leadenhall Street, London.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
OFFICES, 37, CHARING CROSS, LONDON.
Directors.

The Hon. J. W. Fortescue.	General Macdonald, C.B.
G. P. Irvine, Esq.	Newton S. Scott, Esq.

Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Solicitors—Messrs. Vallance & Vallance, 20, Essex Street, Strand.
Agricultural Chemist—William White, Esq.
Secretary—Mr. W. F. Mould.

The Directors invite the attention of landed proprietors, agriculturists, &c., to the Patent Cyanic Manure, as containing the most approved elements of fertilisation in their just proportions; it can be, therefore, confidently recommended as a very superior dressing for Wheat, Barley, Oats, Clover, Grass, &c. Price 8*l.* per ton.

Prospectuses (with practical directions for use) may be had on application, or will be forwarded by post.

All orders, applications for Agencies, &c., to be addressed to the Secretary, at the offices of the Company, 37, Charing Cross.

TO MANURE MAKERS AND FARMERS.

SULPHATE OR MURIATE OF AMMONIA.—These powerful fertilisers, genuine as manufactured, may be had in any quantities from READ HOLLIDAY, Ammonia and Soda Works, Huddersfield.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

PERMANENT PASTURE.

H. R. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., &c., to lay down Land to Permanent Pasture, at 25*s.* per acre, allowing three bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Great improvement may be effected by sowing 8 to 12lbs. per acre of SUTTON'S Renovating Seeds, which consist of Perennial Clovers and Grasses of the finer kinds for improving the bottom.

An increase of several Tons of Hay per acre has been thus effected on many Meadows and Upland Pastures. The Seeds should be sown early.

The drought of last summer having caused partial failures in the ordinary Grass and Clover Leys, SUTTON'S Renovating Grass Seeds may be sown with great advantage *in all such cases.* PRICE REDUCED TO **9d.** PER POUND.

SUTTON & SONS *also supply Grass Seeds for laying down Land to Permanent Pasture at a moderate expense, the sorts being selected in accordance with the nature of the soil to be laid down, particulars of which may be obtained by post.*

Goods delivered Carriage Free by Rail.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

FARM SEEDS.

W. DRUMMOND AND SONS have implicit confidence in recommending the following Seeds:—

PERENNIAL RYE-GRASS, from the most select growths, and perfectly clean.

ITALIAN RYE-GRASS, direct from Lombardy, and through the same gentleman in that country who has for several years been employed by us in collecting those fine parcels which have hitherto given so much satisfaction to our customers.

GRASSES FOR PERMANENT PASTURE.—*Having been among the first to recommend the use of the* NATURAL GRASSES *in the formation of* PERMANENT PASTURE, *the subject has occupied a large share of our attention. We have carefully noted the species composing the best Natural Pastures, and the results of combinations in culture under varied circumstances of soil and situation; and, as the result of our observations, as well as from the great satisfaction our selections have given, we feel warranted in recommending, in addition to the Grasses usually sown, a variety of such species as are known, not only to yield the greatest bulk of herbage, but the largest amount of milking and feeding properties, varying those species, and the proportions of each, according to the nature of the land to be laid down.* From the increased demand, we are enabled to charge a lower price than formerly. An excellent assortment, and allowing a *liberal supply* of Seeds, may be had at from 24*s.* to 26*s.* per statute acre.

TURNIP, in all the leading varieties, saved by ourselves from full-formed Bulbs.

VETCHES (or TARES), large broad-leaved, a very superior sort.

Priced Lists of the above, with every other description of Farm Seeds, may be had post free on application.

FREE DELIVERY.—All Parcels of Seeds above 2*l.* value (with the exception of Grain and Vetches), delivered free in London, Liverpool, Hull, Newcastle, Belfast, Londonderry, Aberdeen, Inverness, and to all the Stations along the Lines of the Caledonian and North British Railways, &c.

W. DRUMMOND & SONS, Seed and Implement Warehouse, Stirling, N.B.

SEEDS CARRIAGE FREE.

AGRICULTURAL SEEDS.—*Landed Proprietors and Farmers who require* LARGE QUANTITIES *of Turnip, Mangold Wurzel, Carrot, or any other kinds of Agricultural Seeds, will be supplied on the most liberal terms.*—Apply to
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

NEW SEEDS, CARRIAGE FREE.

		Per lb.—	*s.*	*d.*
White Belgian Carrot			2	0
Yellow Globe Mangold Wurzel			1	0
Morton's Yellow Globe do....			1	6
Fisher Hobbs' Yellow Globe do.			1	6
Elvetham Long Red do.			2	0
True Devon Evergreen Grass ...	Per bushel	5*s.* to	6	0
Imported Italian Rye-grass		6*s.* to	7	0
Dickenson's Improved do.			8	0
True Somerset Cow Grass ...	...Per lb.	9*d.*, 10*d.*, to	1	0
Alsike Hybrid Clover			2	0
Common Red Clover...		6*d.*, 7*d.* to	0	8
White Dutch do.		9*d.*, 10*d.*, to	1	0

Prices of all kinds of Agricultural Seeds will be found in RENDLE'S "Farming Price Current and Agricultural Directory," just published.—Apply to
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

RENDLE'S IMPROVED SWEDE TURNIP.—*This is the most hardy variety in cultivation, and has stood the late severe winter, in the most exposed situations, without the least injury. The Subscribers have received scores of letters during the past month to confirm this statement.*

It is handsome in form. Small tap roots, will keep longer than any other sort, and is altogether a most valuable variety.

It has been selected with much care for the last seven years, and the present stock has been saved by growers of the first respectability. Price 2s. per lb., or 1s. 9d. per lb. if taken by the cwt. Wholesale Dealers can be supplied with a few bushels.

For Description, Testimonials, and Engraving, see RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY."—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

AGRICULTURAL SEEDS,
MEADOW & PASTURE GRASSES, &C.

PETER LAWSON AND SON, of Edinburgh and London, the QUEEN'S SEEDSMEN, NURSERYMEN, and WOOD FORESTERS; and to the HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S. are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, MARCH 31, 1855.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY,	April 3—	Agricultural Imp. Soc. of Ireland.
WEDNESDAY,	— 4—	Agricultural Society of England.

THE discussion before the Society of Arts on TOWN SEWAGE has been one of the fullest and most interesting to which that question has been yet subjected. Mr. LAWES, by his long experience as a chemist, an agriculturist, and a manure manufacturer, was perfectly qualified to introduce it fairly in all its aspects; and amongst his audience were Professor WAY, who had made the chemical relations of the subject his especial study—Messrs. CHADWICK, WARD, BAZALGETTE, and HAYWOOD, who were competent to speak upon its sanitary and engineering relations—and such men as Messrs.

Caird, and Paine, and Scott, and Sidney, who were guarantees that the purely agricultural aspect of it was fully represented.

The main results of the debate may perhaps be given thus:—(1), that the conversion of sewage into a solid manure of value enough to pay for cost and carriage is impracticable; and (2), that the possibility of carrying it in a liquid form to such lands as are suitable for it is more than ever doubtful. Probably on the first point it would be fair to add that the decision of Professor Way, which was generally acquiesced in, related to *London* sewage. Elsewhere (unfortunately for the inhabitants of such places) it may be stronger than it is with us, and its concentration may be profitable: and Mr. Wicksteed's works not yet completed at Leicester—of which we shall give a report as soon as they are ready for inspection—have been erected in the confident belief that Mr. Way's decision does not apply in that locality. On the second point, too, it must be added that the doubtfulness of a profitable application of town sewage in the liquid form seems to depend on the improbability of finding suitable land on a lower level than the sewers. Professor Way's remark, that large towns are situated either in the neighbourhood of alluvial and adhesive soils does not universally apply; and wherever drained land of a porous character is obtainable below the level of and near a source of sewage, it may no doubt be profitably used. The very interesting experience of Mr. Paine on the possibility and economy of applying liquid manure during the winter months to arable land, in anticipation of summer crops, together with the researches of Professor Way on that power in soils on which their conservative character in this respect depends, are, of course, an encouragement to persevere in the attempt to utilise the contents of our sewers; and the practice on the Ayrshire farms, where the liquid is applied during the winter months upon the land for Turnips, and only in the spring and summer on the Italian Rye-grass, points the same way.

The agricultural discussion in connection with the subject, conducted chiefly by Messrs. Scott, Caird, and Paine, we have given pretty fully in our columns. Our own opinion is that the possibility of growing a "poisonous!" food by excessive manuring, if it has any truth at all, has been greatly exaggerated; and that to attribute pleuro-pneumonia to the use of Italian Rye-grass grown in this way is not "tying the two ends of a thing together" at all; it is placing together two entirely different things which have no *necessary* relationship to one another. The evils of those Edinburgh meadows, of which, we should think, every reader on this subject is heartily tired—the experience of cow-feeders there, and that of the Insurance Company which bears their risks—all these matters have no *necessary* relationship to the subject; they are obviously either exceptional or the result of mismanagement. There is hardly any more richly manured field, we dare say, in the island than Mr. Telfer's Italian Rye-grass plot near Ayr; but he can cut from off that field food as succulent or as dry as he chooses, and, we dare say it, he can ensure what health for his live stock he may please, not of course by attending merely to their food but by management in other respects.

We have seen cow-houses, containing from nearly 50 to upwards of 500 cows—one light and sweet and clean, another at the first sight seeming dark and foul as any "black hole" that was ever imagined. We entered the one as into an airy and pleasant apartment; on opening the door of the other a rat was disturbed, and slunk lazily away out of sight, just as if we had been looking in at the mouth of a sewer tunnel. In both of these byres the cattle are fed upon Italian Rye-grass—fed, too, upon Grass grown on liquid manure; what the experience as to balance-sheet of the two cow-keepers actually may be we do not know, but that there is a difference between the two, both as to healthiness of animals and wholesomeness of milk, we cannot doubt. This difference is notwithstanding a great sameness of food, for both are fed upon the "unwholesome" Italian Rye-grass—and it shows where we must lay the charge of pleuro-pneumonia death—not so much upon the food of the animals as upon their treatment in other respects.

We must add a word upon the opinion on manuring soils rather than plants, expressed by Mr. Paine as a practical agriculturist, in accordance with Mr. Way's opinion as a scientific man. His statement is that it is becoming more than ever the rule to manure the land rather than the crop. Now, we confess that we should have stated the case exactly the other way. Whether there is thus an advantage to the wholesomeness of vegetable growth (which, by the way, is almost entirely a new idea in agriculture) for hitherto vigorous growth and large produce have been held proof of healthy growth,—whether this wholesome growth is ensured by a digestion, so to speak, of the manure in the soil before it is sucked in by the plant—we do not now discuss, but we must state the belief that, comparing present practice with that of years ago, there is a *shorter* interval generally now between the application of manure and the attainment of its result in the crop than there used to be. The idea of a crop whose consumption shall restore the land—one manuring crop in a rotation by which fertility is maintained throughout it, so that the full result is not obtained till the 4th or 6th year, as the case may be—no longer has that hold it used to have. "The practice on this farm," said the *Times* commissioner of Mr. Hudson's land at Castle Acre, "is to manure for *every* crop." And that practice is gaining ground everywhere: witness the enormous bulk of artificial manure now in use, and the practice now becoming more general, of saving a portion of the farm-yard dung from the green crop "break" and applying it to the other crops in the rotation. Whatever use may be, has been, and no doubt will be made of Mr. Way's discoveries as to the conservative character of ordinary well tilled soils, we believe that, comparing 1855 with 1845 and previously, it is becoming *less* than ever the rule to manure the land rather than the crop. And how greatly to the advantage of the farmer this altered practice is, any one who can do a sum in compound interest and knows the difference between quick and slow returns on the profits of a business, easily can tell.

The subject in some other of its relations must be again referred to.

Among the earlier agricultural gatherings of importance this year will be that of the Royal Dublin Society on the 10th of next month, and the forthcoming exhibition between June 1st and 10th at Paris. The extent of the Dublin show may be gathered from the fact that there are 200 bulls entered for competition. The character of the Paris exhibition may be anticipated from the central position which the capital of France this year occupies from almost every point of view. The agricultural, no less than the commercial and social interests, are being cared for by the imperial commissioners in charge of the Great Exhibition of 1855. Agriculturists of all countries are invited to compete for the very liberal prizes offered for cattle, sheep, pigs, and poultry; and we hope those of the United Kingdom will respond liberally to the invitation. Many of the cattle shown at Dublin early in April will no doubt find their way to Paris towards the end of the following month. Their expenses from the place of landing to Paris will be repaid by the French Government, who charge themselves also with the cost of maintenance of the animals in Paris.

It appears that "the experience of some of the best Lothian farmers is against the growing of Italian Rye-grass, they having some years ago cultivated it in the place of the common Rye-grass, and as a mixture with it," and most of them having since abandoned it. This is a statement published by one agricultural paper and quoted by another in the leading page, with all the emphasis of capitals and italics. What if an agricultural journal should lift a warning voice against the use of guano—quote instances (which may no doubt be had for the search) in which the manure has failed—and, generally, shake the head and recommend the wisdom of a cautious course in reference to it! This would not be greater folly than the attempt to write down the cultivation of Italian Rye-grass. The single ton or so of guano which Mr. Scott told us at the Society of Arts last week that he, with Mr. Skirving, of Liverpool, was the first to use some 14 or 15 years ago, though at the price of nearly 30*l.* per ton, has grown to 129,839, 123,166, and 235,111 tons in the three last years; and this would, probably, be held conclusive of its usefulness in agriculture, notwithstanding the failures which have been recorded, whether owing to mismanagement or adulteration. And though "some of the best of the Lothian farmers" may have given up the use of Italian Rye-grass, the real value of that crop in general estimation is sufficiently proved by the importation of its seed, which in the hands of a single firm alone has reached the amount of nearly 40,000 bushels annually, by a steady growth from 160 bushels 24 years ago; and by the distribution of this seed, too, from the hands of all the retail dealers who have spoken on the subject, for it too has wonderfully increased in almost every part of the country.

Let those who think that agriculturists generally are given to speculative and extravagant enterprise act the drag as the greatest service they can do. We do not here desire to compare the relative merits of the spur and drag respectively as agricultural implements; but, in reference to a progress so constant and so safe—made, too, without the aid of any spur—and proved so unquestionably by the direct testimony of seedsmen, it does seem to be the height of absurdity to think that the interests of the farmer require him to be cautioned against the adoption or extension of it. We have no doubt that in spite of the exceptional failures—and the liability to false seed is just as fatal to the result as is the liability to adulterated manures—the growth of Italian Rye-grass will continue to extend just as the use of guano has extended; and a larger extent of the stubbles of the now young grain crops will this year be set apart for Italian Rye-grass than has ever hitherto been done. We venture to recommend agriculturists to act in this matter independently of the doubting tone which has been raised upon this point, and so echoed as that the warning portion of it is heard louder than the rest. We know that the growth of this crop has been, and we believe it will continue to be, extended largely, not only in mixtures with other Grasses and with Clover, but by itself, both under ordinary cultivation and as stimulated by irrigation.

TOWN SEWAGE AND ITALIAN RYE-GRASS.

The question of liquid manuring begins to assume a practical bearing, and the interest as well as the importance of the subject has been greatly promoted by the recent excellent papers of Mr. Lawes on the Sewage of London, and of Mr. J. C. Morton on the Italian Rye-grass. I am pleased to find that the conclusions respecting the value and the application of sewage which I arrived at several years ago, and which I endeavoured in vain to impress on a neighbouring town (since victimised by the apostles of the Board of Health) has been borne out and established by the elaborate and valuable calculations of Mr. Lawes. The subject is, therefore, one of peculiar interest to me, and I am desirous of directing attention to one or two points, whilst the papers to which I have referred are before the attention of readers. We may I think consider as settled points—

1. That if the sewage of towns is to be rendered profitable it must be by being applied in a liquid state.

2. That Italian Rye-grass is above all others the plant which offers the greatest return for the application of liquid manures.

3. That this plant should not be fed on the land, but cut for soiling, and removed, so as to allow the immediate supply of an abundant dressing of liquid manure.

4. That the liquid manure as applied by Messrs. Mechi, Kennedy and Telfer is of vastly superior quality to that furnished by ordinary sewage. On this last point I think it would be very desirable if the above gentlemen were to furnish samples of their manure, which should be compared by a chemist with that furnished by ordinary sewage. This observation leads us to notice a practical difficulty with regard to sewage which has not hitherto received the attention it deserves, viz., that when we require the most sewage we shall have the least, and when we need the least we shall be supplied with the most; when the land is saturated with moisture the sewage will be copious and diluted, and when the soil is parched by drought the sewage will be scanty and concentrated. To this we may add that the tendency of sanitary improvements is to render sewage more diluted and less valuable.

It is evident therefore that it will be at all times difficult to fix a pecuniary value per ton on sewage in the same manner as it would on Peruvian guano if it sometimes contained 17 per cent. of ammonia and sometimes only seven.

It will be necessary, in order to render it available, that a given number of acres should be devoted to the growth of Grasses for its reception, and that means should be afforded by which its quality should be doubled or trebled by artificial manure when required, and either diluted with water in the summer, or collected and retained in immense reservoirs against dry weather. Dismissing the subject of sewage, and reverting to that of the application of ordinary or artificial manure in a liquid state, I may venture to express my belief, that although the idea of laying down pipes for the purpose throughout the whole extent of a farm, and on many farms, is probably Utopian, and would by forcing into general use a particular mode of farming defeat the very end for which it would be introduced in the realisation of profit, yet that it is extremely probable that on a great number of farms where steam machinery is available, and a copious supply of water exists, a portion of the farm nearest the homestead might be furnished with pipes, and devoted by means of irrigation to the production of monster crops of Grasses. If, for instance, in a farm of 500 acres, 100 of those nearest the homestead were to be pierced with pipes, a moiety of 5 acres might always be kept in Italian Rye-grass or Clover, whilst large crops of grain, Pulse, or roots might be raised alternately without further manure. The resources of the farm would thus be vastly enhanced whilst the general management might not be greatly interfered with.

There appears to be much discrepancy with regard to the quantity of liquid to be applied at each dressing; Mr. Mechi applies 10,000 gallons; Mr. Telfer more than double, viz. 100 tons, or 22,400 gallons; whilst Mr. Lawes gives

down the enormous quantity of 10,000 tons per acre per annum, which gives 2000 for each of five applications. Now whilst we think the latter (if not a mistake) is greatly above the rate that can be profitably employed, the quantity applied by Mr. Mechi might be increased with much advantage. It was very evident to those who, like myself, had the pleasure of inspecting Mr. Mechi's operations in July last that whilst the Italian Rye-grass in the neighbourhood of the furrows was green and luxuriant that on the top of the ridge was very inferior. The former from their lower level must have received at least double the amount of liquid to that imbibed by the ridge; whilst the furrow might have had at the rate of 60 tons per acre, the ridge could only have had 15, which, supposing the land to be in a dry state, would not have penetrated one inch in depth. It appears, therefore, that as 1 inch, or 100 tons of liquid, would wet the land 4 inches in depth, that this quantity in dry weather would be by no means too much. We may, therefore, come to the conclusion that the quantity supplied at each dressing should approach 100 tons if the land is in a dry state. It is very evident that if the Grass crops are heavily dressed the intervening grain crops will require no further assistance, but will be sufficiently fed by the overplus supplied for the Grass. It has been urged by some parties that if no solid manure is used the land will become too close, and will miss the carbon which the straw supplies. This objection, however, may easily be met by leaving the stubble of the grain crop longer than usual and putting it in, or a portion of the last cutting of Italian Rye-grass might easily be buried, thereby supplying plenty of carbon if it is really required. There is one point of much interest which the production of monster Grass crops appears to elicit, which is the enormous quantity of silica readily extracted from the land by means of the Rye-grass; and although, no doubt, a good portion of silica is supplied in the liquid manure, yet it is only partially in a soluble state, and we can rapidly raise a monster crop with equal facility by applying sulphate of ammonia, or guano (containing very little silica), with a large quantity of water. If therefore the free application of ammonia to the soil will enable it to give up so large an amount of silica to plants, we need not be under any apprehension that sufficient silica will not be supplied to ordinary crops under ordinary treatment, and there is very little encouragement afforded for supplying silica, either soluble or insoluble, in artificial manures. *W. C. Spooner.*

Home Correspondence.

Measurement of Haystacks of a cylindrical form with conical roof.—In Strachan's agricultural tables (Simpkin and Marshall, 1843), the following rule is laid down, viz.: "To the perpendicular height from the ground to the eaves, add one-third of that from the eaves to the top for the mean height; then multiply the square of the girth by the mean height, their product multiplied by 100 and divided by 4847 will give the number of stones nearly, reckoning 7 stones to the cubic yard." Example. A rick of hay 18 feet from the ground to eaves, 9 feet from that to the top, and 60 feet girth gives 1559$\frac{4}{5}$ stones. Now, what I want to know is—firstly, Why does he multiply by 100 and divide by 4847? Secondly: Is 7 st. per cubic yard a pretty fair allowance for ordinary sized haystacks (say one of the above dimensions)? Lastly, is it true that there are 1559 st. in the above-mentioned stack? By the aid of mathematics I make out that the cone = 35 cubic yards, cylinder = 209 cubic yards; total, 244. I am aware that in the second question much would depend on the quality and state of the hay, yet I think that there must be some approximate weight fixed by valuers for a cubic yard of good meadow hay well got. *Mathematics.* [The solid contents of a cylindrical rick, assuming the conical top of it to fill a cylinder one-third its height from the eaves upwards, are obtained by multiplying the area on which it stands into the height thus obtained, *i.e.*, into a height equal to the height up to the eaves, *plus* one-third of the height above the eaves. But the area is the radius multiplied into one-half the girth, and as the diameter is the girth divided by 3.14159, it follows that the area is represented by the square of the girth divided by about 12.566. If, therefore, the solid content in cubic feet be obtained by multiplying the height into the square of the girth (both in feet), and dividing by 12.566, it follows that by multiplying this by the number of stones of hay in a cubic foot you obtain the weight of the rick. According to Mr. Strachan there are 7 stones in a cubic yard, or $\frac{7}{27}$ in a cubic foot; and you will find that to divide by 12.566, and then multiply by the fraction $\frac{7}{27}$, is just the same as multiplying by 100 and dividing by 4847, which is Mr. Strachan's rule. Hay varies from 8 to 12 cubic yards per ton, according to the age and size of the rick, and therefore no rigid rule is applicable.]

The Laughing Pigeons.—In answer to inquiries, I mention that a friend purchased these birds for me at Mr. Steven's, in King Street. My friend understood, when he bought them, that they had come from Persia, *viâ* Bombay. If I can obtain any further particulars I will send it to you. *An Old Subscriber.*

Cross Breeding v. *Breeding in-and-in.*—I had fully intended to leave Mr. W. P. Ayres to the quiet enjoyment of his theory, however erroneous I may and do consider it, on the subject of breeding; but, as my silence might be misconstrued into an approval of a system—if system it may by courtesy be called—the leading feature of which is alteration of form under the guise of improvement of animals, I think it but due to the public and to myself to reiterate my firm but earnest protest against the opinions he has endeavoured to promulgate, and which, if generally adopted, would infallibly lead to very serious and mischievous results. I endeavoured to prove this, and to my own satisfaction, and that of many of far greater experience than I can boast, did prove it, from the written testimony of one of our ablest and most scientific authorities in such matters, the late Henry Cline; and, yet more important, the living evidence of Messrs. Brown's flock at Denver. To all this, what counter evidence has Mr. Ayres to offer? A successful blunder of his Welsh friend to enlarge the form of his native mountain sheep, by means repugnant alike to the principles of science and nature. I speak advisedly. It is a blunder, and not the less so, because in this instance it happened to succeed. It is beginning at the wrong end; and most assuredly, if generally adopted, would lead to a vast amount of mischief and disappointment—I mean, of course, the introduction of males whose chief recommendation is their size and weight. By these so-called improvers, the old maxim of "small in size and great in value" seems either disregarded or in some danger of being altogether reversed. Shade of Bakewell! forgive this outrage on the principles so wisely and assiduously inculcated by thee; and in all kindness compassionate the errors both of omission and commission of many who in their own imagination are theoretically treading in thy footsteps, when, literally and truly, they are but following an *ignis fatuus* of their own invention! As to the in-and-in system, so long and so successfully adopted by the Messrs. Brown—"a great fact," as I may call it, of more than half a century—what has Mr. Ayres to oppose? Not a syllable as to sheep breeding at all, but a most touching and doleful tale of a certain dairy of cows being so bred that they had no milk; and so fat, you could not keep it down, even in a strawyard! And this Jeremiad is put forth, I suppose, as a caution to my unhappy friends (Joseph and Thomas Brown) to avoid the rock on which this unfortunate cowman (laid down in Mr. Ayres's chart as "the in-and-in shoals") appears to have split. With all deference, I suspect that my excellent friends, however much they may appreciate Mr. Ayres's kindness in this his friendly warning, will be very apt, with me, to assign a far different reason for the cowman's failure, viz., ignorance and mismanagement. These are strong words, I admit; but obstinate diseases require strong remedies, and this is of them. I have mentioned Messrs. Brown as skilful and successful breeders on the in-and-in system; but I am able to point to a similar instance in the immediate neighbourhood of Mr. Ayres, in the person of Mr. Valentine Barford, of Foscote, near Towcester, and but a short distance from Whittlebury. This gentleman will, I am quite sure, not only confirm all I have said as to the Denver sheep, but is able to exhibit in his own flock a further instance of what may be done by a long course of judicious management in the breeding and selection of individuals on the in-and-in principle. I have no authority from Mr. Barford thus to bring forward his name; but knowing, as I do, the pleasure it always gives him to aid the cause of real improvement, I have the less scruple in taking the liberty with him. If I am wrong in so doing, my motive must be my excuse. *T., Gloucester, March* 23.

The Lambing Season.—Having lost several ewes during the lambing season, I shall feel obliged by your inserting these few lines in the *Agricultural Gazette*, trusting that some of its numerous readers may be enabled to render me a little assistance. My flock consists of 500 ewes of the Dorset breed; they commenced lambing about the middle of December, and with the exception of a few which were very late, had dropped their lambs by the end of the first week in January; consequently my ill-luck cannot be ascribed to the severe weather, as about that time it was both dry and mild. About two days after lambing the disease first appears; the ewe does not feed, inflammation of the uterus is, I suppose, going on; within a few hours she commences heaving, after which I have not known a single instance of recovery. I must add that this disease attacks the "two-teeth" sheep only. I have tried laudanum, Epsom salts, and ginger, but always unsuccessfully. Can any remedy be given? and what is the reason that the older sheep do not suffer? Whilst mentioning Dorset sheep, I will draw your attention to what appear to me to be errors in "Blackie's Cyclopædia." I think the fleeces will be found to average 5 lbs. per fleece, and three-year-old fat wethers will average a great deal more than 18 lbs. per qr. *C. P.—W. P.* [*Heaving and Inflammation.*—This somewhat mysterious and peculiarly fatal disease has been very prevalent this year, and appears to bid defiance to remedial measures. A friend of the writer, who has suffered much from it this, as well as in former seasons, has found that of two flocks, one that had had Swedes were affected, and another that had received common Turnips escaped. He ascribes it to the stimulating properties of the Swedes, and intends for the future to give no Swedes before lambing. High keep, and a want of sufficient exercise before lambing, are no doubt predisposing causes. It usually attacks ewes with the second and third lamb, but your case appears to be an exception. Perhaps your young ewes may be in better condition. *W. C. S.*]

Agricultural Statistics of Scotland.—I have no doubt a great many in England look with great interest at the statistical returns of Scotland collected by the Highland Society, and we shall no doubt see them taken for what they are not—a true return of the produce of Scotland. It must be remembered that farms rented under 20*l.* in the Highlands, and 10*l.* in the Lowlands, are excluded altogether. (I do not see why 20*l.* should be fixed upon in one division of the country and 10*l.* in another.) This, it is obvious, confuses the whole affair; and, as we have no means of ascertaining the proportion the excluded portion bears to the whole, the deficiency cannot in any way be calculated; indeed it varies immensely in my own neighbourhood. In the Highlands I am inclined to think one-third of the arable land is not returned; these small farmers, although nominally going by the five-course rotation, grow a much larger proportion of Oats, sowing it both in the place of Barley and as a second crop, but scarcely any Wheat, so by excluding them the proportion of the various crops returned varies from the truth. If the returns are continued year after year on exactly the same plan they will prove useful, as showing to some extent the progress of agriculture; but they can in no way show the produce of the country either in amount or the proportion of the different crops. *A. C.*

Italian Rye-grass.—The favourable account of the growth of Italian Rye-grass that has lately appeared in the *Gazette* will be the means of doing much good. The incontrovertible and well-defined facts therein stated should be a sufficient inducement to many to enter on its culture, "at least in an experimental point of view." Though I do not happen personally to have an experience in its separate culture, yet I have always advocated the introduction of a certain portion of Italian Rye-grass in addition to the other Clover seeds in the ordinary course of cropping, and have derived great benefit from the practice in "early spring" by having good pasture to turn ewes and lambs on to at least a week or 10 days in advance of some of the neighbouring farmers—a circumstance of some importance in a sheep-breeding district such as this happens to be; nor was the appearance of a good bite of green food at this season of the year lost sight of. As I have the pleasure of knowing many intelligent farmers who, within the last few years, have had recourse to the same alternative, and with the like good result, I have seen some enormous crops of Italian Rye-grass grown "north of the Tweed," and have often wondered why its culture had not become more extended; but from the able advocacy its merits are now receiving, I have no doubt that ere long patches of Italian Rye-grass may be seen flourishing on every farm with as much luxuriance as it has hitherto shown on the Ayrshire farms. *P. Deane.*

Hardiness of Mangold Wurzel.—Last year about the beginning of May I drilled a few acres of yellow Globe Mangold Wurzel, 27 inches apart, with seed from Messrs. Sutton, Reading; they were hoed and set out in the usual way, not moulded up to keep them from the frost. About the latter end of October I began to stack them. Having had some conversation with a first-rate agriculturist on the hardiness of the root, by way of experiment I determined on leaving a few. I therefore selected two rows, about 200 plants, in the middle of a 40 acre field, where they have been during this severe winter. On examining them this day there is scarcely a rotten one; I fancy they are as good as they were last autumn. If any of your readers would like to inspect them they are at liberty to do so by applying to me. *W. Davis Briginshaw, Amerden Farm, Taplow, Maidenhead, March* 23.

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

WEEKLY COUNCIL, *March* 28.—Mr. MILES, M.P. president, in the chair.

FRENCH AGRICULTURAL SHOW.—M. Herbet, the Consul-General of France in London, transmitted to the Council, on the part of the Minister of Agriculture and Commerce in Paris, an announcement of the Agricultural Show to be held in that city at the beginning of June next, and a schedule of the prizes and the conditions of competition in reference to foreign exhibitors. The following is a summary of the prizes offered in the first section, which includes cattle of foreign (that is, not French) breeds, imported into France for the purpose of the show, and having either French or foreign owners:—

Improved short-horned cattle	£187
Other English breeds	233
Dutch, Swiss, and other breeds	233
Merino, pure and crossed	116
Dishley, New Leicester, and other long-woolled sheep	116
South-Down, and other short-woolled sheep	116
Pigs, of large breed	47
Pigs, of small breed	53

The birth of all male animals in the classes of cattle and sheep must have occurred before the 1st of May, 1854; and that of females in those classes before the 1st of November, 1853. That of boars and sows must have occurred before the 1st of October, 1854. All animals condemned by the jury as being too fat will be excluded. The first prizes for cattle, sheep, and pigs will be accompanied in each case by a gold medal; the second prizes by a silver medal; and the other prizes by a bronze medal. The show will last from the 1st to the 9th of June, during which period the French authorities will take charge of the animals and supply them with food. The French Government will pay the expenses from the frontiers to Paris, attending the conveyance of all stock sent from foreign countries. The reception of animals for the show will close at 2 P.M. on June 1st. The public exhibition will take place on the 5th and 6th of June. The entry of animals for the show will close on May 24.

The appointment of a deputation from the Society to the Agricultural Meeting of France was then suggested, and referred to the ensuing Monthly Council.

LABOURERS' COTTAGES.—Miss Banister, of Steyning,

transmitted to the Society several models of cottages for labourers, with statements referring to their construction and peculiar advantages, for which the thanks of the Council were ordered. Mr. Slaney, at the request of the President, undertook to inspect these models, and to report upon them to the Council.

Production of Butter.—Prof. Way read to the Council a letter addressed to him by Mr. Horsfall, of Burley Hall, near Otley, on the amount of cream and butter he obtained in his dairy by the particular management of his cows. This communication led to the expression of much diversity of opinion on the conditions under which the production and quality of milk is affected. Mr. Horsfall was requested to supply details of his management; and, on the motion of Mr. Caird, the further discussion of the subject was deferred until the second Wednesday in May.

Lecture.—Prof. Way's lecture on the Atmospheric Influence in Reference to Vegetation was arranged to be delivered on the 25th instead of the 18th of April.

Society of Arts, *March* 19.—*Sewage of London.*—[We add to our last week's report an abridgment of the addresses on the subject by Mr. Scott, of Liverpool, and Mr. Paine, of Farnham. Mr. T. Scott said—

The value of sewage had been carefully ascertained by Prof. Way, and amply illustrated by Mr. Lawes, and the result appeared to show that five-sixths of it was held in solution, and one-sixth in suspension. This also was the case of the Edinburgh sewage water, according to Professor Anderson's analysis, which, however, must be noted as much richer in the elements of fertility; and this analysis confirmed the results of Professor Way and Mr. Lawes's investigations, if any confirmation were required. Now as there was no absolute fixer of ammonia and of the other valuable elements thus held in solution, enabling us to secure the above five-sixths of volatile matter in a solid or sedimentary state, and then let the pure water go free, a pretty general unanimity of opinion was becoming prevalent in favour of appropriating the whole sewage of London to irrigation. No one, however, had as yet ventured even to shadow forth a plan on which this theory was to be carried out in practice, and it, therefore, appeared premature to launch so much recrimination as had been done against those the business of whose lives was remunerative farming for not accepting that which had never yet been put within their reach. As a practical agriculturist, farming land mainly for profit, he differed with Mr. Lawes and with a similar sentiment contained in a letter he held in his hand from Mr. Telfer, of Ayr, as to the propriety of forcing crops up to a point at which they become injured, but he was quite willing to use manure up to the highest point at which it was profitable. He at the same time was ready to admit, and had good data for believing, that 10 times the present expenditure of manure could be profitably employed if it could be obtained in any shape at the standard price of pure superphosphate of lime, or guano. Mr. Mechi said that sewage manure could be profitably applied to cereal crops: we had no precedent, however, for such a doubtful practice except on a very limited area of light soils in this country, or in the rice swamps of Italy, India, and America; in fact, the great desideratum in connexion with cereal crops here was how to stiffen and support the straw, not how to turn it into a weak aquatic reed. Just ask any farmer—he would not even stipulate for an intelligent farmer but one possessed of only the ordinary instinct of his kind—if he would like to have the fall of rain over his Wheat fields throughout the year doubled or quadrupled, and you would have a sound solution of the problem as to applying liquid manure to Wheat crops generally. Few of us would like to miss Mr. Mechi's presence from these meetings, and from Tiptree farm at his annual gatherings, but if he persisted in the practice of applying liquid manure to grain crops, his legitimate field of operations was not Essex, with its 130 rainy days in the year, but Italy, with its 38 (see Capt. Baird Smith on Italian Irrigating), or even the arid sands of Sahara. In these countries it was a question of irrigation and a crop, or, no irrigation and no crop. This, however, was seldom the case with us in this country, and it, therefore, appeared to him superfluous to adduce the case of Italy, and other countries, with their comparatively rainless climates and arid soils, and where no parallel circumstances existed. The nature and appropriation of the soil, too, was so entirely dissimilar that he thought he should do best to confine his remarks to what existed or was proposed to be carried out at home in connection with sewage irrigation. The lowest estimate of the quantity of land required for the London sewage was made by Mr. Lawes, and amounted to 20,000 acres. He at the same time confirmed the all but universal opinion that Grass, either natural or artificial, was the only crop to which liquid manure could be profitably applied. Now, although London was surrounded by Grass lands, he could not see that this 20,000 acres could practically be obtained out of a less area than 40,000 acres, or upwards of 60 square miles of land—being a larger area than that on which London stands (and here within parenthesis he would say that the Italian irrigation was nearly always applied to land under alternate husbandry). The first question that occurred was how this immense tract of land for irrigation was to be obtained: were the owners and occupiers voluntarily to combine to take the sewage, or were they to be compelled under an act of parliament? He confessed this staggered him. Again, if the sewage at the rate of 10,000 tons per acre, as proposed by Mr. Lawes, was thus concentrated on a single district, would not the nuisance created be greater than that now existing in the Thames? Surely, if we were to pay for its removal, we were not to have an equivalent elsewhere. Why residential property for miles around would be depreciated in lettable and fee simple value, and its owners would indite the nuisance, as would all passers by, whether by road or rail, and who would answer for the consequences? Who would justify the scheme to the general public, who have no interest in getting cheap bad milk near town, when they could by rail get better from a distance. It would be seen, by a letter he should presently read, that two eminent men, Dr. Sutherland and Professor Simpson, of Edinburgh, had reported against the fœtid irrigation of one of the newest water meadows near that city, and that medical men had condemned the milk. If, on the contrary, it was attempted to apportion out the sewage of London in driblets over a wider expanse of country, Mr. Lawes had shown that it would not pay, and the chairman had confirmed his calculations. When Mr. Chadwick said that it could be delivered at a distance of 10 or 15 miles from London, and 150 feet above the level of the discharging sewers, at 2½*d.* per ton, he surely never meant that it was to be spread over the land—which was the principal item of cost—at that rate; if so, many individual occupiers of light land could apply the sewage with advantage, but not even then at the rate of 10,000 tons an acre, as suggested by Mr. Lawes, which would cost 104*l.* 3*s.* 4*d.* an acre. It could be used more sparingly, however, and no doubt with a profit to many crops. He had been in the habit, for 5 or 6 years, of sowing upwards of 100 acres of Turnips annually with Chandler's liquid manure drill, using about three tons of water or 672 gallons per acre, with signal success; but he never could get it distributed at less than about 6*s.* per acre, nor did he expect to do so even, though this was nearly ten times Mr. Chadwick's price. He agreed with Messrs. Chadwick and others that Mr. Wicksteed's estimates of cost for trunk drains and pipes for irrigation were extreme—as also his estimate of land required, and which might, to some extent, be accounted for by his being an advocate for solidifying the sewage ingredients. He had, therefore taken the figures of those who preferred irrigation. Mr. Lawes valued the ingredients in the sewage of London at 774,525*l.*, and Mr. F. O. Ward calculated the water with which they were carried off at 90 millions of tons. Now, if all this sewage was to spread over 20,000 acres of land, we should have 100 inches deep over 60 square miles. Imagine such a putrid sea within sight of the largest and most condensed mass of human beings in Europe, and then say, if such a thing was likely to be tolerated. Edinburgh, with its 600 acres, was bad enough in sultry weather, as he had personally experienced; but what was it to this! Then take the case of Edinburgh as to the effect on the animals fed on sewage Grass. The author of the admirable prize essay on the farming of the Lothians lately published in the "Journal of the Royal Agricultural Society" wrote him:—"Since *pleuro-pneumonia* became so prevalent, the loss from this disease in the Edinburgh dairies exceeds all belief. During the first year or two, the veterinary surgeon was called in; but as cures were seldom effected, the butcher has taken his place. The loss has been so great that many cow-keepers have been ruined. It is rather suspicious and against the system of feeding with irrigated Grass, that Mr. Telfer, at Cunning Park, has been losing an immense number of cows, and the ventilation of his cow-houses cannot be surpassed, and cleanliness is most scrupulously observed. It is quite understood here" (Edinburgh), "that the experiment at Myremill has been anything but profitable; and Mr. Huxtable has, we believe, partly relinquished the practice. (Authority, Lavergne, the French agriculturist.)" Then as to the special case of Mr. Telfer, a gentleman wrote:—"So great a nuisance is Cunning Park that we have felt the most offensive smells near 'Alloway Kirk,' distant a mile and a half. We advised Mrs. Begg, Burns' sister, to indite him for a nuisance. This she declined doing; but we believe that other parties have been threatening a process of this kind." Another correspondent in Edinburgh, on whom he could rely, said:—"The meadows being very near the town (Edinburgh), and being irrigated so frequently as to produce three or four crops of very rank grass in the course of the season, were considered a very great nuisance by the inhabitants in this neighbourhood, and it was considered a great benefit to the city, generally, when the improvements connected with the Queen's drive, &c., led to the practice of so irrigating those nearest town being done away with. In hot weather, and in certain winds, the smell from these fields was intolerable, and the grass had the thick, rank appearance of the grass of a crowded churchyard. The smell, and their insalubrity, affected the rents of the houses exposed to their influence. As to the effects of grass produced by them on the milk or meat of cattle fed with it, I can only say that the general impression on the part of the public was very much against such milk and meat."

[Further evidence from the Agricultural Manure Company and from other witnesses, was adduced on the point by Mr. Scott.]

He had one letter from a large rent-paying occupier on the Duke of Argyll's estate in the west, and with which he was familiar, having resided as his grace's agent upon it, and he stated that irrigation and horse-feeding were supposed to destroy the procreative powers of cattle; and added, "The irrigation works in Ayrshire are looked upon by practical farmers and good judges with great suspicion, *i. e.*, Messrs. Kennedy's and Telfer's. Mr. Ralston's is upon the gravitation principle, and is most admired, and considered the most profitable. Indeed, the others are considered to be the reverse, even though Mr. Telfer sells his milk at 6*d.* per Scotch pint; but no one can say without seeing the honest balance-sheet." In justice, however, to Mr. Telfer, whose extensive and exact knowledge of the sciences of chemistry and physiology, and love of their pursuit, had, he had little doubt, been the main instigation to him to undertake his wonderful operations to illustrate "agricultural possibilities," at Cunning Park, and with the purest motives to instruct and not mislead—in justice to him he (Mr. Scott) should read part of a letter to himself, dated the 14th inst. That gentleman said, "I have hurriedly read Mr. Lawes' paper, delivered at the Society of Arts, and agree with him in what he says about the advantage of manuring up to the point at which the plant is injured in its growth. It is better to put a large quantity of manure on a small area than a limited supply on a more extended surface, or, if you choose, better to waste manure than land. I have been acting in this view in the growth of Italian Rye-grass, and with most satisfactory results. I believe I could put the whole liquid of my 48 cows in one acre of Italian Rye-grass, not only without doing injury to the plant, but with a decidedly more profitable return than if applied to a larger area." It must not, however, from this be supposed that Mr. Telfer would be able to feed his 48 cows off the acre so manured, for he saw by a report of the Board of Health that he had always been under the necessity of purchasing not only foreign cake, but home-grown corn and hay to sustain his cattle under his present system. But even if this irrigating system were found to be desirable and remunerative, the cost of carrying it out generally would absorb more than all the surplus capital of the kingdom. Take the case of the Duke of Portland, and who can imitate it by sinking 39,000*l.* on 300 acres. But this proof was entirely wanting up to the present time, and we had as yet no pecuniary inducement, and certainly no sanitary one, to adopt the system, and after banishing the ague by drainage, to bring it back by pestilential irrigation! How to render town sewage available to agriculture remained one of the most urgent, but he feared involved, economical problems of the day, and the offer of 1000*l.* for its solution, by Mr. S. Brooks, of Manchester, remained unclaimed. But the discoveries that science had made during the last few years left no man at liberty to dogmatise of the future. In the meantime, he would venture to suggest that a Commission of two first class practical agriculturists, aided by a competent chemist and a hydraulic engineer, might be sent to examine the sewage of continental towns—see how it was disposed of, if used, and to ascertain the results. Until something of this kind be done, we must, he thought, be content to obtain for agriculture from our cities only such solid matter as blood, and, in many cases, night soil, as we could intercept from the sewers, and which the Sanitary and Sewerage Commissioners might much facilitate; and, afterwards, we might intercept the sediment by an inexpensive process, which he purposed recommending to the notice of the Commissioners. Our present information leads to the conclusion: 1st. That precipitation produced an inferior manure, and would not pay for preparing; 2nd. That open-drain, foul-water irrigation would not be tolerated; 3rd. That pipe irrigation was unsuitable for either low or elevated clay soils, was doubtfully remunerative on any, impracticable on a large scale and would create an indictable nuisance; 4th. Intercepted solids and settled sediment inexpensively obtained seemed, then, the only residue we could secure out of this mine of liquid wealth. It was a scientific mistake to suppose that this water, or any kind of manure containing by analysis the elements of fertility required, was, *per se*, adapted to all soils; for in many cases we required to alter the mechanical texture of the soil by bulk—hence sewage as rich as that of Edinburgh might injure a clay soil, whilst the poorest solid manure might produce a beneficial effect. In the stewartry of Kirkcudbright he had seen land where, after the stones had been gathered off the land, it became unmanageable and unproductive, and these had to be restored to their original bed. And in Kent he had seen land, on Sir Percival Dyke's estate, where flints were obliged to be brought back, for the same reasons, after having been sold for road metal. So, after all, the bulk of Mr. Wicksteed's precipitated manure might constitute its chief value, and thus practically qualify the theory of the analytical chemists. A few experiments would shortly prove this, and it was to be regretted that we had no national experimental farm where such experiments could be made, and reliable results obtained.

[The following are remarks by Mr. Paine, of Farnham: we regret we are unable to give the contributions of other speakers to this most interesting discussion.]

To the conclusions of Mr. Lawes, that we must measure the value of manures by their chemical ingredients, he gave his most hearty assent; and he thought that the enunciation of the maxim that we should chiefly estimate the worth of manures by reference to the proportions of nitrogen and phosphoric acid they might contain, had been of immense service to all those farmers who had availed themselves of that information. Mr. Scott had just now alluded to the rank luxuriance of the Edinburgh meadows, as an evidence of extravagant liquid manuring, and had attributed the disease so prevalent amongst the cattle fed on those meadows to the bad quality of their food; while Mr. Caird altogether dissented from this view on the ground that his own cattle, receiving a different kind of food, were quite as severely visited by the epidemic. But whether the rank quality of the Grass in the Edinburgh meadows predisposed the cattle fed thereon to the taking of this particular disease or not, still he felt satisfied that even Grass lands might be over-manured by too large doses of sewage, so as not to allow it time to form those chemical combinations with the soil which Professor Way had spoken of, and which he had good reason to believe always took place in the land before the manure could be healthily assimilated by the plant, the manure being as it were digested by the soil, and thus fitted for vegetable use; and if so, it was highly probable that excessive manuring would produce a growth of crude vegetation of a poisonous rather than a nutritive character. But, returning to the uses of the London sewage, it had been generally admitted during this discussion that the several processes for converting it into a dry manure were failures, on account of the low chemical value of their results. To the liquid form of application our attention was chiefly directed, but from the many practical difficulties which had been started, he was not very hopeful of a speedy realisation of the advantages which the theory of the subject would lead us to expect. In the onset of any such undertaking, it seemed pretty clear that unless the City of London, for its own sanitary purposes, lent a strong helping hand to the agriculturist, there was not much prospect of so large a scheme being attempted; there must be, in fact, a combination of both interests. Now, as to the theoretical value of this London sewage, we learned from Mr. Lawes' Tables that each individual in the course of the year supplied about 8 lbs. of nitrogen and 4½ lbs. of phosphates, which substances would, if available, be worth at least 4*s.* and 3*d.* respectively; and, taking the population at 2,500,000, we had a money representation of 531,250*l.* per annum. This was supposing there was no loss of nitrogen in respiration, but this loss would be more than compensated by other refuse matters which flowed into the sewers along with human excreta. Then, again, 80 lbs. of nitrogen in the sewage, combined with the accompanying phosphates and alkalies, would be a most liberal manuring per acre for any description of crop; 10 persons produced this quantity, consequently 250,000 acres ought to be manured. Such capabilities of manuring, and so large a money value, ought not, and we might be allowed to hope would not, be eventually lost. The chemist and the agriculturist recognised the value of this sewage, but they must look to the civil engineer for the means of application. Mr. Way told us, in the early part of the evening, that we were not to expect much advantage from the application of sewage to the low-lying alluvial lands near the Thames, as they could not be properly drained for this purpose; and he (Mr. Way) differed from the opinion of Mr. Lawes, and many others, in thinking that it might be advantageously used for cereal crops; and he stated that he had arrived at this conclusion from the facts which he had discovered in his investigation of the absorbent properties of soils, and, therefore, especially recommended the use of sewage prior to the crops being sown. He (Mr. Paine) would be able to adduce a few facts presently, illustrative and confirmatory of Mr. Way's views, which, he considered, had a most important bearing upon the useful application of liquid manure. He fully believed that the metropolitan sewage might be beneficially used as a manure to every crop, provided due regard were paid to the time and mode of distribution, and provided always that the land were, either naturally or artificially, drained, so as to ensure a porous subsoil manure. For his own part he would fearlessly place the sewage upon the soil destined for root crops at any convenient time, before as well as after the plants came up. And here he could not but refer to Mr. Caird's valuable remark, that if sewage, or even water alone, could be obtained when wanted, at the prices stated by some of the speakers, it would prove a great boon in certain dry seasons in saving the crop of upland hay, and in starting the young root plants. Mr. Paine would now detail a few facts which had recently occurred on his own farm, which would tend to prove the soundness of Mr. Way's opinions relative to the possibility of successfully using liquid manure for corn crops, if placed upon the land at the proper time. 1. A field on a gravelly soil, resting upon chalk, was manured, in September 1853, with about 8000 gallons of liquid per acre, from the farmyard tank. It was sown in the beginning of November, with Payne's "Defiance Wheat," the same sort that the Rev. Mr. Smith, of Lois Weedon, sowed in his experimental crop of last year. It was a rather coarse variety. The rick being the produce of this field was threshed out in the autumn, the crop was 64½ bushels per acre, and was sold for 18*l.* per load of 40 bushels. The crop of straw was fully 3 tons per acre. 2. Part of another large field of a similar geological character had been in Italian Rye-grass for three years previous to the spring of 1853, and during this period it had occasionally been liberally dressed with strong tank manure. It was sown, late in the spring of 1853, with Wheat, and the whole field was much blighted. Last year, 1854, the field was sown with Oats, and the part which had previously been manured with the liquid grew the strongest crop of Oats he ever saw. The crop of the whole field was a good one; indeed, the average growth of Oats on his farm was upwards of 13 quarters, but this portion of about 3 acres greatly surpassed any other. The straw stood fully 6 feet high. 3. Another instance was on Hops, in a field adjoining another farmyard, in which there were spots where the chalk subsoil was faulty near the surface, and which were naturally less fertile than the rest of the field. Upon these spots in the winter time, when of course there was no growth in the plant, the liquid from the manure tank was pumped. This happened during two successive winters, and the result was the bringing of these poorer spots of land to the average fertility of the whole garden. He, Mr. Paine, regarded these "facts from the fields" as highly confirmatory of his friend Professor Way's researches in the laboratory, and he could confidently recommend them to the attention of his brother farmers, and he hoped they might tend to lead others to make similar experiments, as it was manifest that the safe application of liquid manure to the cereal crops had a most important bearing on the sewage question. He would only add another word in conclusion. Some of his friends who had visited his farm might ask him why he had partially discontinued the use of liquid manure. His answer was, that with the aid of Mr. Way he had discovered an inexhaustible supply of soluble silica on his estate. It was a porous rock, similar in many respects, to charcoal, especially in its deodorising and absorbent characters. He, therefore, now ground this rock into powder, and the liquid manure from the tanks was absorbed by it. This enabled him to give all his root crops a moist seed bed of highly stimulating properties. It might seem curious that he thus fell back upon manures obtained by absorption, the making of which from sewage he deprecated at the commencement of his remarks. But, then, let it be remembered, that the manufactory was on the farm, and, therefore, the cost of carriage constituted a very trifling expense.

Miscellaneous.

Guano.—A Return "of all the Guano imported into the United Kingdom in each of the years from 1852 to 1854, inclusive; distinguishing the quantities imported from each Country respectively."

Calendar of Operations.

MARCH.

West Sussex, *March* 26.—We have now got near to the end of March, when we usually have the fields assuming their cheerful green, but this year every kind of vegetation is very backward; and we find our Turnips disappearing rapidly and nothing coming to supply their place. The weather for the past few days has been very cold, and the frost at night sharp, and Grass has hardly begun to change its dull wintry aspect, so that if a change of milder weather does not soon come we shall hardly know which way to turn. We must now put the sheep upon a limited allowance of Swedes, and make up with cake or other artificial food with hay, and for the latter the consumption is unusually great for this time of the year, for generally before this time they give up eating hay. On all sides we hear that the Swedes are rotting, in some cases more than half the crop; and we shall now have an opportunity of testing the merits of those sorts that are said to stand any winter; for any that stand such a winter as we have had may be depended upon for any ordinary season. But there are other circumstances to take into account. We find that the same sorts have stood well on some land, and given way on others; and generally, where the land was free of stones, they have stood best: perhaps the stones may have damaged them when compressed by the frost, while in the soft land they have not been bruised so much. But, on the whole, we do not think that roots have been healthy at all; for all stock has done badly upon them from first to last. Tares and Rye have stood well, but do not come on fast; and the young Clovers are extremely weak, and make us doubt whether to leave them, or plough them up, to sow something else; but Tritolium looks well, and even one fine day would change it much. Wheat got very much cut up, but is now recovering, and may be pronounced in a fair way. The lambing season has passed over favourably, and young lambs are now coming into the market, but they are mostly of the Leicester or horned breeds; there have not yet been any pure Downs shown Barley sowing is hardly begun; and many are sowing Oats, though we consider it somewhat late for that crop. There is yet nothing done in preparing for the Turnip crop, but we are never allowed to forget that the time for that is coming; for the applications from the farmers' friends—I mean the manure sellers—are becoming numerous, and there is no difficulty in meeting with that respectable man or his agent with whom, in all treatises on manure, we are advised to deal exclusively. Who is not respectable? Of course all are if we take their word for it, and we must do so until we prove it otherwise, for that is the principle of English law. But then the proof is established with costs; and is it not the most ridiculous thing in existence to see a good old farmer listening to the plausible arguments of some clever-tongued agent for some celebrated nostrum? Surely, respectable men will bestir themselves and enlighten their own judgment so that it will act as their guide, instead of being led by the nose, and fleeced by well-known "respectables," as they have been. *G. S.*

Notices to Correspondents.

Agricultural Statistics: We have received a valuable paper on this subject from Mr. Lack, of the statistical department of the Board of Trade, which we are unfortunately obliged to postpone for a week.

Books: *O.* We do not know a work specifically on the law of leases. Bayldon on "Rents and Tillages" refers, we think, to the subject: and Low on "Landed Property" has a useful chapter on that topic.

Churn: *Constant Subscriber.* The churn made, we think, by Robinson, of Lisburn, in which the milk is treated pretty much as rags in the paper mill, travelling round and round in an elliptical tub, divided longitudinally into two divisions, in one of which the agitator is placed, while in the other any vessel may be put filled with water of the requisite temperature.

Cowpoxy: *Omega.* Pull the flowers before they seed, and cut up the plant, lifting as much of the root as possible, whenever the leaves appear. "Patience and perseverance overcome all difficulties."

Cream: *J. A. Gill.* You can easily sell any quantity. Cream of ordinary thickness can be bought wholesale in London, so we are told, for 2*s.* a quart; but of course it varies in price according to thickness. Milk sells wholesale for about 1*s.* 10*d.* per barn gallon of 17 pints. Cream would not stand a long railway journey, we fear.

"Economic" Manure: *A Subscriber from* 1841. The character of this manure was fully described in last year's volume. We do not advise you to buy it!

Grey Peas: *S. Cotton.* You have no doubt already answered the question for yourself. The crop has either already shown that it has recovered or the plants are plainly dead.

Guano to Oats: *A C.* Apply it mixed with mould at any time, and harrow it in. If spread broadcast without mixture, you had better wait till the seed has well brairded, and harrow it in after a shower of rain.

Lucerne: *Inquirer.* 12 inches intervals are enough.

Weight of Italian Rye-Grass Seed: *Messrs. Drummond, of Stirling,* write to us that their mention of 28 lbs. as the weight of a bushel of Rye-Grass referred to the common perennial kind; the greatest weight they have known of Italian Rye-grass was 22 lbs. per bushel, and the ordinary weight of that seed in their experience has been from 14 lbs. to 16 lbs. per bushel.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.

Canonmills Bridge, Edinburgh.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, William Dray & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1 12 0
2½ „	long 3 „ 3 „	gutta percha,	1 15 0
3 „	ditto 3 „ 6 „	or cast iron	2 12 0
3½ „	ditto 3 „ 6 „	flanged pipe,	2 18 0
4 „	ditto 3 „ 6 „	as required.	3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto ditto	ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9*s.* to 18*s.*

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE

Improved and Newly Patented.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to Cottam & Hallen, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

FREDERICK PHILLIPS' PATENT.

THE PRIZE PULPING MACHINE of the Royal Agricultural Society's Show, held at Lincoln, July, 1854.

Of all the Pulping Machines which are before the Public, this is the only one which the Royal Agricultural Society certifies as "breaking the roots well,"—all others are certified as slicers (see their *Journal*, just published, page 373, also in the article on "Diminishing the Quantity of Roots in Fattening Cattle," page 490), and the great braggadocia "No Other," advertised weekly, although tried against that of F. P. and others, was not placed at all, in fact was "nowhere."

F. P. is happy to inform his numerous applicants for his Machine, that he has greatly simplified its construction without affecting its efficiency.

To be had of the Patentee, Brandon, Suffolk; of Mr. James Woods, Implement Manufactory, Stowmarket, Suffolk; or of the London Agents, Mr. William Dray & Co., Swan Lane, Upper Thames Street; or of Mr. Medworth, Implement Department, Baker Street, Bazaar.

Price, with boarded floor, 6*l.* 10*s.*; do. without do., 6*l.*

LOOKER'S PATENT VENTILATORS admit pure air without cold or draught. The cheapest arrangement yet introduced.—Particulars may be obtained of the Inventor and Manufacturer, Benjamin Looker, Jun., Kingston-on-Thames.

MOORE'S PATENT VENTILATOR, for every Description of Farm-Buildings, Conservatories, Hot-houses, Warehouses, Market-houses, Bell-turrets, also for Ventilating Shafts, &c.

These Ventilators are fitted to side-slips of wood with iron levers, iron flanges, and brass screws, with rough plate, or 32 oz. sheet glass, at 4*s.* per foot super. 2*s.* 6*d.* extra for necessary fittings to each Ventilator. If with brass levers in place of iron, 4*s.* per pair extra. It is presumed the accompanying drawing of a Greenhouse will show the advantages obtained (independent of a most perfect system of Ventilation, by admitting any amount of fresh air and distributing equally over the plants, &c., and at the same time emitting the vitiated), viz., a much neater appearance, and an uninterrupted view of the whole interior. Greenhouses at Mr. James Veitch, Jun., Exotic Nursery, King's Road, Chelsea; Messrs. Veitch & Sons, Nursery, Exeter; Messrs. Messrs. Perry, Nursery, Banbury; and the Pleasure Grounds at Hampton Court Palace; having been fitted with these Ventilators with perfect success, the Patentee has obtained permission to refer to the above places all parties desirous of seeing the same.

These Ventilators have been applied to many other Greenhouses, Conservatories, &c., but they are not published, in order to avoid giving unnecessary trouble. Fifty-four of these Ventilators, 5 ft. square (34 on the roof at an angle of 60 degrees), have been fitted at Her Majesty's Saltpetre Works, Waltham Abbey; the success of which has been proved by the fact, that the saltpetre is crystalised in little more than half the time, previously to the light and ventilation obtained by the adoption of these Ventilators.

Moore's double-current Ventilators for External Walls, &c. Ventilators for every description of apartment, from the Cottage to the Palace. Stained and Ornamental Glass if required. In taking the size, the exact opening should be given, stating the height and width distinctly. Tariff Prices of the ordinary Ventilators may be had on application at either of the above addresses. Packing cases allowed full price when returned free.

N.B.—These Ventilators can be readily fitted to Greenhouses already erected, by removing the entire sashes and fixing the Ventilators in their places.

Perfect Ventilation in all Cases Guaranteed.

Church, Turret, Musical and House Clock Makers, to the Lords of the Admiralty, the Hon. Board of Ordnance, the Emperor of China, &c.

London: 81, Fleet Street, London.—Manufactory, Sekford Works, Clerkenwell.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

A liberal allowance on Wholesale Orders. WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.—Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and [illegible] purposes of the best quality at a reasonable price.—Address the Proprietors, Inglis & Chisholm, Charles Street, Garratt, Manchester.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which RICHMOND AND CHANDLER have attained in the manufacture of Agricultural Implements; and the recent improvements made upon their various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated) are of the highest value in the economical preparation of food for cattle.—Address RICHMOND & CHANDLER, Salford, Manchester; and South John Street, Liverpool. Catalogues gratis.

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also, Wholesale and Retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.—DEANE, DRAY, & CO. (Opening to the Monument), London Bridge.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including bottle of metallic ink.—Sole Agents in London, Messrs. DEANE, DRAY & Co., Horticultural Implement Warehouse, 46, King William Street, London Bridge.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 1s. 6d. per bushel or 16s. per ton, delivered to any of the London wharfs or railways, or within a circuit of five miles. Peat and Loam of excellent quality. Sacks charged cost price.—KENNARD, BROTHERS, Swan Place, Old Kent Road, London.

FULLER'S EARTH WORKS, CHART LODGE, REIGATE, SURREY.
NOTICE.—SILVER SAND.

GAWKROGER AND HYNAM beg to inform the Nobility and Gentlemen, Gardeners, Nurserymen, Florists, and Seedsmen, that they are prepared to supply them with the REIGATE SILVER SAND, which is known by its superior whiteness and fine quality, and is much used in the Propagation and Growth of Greenhouse Plants, &c. It will be sent in fine bags, and delivered to any of the Railway Carriers, or Wharfs in London, in not less than ½ ton lots of 10 bushels, at the rate of 2/. per ton. Parties requiring lots of 4 tons and upwards can have the Sand delivered loose or in bags at the Bricklayers' Arms Station, or within five miles of the same, at a very low price.—For further particulars, apply at the Offices of JAMES GAWKROGER, 21, Union Street, Halifax, Yorkshire; and JOHN HYNAM, 7, Princes Square, Wilson Street, Finsbury, London.

TO BUILDERS.

FISHERTON ANGER CEMETERY, Salisbury, Wilts.—The Burial Board of the Parish of Fisherton Anger are desirous to receive TENDERS for the several works required to be done in erecting the Entrance Buildings, the Boundary Enclosures, and the two Chapels, and FORMING, LAYING OUT, and PLANTING the new Cemetery on the Devizes Road. The Plans and Specifications of the works may be seen at the Office of Mr. JOHN TURNER, 15, Wilton Street, London, the Architect, until the 27th instant; and at my Office, High Street, Salisbury, from the 28th instant until the 9th day of April next. The Burial Board will not object to receive Tenders for the separate Trades or for the whole works, but they do not bind themselves to accept either of them or the lowest Tender. The Tenders to be forwarded to me on or before the said 9th day of April next, marked on the outside *Tender for Fisherton Cemetery:* and if for either of the Trades, stating which. The Contractor or Contractors will be required to give such security as the Board may require for the due performance of the work agreeably to the plans and the general conditions and specifications, such security to be prepared at his or their expense.

G. SMITH, Clerk to the said Board.

Salisbury, March 31.

NURSERY AND SEED BUSINESS,
ESTABLISHED IN THE YEAR 1849.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, beautifully varied, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.—Apply to Mr. YOUNG, the Proprietor, Blue Cottage, Taunton.

TO BE LET IMMEDIATELY, a capital FARM in Lincolnshire, of 400 acres.—W. G. STEWARD, Lincoln.

TO BE LET ON LEASE, for a Term from Michaelmas next, with the usual entry forthwith, a highly reputed CORN and STOCK FARM, in North Hants, very compact, and with Market and Railway facilities. Content 1[illegible]57 acres.—To view and treat apply to LAMB, BROOKS, & Co., Solicitors, Basingstoke, or Odiham, Hants. (Reference as to substance and character will be required.)

KING'S COUNTY, IRELAND.

TO BE LET, with immediate possession, the DWELLING-HOUSE, OFFICES, and DEMESNE LANDS of COROLANTY, containing 100 acres, late Irish plantation measure, together with 50 acres of Bog attached, situate within one mile of the town of Shinrone, and five of Parsonstown and Roscrea, both first-class inland towns. The House, upon which a large sum has just been expended, is in perfect repair, and contains Breakfast, Dining, and Drawing Rooms, Study, eight Bed Rooms, Kitchen, and all necessary servants' apartments; attached are two large yards with extensive offices, as a large walled-in garden, well stocked with Fruit trees. The Lands are mostly of prime quality, well watered and sheltered, and well suited for all agricultural purposes. The neighbourhood is remarkably quiet and the public burdens very moderate. To a solvent tenant a long lease will be given; none other need apply.—For further particulars, apply to JOSEPH J. WALKER, Esq., Belfield, Shinrone, Ireland; or Mrs. PALMER NUNN, 13, York Terrace, Leamington, Warwickshire. The Caretaker residing in the house will show the Lands.

TO BE SOLD, by private treaty, a NURSERY and PLANT BUSINESS, established nearly 70 years. The Proprietor of this old-established Nursery Business is willing to retire, and dispose of the Stock and Good-will. The nursery comprises about 20 acres of ground, and about 15 large and commodious Stove, Greenhouse, and Propagating Houses, with numerous Pits, frames, &c. *The business is in full working order, and is capable of being increased to almost any extent, and of being made one of the best provincial nurseries in the kingdom.* The stock is in a flourishing condition, being young, healthy, and in good saleable order, and comprises a general assortment of all the most saleable Forest Trees, Shrubs, Fruit Trees, Stove, Greenhouse, and Miscellaneous Plants. The Nurseries are situated close and adjoining one of the largest towns in the West of England, with a population of more than 100,000 inhabitants. The whole of the land, houses, &c., belongs to the proprietor, *who will have no objection to grant a long lease to his successor or successors, and at least one half of the purchase money could remain on security at common interest.* The business has been carried on with great success by the present proprietor, which partly contributes to his retiring from the business. None but principals and *bonâ fide* purchasers will be treated with.—Apply to Mr. WILLIAM E. RENDLE, Union Road, Plymouth.

TO NOBLEMEN, GENTLEMEN, AND OTHERS.

TO BE SOLD, a great bargain, a Large VINERY, about 100 feet long by 22 feet deep, consisting of 48 top lights and 24 front sashes, with wrought-iron uprights, and iron rods to train the Vines to; two glass ends, and two glass divisions with pulleys, &c. &c., complete. The lights are 3-inch stuff, and in very excellent condition. The whole to be sold a bargain, as it must be cleared in a short time.—Apply within one week to Mr. BIRD, Florist, Green Lanes, Stoke Newington, London. Such a chance may never occur again.

TO BE SOLD, a ZEBRA BULL, and TWO COWS heavy in calf, all bought at the late Knowsley Sale, 25*l.* the three.—Apply to D. F. N., Dangstein, Petersfield.

TO BE SOLD, a pair of young PEA-FOWL, in splendid plumage, price Three Guineas.—Mr. JOSH. NEWMAN, Chesterton Farm, near Cirencester.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

MR. J. WILLMER will Sell by Auction, at the Auction Mart, Bartholomew Lane, on TUESDAY, April 3, at 12 o'clock, a choice collection of Carnations and Picotees, Pinks, Dahlias in dry roots, Pæonies, Climbing Roses in pots, &c.—May be viewed the morning of sale, and Catalogues had at the Mart, and of the Auctioneer, Sunbury, Middlesex.

ORCHIDS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, April 10, at 1 o'clock precisely, a collection of Established ORCHIDS, in fine health, and including the following choice varieties:—

Aerides crispum	Cattleya Acklandæ
„ suavissimum	„ labiata
„ cornutum	„ superba
Saccolabium guttatum	Oncidium sarcodes
„ Blumi major	„ Barkeri
„ retusum	Cymbidium eburnum
„ miniatum	Trichopilia coccinea
Vanda tricolor	„ tortilis
„ insignis	Odontoglossum hastilabium

May be viewed on the morning of sale; and Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO GENTLEMEN, NURSERYMEN, FLORISTS, & OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on TUESDAY and THURSDAY, April 3d and 5th, at 12 o'clock, a First Class Collection of CARNATIONS, comprising Justice Shallow, S. F., Jenny Lind, Puxley's, C. B., Valentine, S. F., Ascendant, P. F., Garland, R. F., Poor Tom, R. F., Admiral Curzon, S. B., Beach Diamond, C. B., Lord Milton, C. B., Falconbridge, P.P.B., Beauty of Woodhouse, P. F., Bardolph, &c.; PICOTEES, among which are Mrs. Keyne's, P. P., ex., Countess, P. P., Mrs. Barnard, Magnificent, R. P., Haidee, P. P., Duke of Rutland, Prince of Wales, R. P., Green's Queen, R. P., Bloomer, P. P., &c.; and PINKS, including Mrs. Lewis, Mrs. Woolf, Great Britain, Hebe, Narboro Buck, Teddington, Sappho, Desdemona, Purple Perfection, Harry, &c. Also a superb Collection of fine Hollyhocks, from a celebrated Grower; a choice assortment of Standard and Dwarf Roses; American Plants; choice Dahlias in dry roots; Pæonias, Verbenas, Fuchsias, &c.—May be viewed the morning of sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BANKS' SEEDLING FUCHSIAS.—1855.

For Full Description see Former Advertisements, and on Application).

W. J. EPPS has much pleasure in stating that the above Fuchsias have been proved to be the finest that have been raised by that celebrated grower E. Banks, Esq., Deal. Early orders are solicited. The set of six, 2*l.* 2*s.* The usual discount to the trade.—Bower Nurseries, Maidstone.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s.*; 12 varieties, 2*s.* 6*d.*; and from good double sorts, 1*s.*

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s.* per packet; separate, 2*s.* Fine Quilled African Marigolds, 6*d.* per packet.—Saffron Walden Nurseries.

BOSSOM'S CHAMPION OF ENGLAND CELERY.

THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. Winstanley, Seedsman, 28, Market Place, Manchester, price 2*s.* 6*d.* per packet; prices to the trade on application.

J. IVERY and SON beg to say that the two AZALEAS, CRITERION and ADMIRATION, sent out by them last autumn, may now be seen in bloom at their Dorking Nursery, plants of which may be had from 21*s.* to 42*s.* each.—Dorking, March 31.

TO PLANTERS.

HAY, SANGSTER, and CO., have for sale the following;—600 to 700 strong Standard PEARS, 500 Dwarf do., and 100 Dwarf-trained do. Any reasonable offer will not be refused, as the ground must be cleared immediately.

Apply to Hay, Sangster, & Co., Newington Butts, London; of whom also may be had for seed York Regent Potatoes, 6*s.*, and Early American, 8*s.* per bushel of 56 lbs., the produce of their prepared Cuttings. Terms cash.

NOTICE TO THE TRADE.

JOHN ADAMS, Nurseryman and Seedsman, High Street, near the Market Place, New Brentford, Middlesex. Nursery Grounds at Acton Green, established several years.

John Adams begs to inform his kind friends and patrons that he intends carrying on the above business on a large scale, and begs a continuance of their kind favours, and that nothing on his part shall be wanting to give entire satisfaction.—Brompton Park Nursery, March 31.

RARE AND CHOICE FLOWER ROOTS,

At very Reduced Prices.

LILIUM LANCIFOLIUM RUBRUM, 2*s.* each, or 21*s.* per doz.
GLADIOLUS GANDAVENSIS, 3*s.* per dozen, or 21*s.* per 100.
The above are strong flowering roots.

To be had of William Denyer, Seedsman and Florist, 82, Gracechurch Street, London.

Catalogues of all the New and Choice Flower and Vegetable Seeds forwarded on application.

SPRING FLOWERS.—CINERARIAS, good flowering Seedling Plants, 4*s.* to 6*s.* per doz.; fine named varieties, 6*s.* to 9*s.*

HYACINTHS in pots, various colours, just showing bloom, 4*s.* per doz.; also a few very fine named flowers, many of which are catalogued at 1*s.* to 1*s.* 6*d.* each, in the same state as the above, 9*s.* per doz.

FINE HERBACEOUS CALCEOLARIAS, from Major's seed, in large and small 60 pots, 4*s.* to 6*s.* per doz.

Wood and Ingram, Nurseries, Huntingdon.

BEAUTIFUL FLOWERS.—Twelve packets, each packet containing 100 Seeds, 1*s.*; sent free per post, 1*s.* 2*d.*; a 5*s.* packet sent free per rail. Abronia umbellata, Eccremocarpus scaber, choice Gloxinias, Lophospermum Hendersoni, Lisianthus Russellianus, and every other choice variety 6*d.* per packet. Dwarf German (10 week) Stocks, as imported, 36 varieties, each variety 3*d.* per packet.—Wm. Cullingford, 1, Edmund Terrace, Ball's Pond, Islington, London.

N.B. Elletson's superb new late Dwarf White Broccoli Seed ("Emperor"), 2*s.* 6*d.* per packet. The Broccoli raised from this seed weigh from 17 lbs. to 25 lbs. each.

FLOWER SEEDS.—Twelve separate varieties of choice Hardy Annuals, 1*s.*; 25 ditto, 2*s.*; 50 ditto, 4*s.*; 100 ditto, 8*s.* The name, height, and colour described on each variety. Scarlet Runners and Dwarf French Beans, 1*s.* 6*d.* per quart; and every kind of Vegetable and Flower Seed in Cultivation (of the best quality) at very low prices.—Robert Green's Seed Warehouse, 154, Kingsland Road, London.

NEW EVERGREEN CLIMBING ROSE.

WILLIAM WOOD and SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, beg to intimate to their friends that they are now prepared to send out at once good strong plants of WILLIAMS' EVERGREEN CLIMBING ROSE, at 3*s.* 6*d.* each, with the usual allowance to the trade, and a still further reduction if one dozen or more are ordered at once. Price may be had on application.

N.B.—Single Plants will be sent free per post on receipt of six penny postage stamps extra to defray postage. Strong Plants of the above may also be obtained at the same price from Mr. Charles Turner, of the Royal Nursery, Slough.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s.* per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. Cobbett's Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

THOMAS BEACH, the well-known Strawberry Grower, begs to say that he has now ready a large stock of fine strong Plants of his TRUE BRITISH QUEEN, the same he beat the whole world with at the Crystal Palace, many weighing from 2 to 3 oz. each, likewise the same he gained the Knightian Medals with at Chiswick, and other places. He has gained the head prize, and surprised the world, both in flavour and weight. Strong Plants sent to any part of the world, at 5*s.* per 100, box included.

Post-office Orders on Hounslow, to Mr. Thomas Beach, Strawberry Grounds, Worton, Isleworth, Middlesex.—March 31.

TO NURSERYMEN, SEEDSMEN, ETC.

MESSRS. E. G. HENDERSON and SON having had (through their customers), a Seed Catalogue brought under their notice, and which seems to have been distributed throughout the whole of their connection, published by a very eminent and old established firm near London; and on referring to the same they find that all the Hardy Annuals from Nos. 1 to 308, the Half-hardy Annuals from Nos. 309 to 479, Hardy Biennials and Perennials from Nos. 480 to 660, and the Greenhouse Plants and Tender Annuals from Nos. 661 to 741 have all been copied from their lists, with the full descriptions of colour, height, treatment, and other information, even the numbers attached to each article correspond with the strictest accuracy. The only alteration is that no prices are attached, whereas, in the original catalogue every article is priced.

Messrs. E. G. H. & Son beg to say, that as they are at some considerable expense and trouble preparing and issuing their Catalogues throughout the year, they now give notice that in future they shall consider it very disreputable in any parties copying them in the style above alluded to, unless the source from which they derive their information is published at the time, or otherwise communicating with them previously to copying the same.

Wellington Nursery, St. John's Wood, London.—March 31.

GOOSEBERRIES AND CURRANTS.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE is now ready, and will be forwarded free on application.

GEORGE GIBBS & CO., Seedsmen,
26, Down Street, Piccadilly, London.

TO WHEAT GROWERS.

PETER LAWSON and SON, the Queen's Seedsmen, Edinburgh and London, have received from North West America a small quantity of two new kinds of WHEAT, which they are sending out in packets containing 200 grains. One kind is named Club-headed, cultivated by the old Canadians. The yield is said to be very large, and forms a very beautiful delicate-coloured sample. Price 20*s.* per packet, containing 200 seeds.

The other kind is evidently a variety of Triticum durum, with solid stalks. It is very early, and well adapted for spring sowing. Price 15*s.* per packet, containing 200 seeds.—Orders may be sent to Peter Lawson & Son, in Edinburgh; or direct to their London House, 27, Great George Street, Westminster.

BEDDING AND OTHER PLANTS.

F. and A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Cinerarias in variety, Primula sinensis, Acacia armata, Deutzia gracilis, Erica Willmoreana, &c. The Trade supplied.—Dulwich, Surrey. March 31.

WHEELER and SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year: and as we deliver our Seeds Carriage Free, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. Wheeler & Son, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

JOSEPH FRYER, Clarendon Nurseries, Camberwell, begs to state that he can supply fine Standard, Standard trained, Dwarf and Dwarf-trained Apples, Pears, Plums, Cherries, Peaches and Apricots, many of them large and in a bearing state; fine Mulberries, Figs, Walnuts, Quinces, Raspberries, Gooseberries, and Currants, Strawberries, fine strong Seakale, Asparagus, &c. A great variety of Ornamental Trees and Shrubs of all sizes, American Plants, Standard and Dwarf Roses. A general collection of Greenhouse, Herbaceous, and Bedding Plants, Vegetable and Flower Seeds, &c. Most of the above can be supplied to the trade.—N.B. *Gravel, Loam, Bog Mould, Manure, Silver Sand, &c., in any quantity.

WILLIAM IVERY, Hanover Nursery, Peckham, near London, begs to inform his friends and the public that his SPRING CATALOGUE is now ready, and may be had on application; it contains all the choicest Geraniums, Fuchsias, Verbenas, Cinerarias, Antirrhinums, Petunas, large and Pompone Chrysanthemums, Indian Azaleas, Phloxes, Herbaceous and other Miscellaneous Plants.

W. I. has a well-rooted stock of Hamburgh and other Vines from eyes; also a fine selected stock of Plants of all kinds for Bedding, at reasonable prices, such as Geraniums, Golden Chain, Flower of the Day, Trentham Rosy Scarlet, Lady Cotteniham, Lilac, and Rollisson's Unique, &c.—Post Office orders made payable at Peckham.

CEDRUS DEODARA.—From 100 to 200 of the above, from Seed, 3 to 4 feet in height, and as much thereof, splendid specimens, transplanted last year, can be supplied at 7*s.* 6*d.* each, or 84*s.* per dozen.

ARAUCARIA IMBRICATA, fine plants, 15 to 18 inches, stout and bushy, 5*s.* each, or 42*s.* per dozen.

Larger sizes of the above if required.

Youell & Co., Royal Nursery, Great Yarmouth.

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, handsome as any frame variety, and is as delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of Youell & Co., who will forward per post free (on receipt of postage stamps) packets containing 8 Seeds, 1*s.*; 18 Seeds, 2*s.* 6*d.*—To Market Gardeners the above will be found a great acquisition.

Royal Nursery, Great Yarmouth.

TO POTATO GROWERS.—ROSS'S AMERICAN EARLY, grown expressly for Seed on reclaimed Peat Moor without manure. This well-known productive Potato cannot be equalled as a "second early;" price 21*s.* per sack of 2 cwt.

WALKER'S LARGE WHITE.—This variety is about two weeks later than the preceding, and for general crops cannot be surpassed. It grows to a large size, is an extraordinary cropper, and for table use is all that could be desired; price 24*s.* per sack of 2 cwt. *These prices include a strong sack, and carriage paid to London, Liverpool, and Hull.*

W. DRUMMOND and SONS, Seedsmen, Stirling, N.B.

*** To prevent disappointment unknown correspondents will enclose a remittance with their order.

SUPERB NEW HYBRID HEATHS.

LUCOMBE, PINCE, and CO., are now prepared to send out their beautiful well-known New Hybrid HEATHS, they were exhibited at the Horticultural Society's meeting in Regent Street, and obtained the large Silver Medal. The following is the description given by the Editor of the *Gardeners' Chronicle*, May 28, 1853:—

"Messrs. Lucombe, Pince, and Co. *received a Large Silver Medal for a collection of new Hybrid Cape Heaths, consisting of Lindleyana, Exomiensis, Insignis, Pulchellima, Exquisita, and Metulæflora superba, all fine kinds, possessing large bold flowers and bright clear colours; they were stated to have been raised from Massonii, Ampullacea, Sprengelli, Hartnelli, and Aristata, and will be seen good parents.*"

L., P., and Co. can assure all cultivators of this beautiful tribe of Plants that these fine varieties cannot fail to give satisfaction, as they possess excellent habits and have large rich coloured flowers of much substance, which are produced in great profusion, properties that fully justify L., P., and Co. in very strongly recommending them to the public. Price, 3*l.* the set of six.

Exeter Nursery, Exeter. Established 1720.

Printed by William Bradbury, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 37, Verney Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be Addressed to the Editor.—Saturday, March 31, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

Scarlet Runners and Dwarf French Beans, 1*s*. 6*d*. per quart; and every kind of Vegetable and Flower Seed in Cultivation (of the best quality) at very low prices.—ROBERT GREEN'S Seed Warehouse, 154, Kingsland Road, London.

CHEAP NURSERY STOCK.

IMPORTANT TO ALL PLANTERS WHO DESIRE IMMEDIATE EFFECT.

WILLIAM JACKSON & Co., Bedale, Yorkshire, beg to refer to their advertisement in the *Gardeners' Chronicle and Agricultural Gazette* of the 17th March, page 181.

WANTED, a few Thousands of STRONG QUICKS.—Apply, stating size, age, quantity, and price, to A. Z., Messrs. Wrench & Sons, London Bridge.

TWO HUNDRED AND TWENTY-FIVE SUCCESSION PINES FOR 1856–57, to be seen at the late residence of Mr. Alderman Copeland, Leyton, Essex.—Particulars of Messrs. Low, Upper Clapton.

THRIVING YOUNG OAKS FOR SALE.—A large quantity of clean well-grown Oaks, 2 ft. 6 in. to 6 ft. high, to be sold or exchanged for other trees; to be removed in the autumn of the present year. Particulars may be ascertained on application to Mr. C. J. NEALE, Land Agent, Mansfield, Notts.—April 7.

TO BE SOLD CHEAP, 3000 transplanted WALNUT TREES, 3 to 4 feet high. Price on application.—WILLIAM MOORE, Norfolk Nursery, East Dereham.

TO BE SOLD CHEAP, price 60*l*., a small private Collection of ORCHIDS (180 Plants).—Apply to Messrs FRASER'S, Nurserymen, Lea Bridge Road, Leyton, Essex.

TO BE SOLD, 124 dozen GOLDEN CHAIN GERANIUMS, and a parcel of HOLLYHOCK SEED from a gentleman who grows all the best flowers. Price according to the quantity required; the trade will be liberally dealt with. Only a few packets of the beautiful Primulas left. The Ipswich Standard Cucumber is sold out.—THOMAS WILD, Ipswich.

TO WHEAT GROWERS.

PETER LAWSON AND SON, the Queen's Seedsmen, Edinburgh and London, have received from North-West America a small quantity of two new kinds of WHEAT, which they are sending out in packets containing 200 grains. One kind is named Club-headed, cultivated by the old Californians. The yield is said to be very large, and forms a very beautiful delicate-coloured sample. Price 2½. per packet, containing 200 seeds.

The other kind is evidently a variety of Triticum durum, with solid stalks. It is very early, and well adapted for spring sowing. Price 15s. per packet, containing 200 seeds.—Orders may be sent to Peter Lawson & Son, in Edinburgh; or direct to their London House, 27, Great George Street, Westminster.

RENDLE'S IMPROVED SWEDE TURNIP.—*This is the most hardy variety in cultivation, and has stood the late severe winter, in the most exposed situations, without the least injury. The Subscribers have received scores of letters during the past month to confirm this statement.*

It is handsome in form. Small tap roots, will keep longer than any other sort, and is altogether a most valuable variety.

It has been selected with much care for the last seven years, and the present stock has been saved by growers of the first respectability. Price 2s. per lb., or 1s. 9d. per lb. if taken by the cwt. Wholesale Dealers can be supplied with a few bushels.

For Description, Testimonials, and Engraving, see RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY."—Apply to William E. Rendle & Co., Seed Merchants, Plymouth.

SPLENDID NEW HOLLYHOCKS.

G. SMITH respectfully informs the admirers of the HOLLYHOCK that the following are Seedlings of great merit, and cannot fail to give entire satisfaction. They were raised by Mr. Parsons, the grower of Joan of Arc, and other fine varieties. To be sent out about the middle of April, 1855, in strong healthy plants.

	s.	d.
Eclat, yellow and buff, a nice full flower	3	6
King of Yellows, large, of fine form, flower full, extra fine yellow	7	6
Marchioness, flesh or blush, very double and close, fine for exhibition	3	6
Monarch, a true salmon, very large and fine shape ...	7	6
Mr. Adams, dark salmon pink, a noble show flower ...	5	0
Pearl, blush white, large and distinct	5	0
Pillar of Roses, a beautiful bright rose, a splendid spike, the finest border flower yet offered, and a most attractive show flower	5	0
The Alma, cherry rose, distinct, fine shape	5	0
White Unique, very close and double	3	6
Sarah, a splendid large rose, fine form and spike	5	0

Tollington Nursery, Hornsey Road, Islington, London.

MESSRS. WILLIAM ROLLISSON AND SONS embrace this medium of announcing that they will commence sending out the first week in May the annexed three new ERICAS, which they can with the greatest confidence recommend, and which will doubtless be as universally admired as the sorts hitherto introduced by them, among which we may name Cavendishi, jasminiflora, Hartnelli, Ventricosa superba, mutabilis, tortulæflora, Tricolor elegans, Sprengeli.

ERICA ÆMULA.—This is a very beautiful hybrid in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour; altogether this is a very distinct variety. 21s.

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent whose name it bears; it is a very compact grower and excellent habit, with tubular blossoms of a fiery scarlet colour. This charming variety obtained the First Seedling Prize at the Royal Botanic Gardens, 1852. 31s. 6d.

ERICA PAXTONI.—A very distinct variety, obtained by hybridising Erica Hartnelli with Erica Massoni. It blossoms in very large whorls, of a soft red colour. This variety will be very useful for autumnal exhibition purposes, as it blossoms from July to October 21.

The Set of the above named Ericas three guineas.

The Nurseries, Tooting, London.

GERMAN ASTER SEED, all saved from the finest Globe varieties, ever yet exhibited, and which have surpassed all others in cultivation for their immense size and distinct colours, 1s. per packet.

SWEET WILLIAM SEED saved from 50 of the choicest and most superb varieties, 1s. per packet.

ANTIRRHINUM SEED saved from all the finest shaped and best varieties, 1s. per packet.

SUPERB HOLLYHOCK SEED saved from all the best named flowers, 1s. per packet.

SCARLET GIANT BROMPTON STOCK, extra fine, 1s. per packet.

VERY SUPERIOR FIMBRIATA PRIMULA SINENSIS SEED, saved from six distinct varieties of the largest and most superb plants ever grown, 2s. 6d. per packet.

PANSY SEED, a few packets from selected varieties, 1s. per packet.

POLYANTHUS SEED, fine mixed, 1s. per packet.

CROWN GOURD, or CUSTARD MARROW; this variety is the most delicious of all the Marrows grown, 1s. per packet.

AQUILEGIA, or COLUMBINE, of 12 distinct varieties, 1s. per packet.

Any three packets of the above (except the Primula) sent post-free on receipt of 2s. 6d., or the Primula included with two other packets, for 3s. 6d., in cash or penny postage stamps by

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

BASS AND BROWN'S CHOICE VEGETABLE AND FLOWER SEEDS.

For some of the novelties of their first-rate Collections, also choice imported Seeds, Roots for early spring planting, &c., see Advertisements in the Gardeners' Chronicle *of Feb. 17, page 109, and March 10, page 149.*

For further particulars see Seed and Plant List.

CHOICE IMPORTED SEEDS, comprising Stock, Aster, Balsam, Cockscomb, Larkspur, Salpiglossis, Scabious, Sinecia, Sweet William, Wallflower, Zinnia, &c.

Bass & Brown's Seed and Plant List free by post for three penny stamps. Also the autumn Catalogue for three penny stamps; or gratis to our customers who may not have received them.—Seed and Horticultural Establishment, Sudbury, Suffolk.

Reduced Price.

WARD'S OMER PACHA STRAWBERRY.

WILLIAM JAMES WARD respectfully informs his friends and the public that he has still a few well-rooted plants to offer of the above excellent Strawberry, which obtained the Bronze Medal at the Royal Botanic Garden Exhibition, July 5, 1854.

It was submitted for opinion to Mr. Thompson, Horticultural Society, Chiswick; Mr. Marnock, Royal Botanic Gardens, Regent's Park; Mr. Powell, Royal Gardens, Frogmore; Mr. Spencer, Bowood Gardens; and several others: all of whom speak highly favourably of it.

The following extract, accompanied with a woodcut, appeared in the "Florist and Fruitist," September, 1854, in the descriptive list of new Strawberries:—

"Omer Pacha.—This variety is a seedling raised by Mr. Ward from British Queen, fertilised by the old Caroline Pine, two good kinds, of which the present variety seems to be a combination. The samples I received were fine looking fruit, and of good quality."

W. J. W. warrants it of very superior flavour, and well adapted for long carriage.

100 Plants	£2	0	0	25 Plants	£0	15	0
50 „	1	5	0	12 „	0	8	0

Terms, cash.—Prospect Hill, Reading, April 7.

FRUIT TREES IN POTS.—As the fruit seasons have been for late years so unfavourable, the undermentioned offer an opportunity for growing it, so that the crop is certain and can even be put on table on the trees. They consist of the following, well set with bloom buds, Apples, Apricots, Currants, Figs, Gooseberries, Nectarines, Peaches, Pears, Plums. Also a fine assortment of the best Vines from eyes, and Strawberries for forcing; dwarf-trained Cherries, Nectarines, Peaches, Pears, Plums; standard-trained Apricots, Nectarines, Peaches, Pears; pyramidal Apples and Pears; standard Apples, Cherries, Pears, Plums; also Currants, Gooseberries, &c.

H. Lane & Son, The Nurseries, Great Berkhamsted.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out the following New Plants on the 30th April next:—

HYDRANGEA HORTENSIS, flore pleno, 10s. 6d.

PHLOX QUEEN VICTORIA, 5s.

DAHLIA EMPEROR FRANCIS JOSEPH (variegated foliage), 10s. 6d.

SHRUBBY BEDDING CALCEOLARIAS.

Brunette	7s. 6d.	Norma	7s. 6d.
Coreggio	7 6	Red Rover	7 6
Maggiore	7 6	Vezzosa	7 6
Minnie...	7 6	Wildfire	7 6

Or the set of eight varieties, 2l. 2s.

With the permission of Mr. C. Turner they will offer his new CALCEOLARIA PURITY (the best white bedding variety) at 7s. 6d. each, or with the above set 2l. 7s.

FUCHSIAS.

Queen Victoria (Story)	10s. 6d.	Lady of the Lake (Story)	10s. 6d.
Prince Albert (Banks) ...	10 6	Water Nymph (Story) ...	10 6
Perrugino (Story)	10 6	Raffaelle (Story)	10 6
Empress Eugenie (Story)	10 6	Mrs. Story (Story)	10 6
Ranunculæflora (Story)...	21 0	Snowdrop (Story)	10 6

Or the set of ten varieties, 4l. 4s.; or without Ranunculæflora, 3l. 3s.

FUCHSIA BANKS' FAVOURITE (Banks), 10s. 6d.

For full particulars of the above see back numbers of this Paper. Any further orders for some of the above Fuchsias cannot be executed till after the second week in May.—April 7.

Great Novelties for the Ensuing Season,

FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE, AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA

(The Double Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double Snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10s. 6d. each.

Together with a very beautiful new double Purple variety,

VIOLÆFLORA-PLENA,

Rich double blue corolla, resembling a fine double violet, 7s. 6d. each.

L., P., & Co. have also fine plants of the following choice kinds of Fuchsias at 18s. to 42s. per dozen.:—

Aspasia	Glory	Purple Perfection
Apollo	Lucretia	Sir Harry Smith
Brilliant	Orion	Sidonia
Duchess of Lancaster	Prime Minister	Sir Jno. Falstaff
Duke of Wellington	Princess	Telegraph
Dominiana	Kossuth	Resplendent.

They are also now prepared to send out their beautiful new

VERONICA KERMESINA,

Raised by that eminent horticulturist J. Luscombe, Esq., of Coombe Royal, who sent specimens to Dr. Lindley, at the time of its first flowering, who thus pronounces his first opinion of it:—"The variety sent with this was charming, a decided rose colour having mingled with the violet." See also notice of Dr. Lindley in the *Chronicle* for Dec. 2, 1854, as follows:—"L., P., & Co. Your V. Kermesina is a handsome dark variety of V. speciosa; its beautiful large spikes of deep purplish crimson blossoms cannot fail to make it a favourite." Price 7s. 6d. each. A few extra-sized specimens may be had.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—Established in 1720.

CHARLES TURNER begs to recommend the following Seeds:—

SABBATIA STELLARIS.—This beautiful Greenhouse Annual was raised at the Royal Gardens, Frogmore, from seed received from Texas, and was exhibited at the Horticultural Society's July Show, at Chiswick, and was awarded a First Class Certificate. It is of a deep rose colour, with a yellowish-green eye, and sweet-scented. It should be grown in a mixture of half leaf-mould, with the other half comprised of light peat, loam, and silver sand, and sown in a little heat. 2s. 6d. per packet.

NEW CUCUMBER, "WARD'S IMPROVED SION HOUSE," superior either to the "Improved Sion House" or "Lord Kenyon's Favourite," for winter use. Mr. Ward, of Prospect Hill, Reading, who raised it, writes—"I can strongly recommend it as the best winter sort I ever met with; and it always swells out, not plumber's iron fashion, as is the case with many sorts, and equal in bearing to Lord Kenyon's Favourite, generally throwing three or four fruit together." Price 1s. 6d. per packet.

	s.	d.
HOLLYHOCK SEED, saved from the newest and finest sorts in cultivation, per packet	2	6
„ „ smaller packets, each	1	6
DAHLIA SEED, saved from the very best exhibition flowers, per packet	2	6
„ „ smaller packets, each	1	6
CALCEOLARIA, extra quality, per packet...	2	6
CINERARIA, extra quality, do.	2	6
HEARTSEASE, from best show flowers, do.	2	6
„ „ „ smaller packets, each	1	6

The new white bedding Calceolaria "Purity," the entire stock of which is in Charles Turner's hands, also his new Dahlias, new Verbenas, &c., will shortly be advertised.

Royal Nursery, Slough.

NEW EVERGREEN CLIMBING ROSE.

WILLIAM WOOD AND SON, Woodlands Nursery, Maresfield, near Uckfield, Sussex, beg to intimate to their friends that they are now prepared to send out at one shilling strong plants of WILLIAMS' EVERGREEN CLIMBING ROSE, at 3s. 6d. each, with the usual allowance to the trade, or a still further reduction if one dozen or more are ordered at once. Price may be had on application.

N.B.—Single Plants will be sent free per post on receipt of penny postage stamps extra to defray postage. Strong Plants of the above may also be obtained at the same price from Mr. Charles Turner, of the Royal Nursery, Slough.

NEW ROSES.

MESSRS. WILLIAM ROLLISSON AND SONS beg to offer the following new Roses, which they will be able to supply in good healthy plants the first week in May, at 7s. 6d., established in pots. Purchasers wishing for a less number than here enumerated, by leaving the selection to ourselves, may depend upon having the best and most desirable varieties chosen for them.

HYBRID PERPETUALS.

Abadie de Rougemont, bright crimson, very fine.
Baron Larray, fine rose, and beautiful shape.
Belle Lyonnaise, very double, blush white.
Clecron, very curiously mottled, dark crimson and white.
Comtesse de Marennes, rosy lilac, tinted with carmine.
„ d'Orleans, delicate rose.
„ de Turennes, beautiful light flesh colour.
„ de Vaillant, light violet.
Deuil de Frederic Villermoz, purple velvet shaded with lilac.
Docteur de Varennes, rosy purple.
Duchesse de Cambacérès, bright rose, very sweet.
Empereur Napoleon, bright scarlet.
Etendard des Amateurs, very bright rosy purple.
Eugenie Poilleaux, bright carmine.
Evêque de Meaux, rosy velvet.
Folichonne, bright crimson. Gloire de Vitry, rosy crimson.
Julie Guinoiseau, delicate glossy rose colour.
La Fontaine, bright crimson. Leon Raimaux, bright glossy crimson.
Lord Raglan, scarlet and crimson.
Louise de Châteaubourg, bright rosy crimson, very sweet.
Madame de Trotter, bright red.
„ Hitz, beautiful flesh colour.
„ Latour, very delicate pink.
„ Massan, bright velvety crimson, changing to violet.
„ Place, bright delicate pink.
„ Theodore Martell, blush white, tinged with pink.
„ Vidot, delicate blush, shaded with pink.
Marie Liabaud, rosy pink.
Maxime, rosy violet in the centre, and shaded.
Monsieur Pigeron, very large, deep crimson.
Nouvelle Etendard du Grand Homme, pale apricot colour.
Panaché d'Orleans, soft rose colour striped with red and purple.
Perfection, dark crimson, shaded with carmine.
Prince de la Moskowa, dark crimson.
Raphaël, bright rosy crimson.

TEA-SCENTED ROSES.

Baronne de Savigny, blush white, darker centre.
Blanche de Solleville, white shaded with cherry colour.
Louise de Savoie, yellow.
Madame Barillet Deschamps, white tinged with yellow.
Souvenir d'Elisa, pale yellow, centre white.

NOISETTE.

Polonie Bourdin, salmon colour, yellow centre.

BOURBON.

Auguste Pajol, bright cherry colour.
Camille de Châteaubourg, red, shaded with purple.
Emilie Miret, carmine. Etoile du Nord, bright red.
Ferdinand Deppe, purplish velvet, fine.
Frilet, bright crimson. Isabelle, bright rose colour, very fragrant.
Josephine Chambert, cherry colour.
Marguerite Dubourg, bright red. Omer Pacha, dark purple.

PERPETUAL MOSS ROSES.

Madame Edouard Ory, bright rosy carmine.
Salet, bright red in the centre, and beautifully shaded.

The usual discount to the trade when a dozen sorts are taken.

The Nurseries, Tooting, London.

GEORGE SMITH has much pleasure in offering the undermentioned strong Plants, ready for delivery about the 20th of April, 1855, feeling the greatest confidence in recommending them as possessing first-rate qualities:—

VERBENAS.

BOULE DE FEU (Young), bright orange scarlet, with conspicuous lemon eye; pip large, of fine form, compact truss of good size, the habit excellent, a most profuse bloomer, the finest scarlet ever offered. First class certificates at the National, Royal South London and North London Floricultural Societies.

LORD RAGLAN (Banks), crimson scarlet, large lemon eye, pip and truss large, of fine form. This will be found a noble variety.

EMPRESS (Smith), pure white, with conspicuous rosy purple centre, pip and truss large, smooth and compact. One of the very finest of the light varieties.

MRS. M'NIEL (Smith), brilliant rose with large lemon eye, truss and pip large, of exquisite form, and very beautiful, in the style of Beauty of Hornsey.

VIOLACEA (Smith), intense violet, with a very conspicuous large white eye, pip and truss large, of good form. This flower will be found most remarkable and beautiful, either for bedding or exhibition. It is something in the way of M. Paquin, with the colour much more intense, and a fine free grower.

SILISTRIA (Smith), pale lilac, shaded with rose, very large and compact. First class at the Royal South London Horticultural Society. The set of six for 24s., or 5s. per plant.

FUCHSIAS.

The following four Fuchsias are fine show flowers, plants of good growth, and very free blooming kinds that must be grown in all good collections:—

OMER PASHA (Smith), tube short and stout, sepals well reflexed, of bright waxy crimson scarlet, corolla deep violet purple, large, of good shape, fine habit, free in growth and profuse bloomer. A fine plant for exhibition. 7s. 6d.

ORLANDO (Smith), dark tube and sepals reflexed, with an intense dark corolla. 3s. 6d.

CORONET (Smith), white tube and sepals, corolla violet, good shape, very free. 3s. 6d.

NIMROD (Smith), white tube and sepals, corolla light purple, good form. Plant of strong growth, and a very free bloomer. 5s.

SCARLET GERANIUMS.

BEAUTY OF COMB BANK, intense scarlet, eye white, pip large and circular, truss very large, dwarf habit, with handsome foliage. A first class bedding variety. 5s.

CHEPSTEAD BEAUTY, fiery crimson scarlet, extra large and fine, foliage very beautiful, habit dwarf, and free blooming. One of the finest scarlet Geraniums ever offered. 5s.

CERITO, salmon rose, truss and pip large. A novel and pleasing variety. Was exhibited at the National Floricultural Society, where the judges would have awarded it a first class certificate had the plant been exhibited. 5s.

PETUNIA.

SINGULARITY (Smith), a novel and striking variety, corolla two-thirds downward bright green, throat rose, flower extra large, the habit of Prince Albert, a pleasing variety. 5s.

Choice Verbena Seed, 2s. 6d. per packet.

A Priced and Descriptive Catalogue of first class Verbenas, Geraniums, Fuchsias, Hollyhocks, Dahlias, Chrysanthemums, and Petunias, will be forwarded in exchange for one stamp.

Tollington Nursery, Hornsey Road, Islington, London.

PELARGONIUMS, FUCHSIAS, PANSIES, VERBENAS, ETC.

JOHN DOBSON AND SON having a large and healthy stock of the above, beg to offer them at the low prices affixed; the plants are all in the finest health and require immediate repotting.

PELARGONIUMS, fine named varieties, 12*s.*, 21*s.*, 30*s.*, 42*s.*, and 63*s.* per dozen.

PANSIES, a first-rate collection, 6*s.*, 12*s.*, and 18*s.* per dozen.

FUCHSIAS, 12 fine varieties, including Vanguard, Queen of Hanover, Duchess of Lancaster, Glory, Duke of Wellington, &c., 18*s.* Older varieties, 9*s.* and 12*s.* per dozen.

VERBENAS, the best of last season's English and French varieties, 6*s.* and 9*s.* per dozen. A general descriptive Catalogue of the above may be had for one postage stamp.

Woodlands Nursery, Isleworth.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, begs to inform Gentlemen, Amateurs, &c., that he can supply them with the following, from a Stock of 20,000 Plants, well rooted, and in robust health, including every choice variety grown.

CARNATIONS, 9*s.*, 12*s.*, and 18*s.* per dozen pairs.
PICOTEES, 9*s.*, 12*s.*, and 18*s.* ,,
PINKS, 4*s.*, 6*s.*, and 9*s.* ,,
PANSIES, 4*s.*, 6*s.*, and 9*s.* per dozen plants.
BELGIAN DAISIES, 4*s.* and 6*s.* ,,
FLUKE KIDNEY POTATO, 5*s.* per bushel of 56 lbs.
SELECTED PANSY SEED, 1*s* and 2*s.* per packet.
DELPHINIUM BARLOWI, 4*s.* per dozen.
Auriculas, Alpine Auriculas, Polyanthuses, Primroses, &c.

Priced and Descriptive Catalogues now ready for one stamp. Post-office Orders to be payable at Middleton, Lancashire.

HORTICULTURAL GARDENS, NORWICH.

WILLIAM HUSSEY begs to offer the undernamed, in fine healthy plants:—

	per dozen.
GERANIUMS, all the finest show sorts	6*s.*, 9*s.*, and 12*s.*
Fancy do. do.	6*s.*, 9*s.*, and 12*s.*
SCARLET GERANIUMS	3*s.* to 4*s.*
FUCHSIA, all fine sorts	4*s.* to 6*s.*
CALCEOLARIAS, fine plants	6*s.*
VERBENAS, including all new ones of last year,	3*s.* to 4*s.*

W. H.'s Descriptive Catalogue may be had by forwarding one penny postage stamp.

SELECT CARNATIONS, PICOTEES, ETC.

CHARLES SCHOFIELD (late JOHN SCHOFIELD & SON) respectfully begs to offer for sale the following in strong healthy plants, viz.—12 pairs of Carnations for 8*s.*, 10*s.*, or 20*s.*; 12 ditto Picotees, for 6*s.*, 10*s.*, or 20*s.*; 12 ditto of Pinks, for 4*s.*, 6*s.*, or 12*s.*; 12 Plants of Pansies, for 4*s.*, 10*s.*, or 15*s.*; 12 ditto of Dahlias (in May), for 3*s.*, 10*s.*, or 20*s.*; 12 ditto of Scarlet Geraniums, for 6*s.* or 12*s.*; 12 ditto of Verbenas, for 4*s.* or 12*s.*

Also the following Seeds, selected from the choicest show flowers, Pansies, Calceolarias, and Hollyhocks, each per packet, 2*s.* 6*d.* or 1*s.* 6*d.* A Descriptive Catalogue of the above plants sent free on application inclosing one postage stamp.

Knowsthorpe, near Leeds, Yorkshire.

ROBERT M. STARK begs to intimate that his spring Catalogue of FLORISTS' FLOWERS, BEDDING, and select HERBACEOUS PLANTS (comprising every novelty of merit) is now ready, and may be had on application. Choice assortments of GARDEN, FARM, and FLOWER SEEDS, to which he has added several new and deserving varieties. Every other article connected with the Nursery and Seed Trade.

Edgehill Nursery; and 145, Princes Street, Edinburgh.—April 7.

SIR COLIN CAMPBELL CUCUMBER.—This is the finest Cucumber ever grown for exhibition, produce, and perfection. No grower should be without this unequalled variety. It is a splendid black spine, and always grows of an even length. Price 3*s.* 6*d.* per packet, containing five seeds.

GOLDEN DROP (Green Flesh Melon.)—One of the finest flavoured and most handsome Melons ever yet grown.

SCARLET KING.—This is a splendid Scarlet Flesh Melon of a very superb variety.

Each, price 1*s.* 6*d.* per packet; or a packet of the Cucumber with a packet of either of the Melons for 4*s.* 6*d.*, sent post free on receipt of penny stamps to the amount.

*** In answer to numerous inquiries for "TILEY'S CHAMPION KIDNEY POTATO," E. T. begs to state that he has about 5 bushels more to dispose of at 1*l.* per bushel, or 5*s.* 6*d.* per peck, hamper and package included.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

TO THE TRADE.—*The Subscribers can supply the following* AGRICULTURAL SEEDS *to the Trade. Prices on application.*

White Belgian Carrot.
Yellow Globe Mangold Wurzel.
Long Red ,, ,,
Skirving's Swede Turnip. ,,
Rendle's ,, ,,
True Devon Evergreen Grass.

Apply to WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

NEW ASHLEAF.—"THE CHAMPION."

JOSEPH WILSON, Ipswich, begs to state that his stock of CHAMPION ASHLEAF (decidedly the finest in cultivation), price 12*s.* per bushel (56), is getting low, and that early applications will be necessary.

J. W.'s stock also comprises the following excellent varieties:—The PROLIFIC KIDNEY, price 6*s.*; these on light land are a most profitable crop—they will repay a little outlay. MOSS KIDNEYS, 6*s.*; a similar variety to the Prolific, grow to a large size, but not so many to a root. SUFFOLK EARLY SHAWS, the finest in the world, 22*s.* per sack. LORD RAGLANS, a new mammoth variety, 42*s.* per sack (medium size cut); and the late variety, PINK KIDNEY, price 24*s.* per sack: for private growers this variety offers many inducements: its well known keeping qualities being as good in the month of May as when first taken up: and added to its immense yield, it possesses all the fine flavour of the Ashleaf.

Free to London for orders of 4 bushels and upwards. No charge for bags or sacks. No order attended to without a remittance.

OSAGE ORANGE (MACLURA AURANTIACA).

CHARLWOOD AND CUMMINS beg to announce that they have received from America Seeds of the above-named valuable Hedge Plant, which they are ready to send out at 4*s.* per lb., accompanied with directions for sowing and treatment, as described in the *Gardeners' Chronicle*, May 13th, 1854.

They have also received their annual importation of American Trees and Shrubs: Seeds, consisting of Azaleas, Rhododendrons, Quercus, Red Cedar, &c., of which a Priced List will be sent on application.

One-year Seedlings of the following varieties of American oaks, at 4*s.* per 100: Quercus nigra, Banisteri, alba, and obtusiloba. Fine Plants of Aquilegia glandulosa, 20*s.* per dozen. Delphinium giganteum, per 100 seeds, 20*s.*

SEED POTATOES.

Prices of all kinds of Agricultural Seeds will be found in RENDLE'S "Farming Price Current and Agricultural Directory," just published.—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

CHARLES TURNER begs to intimate that his New SPRING CATALOGUE is now ready, and contains descriptive lists of—

Dahlias,	Carnations,	Scarlet and Horse-shoe Geraniums,
Fancy Dahlias,	Picotees,	Delphiniums,
Cinerarias,	Pinks,	Mimulus,
Verbenas,	Pansies,	Pentstemons,
Fuchsias,	Auriculas,	Petunias,
Hollyhocks,	Shrubby Calceolarias,	Bedding Plants, &c.,
Chrysanthemums,		

including several new Dahlias, new Verbenas, new White Bedding Calceolarias, &c., offered for the first time. Can be had on application.—Royal Nursery, Slough.

TREES AND SHRUBS.—The annexed having been constantly removed are very suitable for immediate effect, having been grown more as single Specimens than Nursery Stock, and having formed large balls of earth. Every care is taken to ensure success.

Araucaria imbricata.	Deutzia gracilis.	Pinus Cembra.
Arborvitæ.	Holly, green.	,, insignis.
Azaleas, Ghent,	,, variegated.	Rhododendrons, best sorts.
Cedrus deodara.	Junipers in large variety.	,, hybrids.
,, Libani.	Picea Pinsapo.	Red Cedars 6 to 9 ft.
Chesnuts, scarlet.	,, Fraseri.	Portugal Laurels.
Cryptomeria japonica	Pinus excelsa.	Yew, Irish, 3 to 7 ft.

Also very fine Specimen Standard Portugal Laurels and Rhododendrons. Indian Azaleas and Greenhouse Rhododendrons, for which we received first prizes last year, are grown very extensively. Catalogues may be had on application; also the Tree and Shrub Catalogue.

H. LANE & SON, The Nurseries, Great Berkhamsted.

UNRIVALLED SPECIMENS OF HARDY ORNAMENTAL TREES, SHRUBS, CONIFERÆ, ETC.

LUCOMBE, PINCE, AND CO. respectfully call attention to their superior stock of the above, which is worthy of the notice of those who are engaged in Ornamental Planting where immediate effect combined with perfect safety in removal is an important consideration.

L., P. & Co. refer with much satisfaction to the great success with which they have for many years been in the habit of removing their large and symmetrically grown specimens (even to very great distances), facts which fully justify them in stating that such Plants as they now offer are seldom to be met with. Their stock is too extensive for the limits of an Advertisement, a few only of the more prominent ones being here named, but sizes, prices, and full particulars of all may be had on application.

Arbutus, of sorts	Laurels, *fine large, bushy*	Irish Yews
Abies Douglasi	Lucombe Oaks	Ilex Oak
,, orientalis	Magnolias	Japan Yews
,, Menziesi	Pampas Grass	Juniperus excelsa
,, canadensis	Pinus insignis	Libocedrus chilensis
Araucaria imbricata	,, austriaca	Scarlet Oaks
Biota glauca	Pinus cembra	Rhododendrons, *fine large, bushy, grown in loam, fit for any soil or situation*
,, japonica	,, excelsa	
Birch, silver stemmed	Picea Nordmanniana	
Cedars of Lebanon	,, Pinsapo	Standard Bays, *in tubs*
Cedrus deodara	Portugal Laurels, *fine large, bushy*	,, Portugal Laurel
Cupressus macrocarpa	Purple Beech	,, Standard Thorns
Ford's Oaks		&c. &c. &c.

Exeter Nursery, Exeter.—Established 1720.

R. PARKER begs to offer the following, all of which are well established, and can be forwarded to any part of the Kingdom:—

	From per dozen.—s. d.
Exotic Orchids, distinct and beautiful species	60 0
Exotic Ferns ,, ,, ...	18 0
British ditto ,, ,, ...	9 0
Exotic Lycopodiums ,, ,, ...	12 0
Roses, consisting of the best varieties of Hybrid Perpetuals, Teas, and Bourbons, strong plants, established in pots ...	12 0
Cinerarias, choice named varieties, strong, established plants, in 4-inch pots	9 0
Cinerarias (Seedlings), from the finest named varieties, including the best varieties sent out last season, strong, established plants, in 4-inch pots	4 0
Calceolarias (Seedlings), from beautiful spotted varieties, strong, established plants	6 0

Lists of Names forwarded upon application.

The following choice Cucumbers and Melons, in packets of 12 Seeds, at 1*s.* per packet:—

CUCUMBERS.	MELONS.
Superlative Improved	Golden Perfection (extra fine)
Walker's Rambler	Bromham Hall
Manchester Prize	Persian Green Flesh
Hunter's Prolific	Chichester Prize
Improved Patrick.	Cuthill's Scarlet Flesh.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Holloway.

BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety, also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Cytisus racemosus, Cineurarias in variety, Primula sinensis, Acacia armata, Deutzia gracilis, Erica Willmorea, &c. The Trade supplied.—Dulwich, Surrey, April 7.

TO PLANTERS.

HAY, SANGSTER, AND CO., have for sale the following:—600 to 700 strong Standard PEARS, 500 Dwarf do., and 100 Dwarf-trained do. Any reasonable offer will not be refused, as the ground must be cleared immediately.

Apply to HAY, SANGSTER, & Co., Newington Butts, London; of whom also may be had for seed York Regent Potatoes, 6*s.*, and Early American, 8*s.* per bushel of 56 lbs., the produce of their prepared Cuttings. Terms cash.

THOMAS BEACH, the well-known Strawberry Grower, begs to say that he has now ready a large stock of fine strong Plants of his TRUE BRITISH QUEEN, the same he beat the whole world with at the Crystal Palace, many weighing from 2 to 3 oz. each, likewise the same he gained the Knightian Medals with at Chiswick, and other places. He has gained the head prize, and surprised the world, both in flavour and weight. Strong Plants sent to any part of the world, at 5*s.* per 100, box included.

Post-office Orders on Hounslow, to Mr. THOMAS BEACH, Strawberry Grounds, Worton, Isleworth, Middlesex.—April 7.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

BEAUTIFUL FLOWERS.—Twelve packets, each packet containing 100 Seeds, 1*s.*; sent free per post, 1*s.* 2*d.* Abronia umbellata, Eccremocarpus scaber, choice Gloxinias, Lophospermum Hendersoni, Lisianthus Russellianus, and every other choice variety 6*d.* per packet. Dwarf German (10 week) Stocks, as imported, 36 varieties, each variety 3*d.* per packet.—WM. CULLINGFORD, 1, Edmund Terrace, Ball's Pond, Islington, London.

AUSTRALIAN KIDNEY VICTORIA KIDNEY, and EARLY PROLIFIC POTATOES, 8*s.* per bushel.

SPRING FLOWERS.—CINERARIAS, good flowering Seedling Plants, 4*s.* to 6*s.* per doz.; fine named varieties, 6*s.* to 9*s.*

HYACINTHS in pots, various colours, just showing bloom, 4*s.* per doz.; also a few very fine named flowers, many of which are catalogued at 1*s.* to 1*s.* 6*d.* each, in the same state as the above, 9*s.* per doz.

FINE HERBACEOUS CALCEOLARIAS, from Major's seed, in large and small 60 pots, 4*s.* to 6*s.* per doz.

WOOD and INGRAM, Nurseries, Huntingdon.

DWARF FRENCH BEANS can be had in any quantity.—Apply to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

PLANT YOUR POTATOES WITH JACKSON'S PATENT PREPARATION.

BASS AND BROWN having been appointed Agents for the above, will be happy to furnish it to their customers who may be forwarding their orders for Potatoes or other goods. Also Agents for PAGE'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT.—Sudbury, Suffolk.

PAGE AND CO.'S BLIGHT COMPOSITION.—Extra Strong, 4*s.* per gallon, sufficient to make four (Jars and Barrels extra); in Bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. Directions for application forwarded. 10 Gallons and upwards Carriage Free to London. Should be in the hands of all Plant and Fruit Growers. See *Gardeners' Chronicle*, March 3, 1855. It can now be obtained of

Messrs. F. & A. Dickson & Sons, 106, Eastgate Street, Chester, and 14, Corporation Street, Manchester	Mr. Burham, Hastings
Bass & Brown, Sudbury	Messrs. Chandler & Son, Wandsworth Road, London

,, W. Barratt, St. John's, Wakefield.	
,, Baskerville, Bristol	

and of the Inventors and Manufacturers—

B. PAGE & Co., SEED MERCHANTS, Oxford Street, and Above Bar, Southampton.

N.B.—Other names will shortly appear, as the agents are appointed.

The Gardeners' Chronicle.

SATURDAY, APRIL 7, 1855.

THE war with Russia has already doubled the price of garden mats, and will, probably, destroy the trade altogether. Should this prove to be the case gardeners, the great consumers of Russia mats, must find a substitute, for BAST is necessary to their business. Already a substance called Cuba bast has found its way into the market; but it is too weak and too dear. At the last meeting of the Horticultural Society, Messrs. PAUL, of Cheshunt, exhibited samples of a better material, for it was softer and stronger, which we understand can be supplied at a much lower rate; and this appears to be the best substance of the kind at present on sale.

But at the same meeting were exhibited by Dr. ROYLE other basts, from the East Indies, incomparably stronger than either of the preceding. They came from Arracan, where they appear to bear the common name of *Shaw*. All tropical damp

countries in fact abound in trees whose inner bark can be peeled into such strips as Russia mats are made from, and if such as have hitherto been most heard of come chiefly from India, it is only because we know more of the non-commercial products of the old than of the new world, thanks to the experiments and inquiries continually making by the officers of the East India Company, and most especially of late years by Dr. Royle. There can be no doubt that an article of the same class as the Russian mat, and of far better quality, can be manufactured in India from the basts that are procurable in all directions. The only difficulty would be the cost of freight. Whether it could be brought in Europe into competition with the very indifferent Russian mat, we are unable to say; but there can be no doubt that were that possible, there would be a ready sale for such a production, at even a higher price, provided strength and durability were increased in proportion. Merchants alone know whether such an import could come profitably as dunnage, and therefore at little cost, and to them must be left the solution of the question.

It must not, however, be supposed that this is a matter interesting only to us English; it is in reality a great colonial question, for we find that Russia exports about three millions and a half of mats annually, of which from 300,000 to 800,000 are consumed in the United Kingdom. Nothing produced naturally in this country can be converted into such an article. We have of late been forced into the use of the light woollen canvas called *Frigi domo*, but the quality of that article is already so deteriorated that it will probably soon cease to be in demand, and then we shall feel the want of mats more than ever. It is possible, indeed, to manufacture our own straw mats, and for winter covering they are excellent; but they are too opaque for shading, and give the gardener no aid when he looks round for something inexpensive with which he can tie up his trees or his produce. Mats, therefore, may be considered indispensable horticultural implements, and we earnestly hope that either our East Indian or West Indian possessions will find us a good substitute.

—The roots of a variety of plants are subject to excrescences of different size, form, and character. Some of these, as in Leguminosæ and Conifers, are more modifications of the branchlets of the roots themselves, and are either normal or due to peculiar circumstances in which the plant may be placed. In the former case they are probably reservoirs of nutriment, in the latter from their abundant reticulated cells, homologous with those of the aerial roots of Orchids, there can be no doubt that they perform some important economical function. There are, however, many other tumours which are evidently of insect origin, and some which are mere hypertrophies, or whose nature is still doubtful. Some of these so closely resemble fungi that they have been placed by Fries in his genus Mylitta, and we have one now before us, in which such a curious resemblance occurs to the fructification of some smooth-seeded Truffle that a youg botanist might almost be excused were he to fall into error. Amongst a quantity of Cucumber plants in the garden at Nuneham, Mr. Baily observed, a few days since, one whose leaves were covered with brown spots, some of which occurred also on the stem. The frame was slightly affected with Thrips, but there was no circumstance to account for the unhealthy state of this individual plant, and on closer examination the root was found to be covered with excrescences varying from the size of a small pin's head to that of a little Bean or Nutmeg. The roots of Melons, Gourds, and many allied Cucurbits, have a peculiar odour when healthy, resembling very closely that of the pith of the common Rush; but in this case there was a hot acrid smell, like that which is so common in Crucifers.

The tubercles were of a dirty cream colour, nearly globose, obscurely furfuraceous, and in almost every case were developed on one side of the root, as was very evident in the younger individuals; but the same fact might be traced even in the largest. A section exhibited irregular, radiating, whitish, and sometimes snow white masses of vascular tissue with numerous large open ducts intercepted by loose cellular tissue, simulating in arrangement medullary rays, and passing gradually into a thick external ring of parenchymatous cells, especially on the side of the tubercle where the swelling had first taken place. On a minute examination of the tissues the first point worthy of remark was the enormous development of the vascular tissue, and a second that many of the ducts, both in the tubercles and the unaffected portions of the roots, were traversed apparently by multitudes of threads. It was a question, therefore, whether the morbid bodies might not be due to the mycelium of some fungus. Few points, however, are more difficult to ascertain with certainty than the real nature of such appearances. It is extremely easy to confound sections of cells with mycelium, and such mistakes are often made. After long examination we were, however, convinced that there was no mycelium,* and the application of chemical tests was conclusive as to the point, since the connecting membranes became visible, and the supposed threads acquired a deep blue tint when treated with iodine and sulphuric acid; and it was evident that a growth of loose cells had taken place within the ducts, probably for the ultimate deposition of fecula, as in some Leguminosæ. Our attention had, however, been drawn to certain little cyst-like bodies, much larger than

the mouths of the ducts, which were themselves of considerable size, and to our great surprise it appeared that these cysts were regular membranous sacs, exactly resembling the sporangia of Truffles, and filled with a multitude of minute elliptic or slightly cymbiform eggs, averaging not more than $\frac{1}{550}$th† of an inch in length, with a breadth of $\frac{1}{300}$. In many of these the nucleus already showed the form of a Vibrio, folded up once or twice, and several of the animals were free, though still of small size, having escaped from the eggs by a little circular aperture at one

extremity. The cyst was destitute of any evident organic structure, was not affected by iodine and sulphuric acid, but showed some appearance of giving way under caustic potash. It was clear, then, that it did not consist of cellulose, but might possibly be some modification of xylogen. It is not conceivable that such a cyst could have been deposited by the Vibrio itself, and we must therefore consider it as due to the irritation caused by the presence of the eggs, and exactly analogous to the cysts produced by the larvæ of the cestoid worms in animal structures. We are not aware that anything of the kind has ever been observed before in vegetable parasites; for though the tissues of vegetables are greatly altered by the presence of the larvæ which produce galls, it does not appear that they ever give rise to a free cyst, as in the present case, differing altogether from the surrounding tissues. In immediate contact with the cyst was a most delicate tissue of spiral or reticulated cells, probably in a young state, the structure of which was only visible under very high powers. There is every reason to believe that the anomalous condition of the roots was due to the presence of the Vibrio, the extreme minuteness of which makes it very improbable that any remedy could be suggested were the evil such as to require one. The Vibrio was not seen except in a very young state; any attempt, therefore, to ascertain the species, supposing it to be described, is hopeless.

The articulated appearance, after the fashion of Cephaëlis, often assumed by Melon roots, may possibly arise from some similar cause. We shall hope on some future occasion to examine the phenomenon.

We have represented in the annexed figures the general appearance of the production, of the natural size, omitting, however, for the sake of distinctness many of the nodules; a section through one of the cysts with the surrounding tissue magnified; a portion of the eggs and the young Vibrios themselves, as seen when treated with iodine and sulphuric acid; and also a portion of the delicate tissue above mentioned more highly magnified. It should be observed that this latter presents very different appearances in different parts; in some, the outlines of the cells are as represented in the figures, in others the tips of the cells are sharply pointed; and while the generality of them merely exhibit transverse lines, as from a spiral thread, some of them are delicately reticulated. *M. J. B.*

* Threads of mycelium rarely, if ever, turn blue on the application of iodine and sulphuric acid. If perfectly free from nitrogenous matter they will do so. Every doubtful case should therefore be submitted to chemical verification.

† These are, however, large in comparison with those of the common human thread-worm, whose dimensions are $\frac{1}{400}$ by $\frac{1}{320}$.

The following announcements appeared the other day in the *Globe*:—"We have reason to believe that the Hon. James Kenneth Howard will succeed Mr. T. F. Kennedy in the office of Commissioner of Woods and Forests. We have much satisfaction in stating that Sir John Herschel will be succeeded as Master of the Mint by the distinguished Professor Graham, of University College, now one of the Assayers."

The latter of these appointments does great honour to Lord Palmerston. A man more highly qualified than Mr. Graham for the important post to which he has been advanced could not have been selected. As a profound chemist he is intimately acquainted with the great processes over which he is now to preside, and the public service cannot but derive all the advantages which scientific refinement, combined with practical experience, can bring with it to so vast a subject as our coinage. In short Professor Graham is a worthy successor to Sir John Herschel; and the appointment is the more to be applauded that it was made without the aid of political influence.

But what are we to say of the other nomination? The officer under whom the management of the Royal Forests is placed should have attainments of a high order as well as the Master of the Mint. Unless he is conversant with the science of forestry, the working of mines, and a variety of other matters of the first consequence in rural economy, to say nothing of the control of landed property, he does not possess the qualifications indispensable in so peculiar a charge. Is the Honourable James Kenneth Howard a master of these branches of knowledge? We are not the only persons unable to answer that question; for we observe that Mr. Craufurd has given notice in the House of Commons of his intention, after the recess, to call the attention of Parliament to the appointment in question. As far as we are at present informed we can only say that Mr. Howard is son of the Earl of Suffolk, son-in-law of the Marquis of Lansdowne, and brother-in-law of Lord Shelburne, and of the Honourable Charles Gore, the other Commissioner of Woods and Forests. All therefore which is certain is, that he enjoys the advantage of high connections. Let us hope that the honourable gentleman is equally provided with the greater requisites of his office.

VEGETABLE PATHOLOGY.—LXVI.

289. Variegatio.—Phænogamous plants, with few exceptions, in a state of health, and duly exposed to the influence of light, exhibit in their leaves and often in other organs a green tint of greater or less density according to the individual species. This depends upon a peculiar substance called chlorophyll, capable of various modifications as regards colour, and incorporated in some way not perfectly ascertained at present with certain, for the most part, nitrogenous globules, which do not, however, seem to consist entirely of chlorophyll, but to be a mere receptacle for it. These globules are indeed intimately connected with its production, as they do not seem to exist in cells which are perfectly colourless.

290. Chlorophyll seems to differ in quality in different plants; that of Lichens at least is not identical with that of Phænogams. The globules moreover which serve as

its receptacle are not always of the same nature. In Lichens they are probably reproductive; in some Algæ they are certainly capable of germination, while in Phænogams, notwithstanding the attributes assigned by Turpin to his globuline, there is no proof that they are capable of giving rise to organised structures, except by chemical decomposition. In Phænogams such globules are dispersed irregularly in the protoplasm of the cells, while in Chara, Zygnema, &c., they have a definite arrangement, which in the former instance cannot be deranged without the destruction of the circulation and other vital phenomena. In most instances the globules arise indifferently in the midst of the protoplasm; but in Lichens they are produced at the tips of threads, of which they are the ultimate articulations, after the manner of spores.

291. According to the various modifications which chlorophyll undergoes, different tints are assumed in various parts of a plant, and not only do flowers exhibit their multiplicity of hues, but even leaves in their normal condition are variously painted. With such matters, as peculiar to each species, and consistent with perfect health and the performance of every vital function, however interesting, we have nothing to do in this place. In certain cases, however, either in every cell equally, as in seedlings, or in portions only, variously disposed, the chlorophyll, though in the normal condition produced abundantly, is entirely wanting. The seedlings are of very short duration, seldom advancing beyond the development of the cotyledons; the partially affected plants are of indefinite duration, and are known under the name of variegated.

292. If the leaf of a plant, as for instance of a variegated Pelargonium, be examined under the microscope, while the green portions are rich in chlorophyll, the blanched parts are entirely destitute, except in those varieties in which the border exhibits a golden or speckled appearance, which is dependent on modifications of the contents of the cells. In proportion as the cells are coloured, the globules, which are the receptacles of the chlorophyll, are more or less developed, and of greater or less size. The functions of the cells in other respects are not impeded, there is no lesion of their walls; the bleached parts are not killed by exposure, as is the case with some delicate pale tissues, as, for instance, the expanding fronds of certain Ferns; and if there were no other peculiar phenomena, plants so affected could be regarded only as mere varieties, and not as plants in a diseased condition. It is, however, curious that when a portion of a plant with variegated leaves is in communication with other parts which normally would produce leaves endowed with the ordinary green tint, those parts are liable to contract the affection; and the affection, when once present, does not seem to vanish altogether, though it is said that in some cases it may be modified by rich soil, accompanied by complete exposure to light. It is possible, however, that variegation may not always be properly distinguished from Chlorosis.*

293. Variegation may arise either in the seedling,† or in some particular branchlet of a tree; often in shoots coming from adventitious buds. Such a shoot may communicate the affection immediately, or if grafted upon a sound stock may affect the stock; or, on the contrary, if the stock be variegated the graft may be affected. Many such instances are reported in the older writers on Horticulture and Vegetable Physiology, and in more recent times Turpin, in his memoir‡ on grafting, informs us that Noisette had observed the phenomenon in the case of a variegated Jasmin. Seedlings, however, from variegated plants are not of necessity variegated, exactly as the produce of an Albino does not necessarily exhibit the peculiarities of that animal condition.

294. Many plants in their normal condition exhibit parts which are entirely colourless, though modifications of organs which in their normal condition are green. It does not however follow that such plants are in precisely the same state as the colourless parts of variegated leaves. White flowers, for instance, seem to have their own peculiarities. They are by no means free from colouring matter, and in some instances they give the same chemical results as flowers of a different colour.§

295. It appears, on the whole, that variegation depends originally upon a weak condition, but if so, one which does not admit of perfect remedy, and which, moreover, is capable of propagation. It should seem, however, that this capability exists only for cells in a young and tender condition. A leaf which is already green does not lose its chlorophyll, nor are neighbouring cells affected; it is only in new shoots or leaves that the extension of the malady is visible. In fact, cells of the most different colours may be in juxtaposition without any mutual effect, as regards colouring only. *M. J. B.*

* A case is quoted by Meyen from Burgsdorf's "Versuch einer vollständigen Geschichte vorzüglicher Holzarten," a book to which I have not access, which is worthy of attention. A young Beech which had been eaten down by snails to its cotyledons, and in its first winter by deer, produced in the spring two leaves only, with but little green about them. It was transplanted the next year into better soil, and again produced variegated leaves: after it was established the white spots gradually disappeared, and at length there were no signs of variegation. It is said also that variegated Myrtles recover their green tint when so treated; and it is notorious that even in variegated trees particular shoots will reappear in their normal condition. The curious point is, that if the malady arises in the first instance from any external cause, it should so seldom disappear, and that it should be so easily and permanently propagated.

† Knight obtained variegated plants of Vines by crossing.

§ See Thomson's "Organic Chemistry," p. 427.

CLIMATE OF FOREIGN COUNTRIES.—No. VI.

NICE, 30 *March*, 1855.—On the 10th of this month single red Tulips (Oculus solis) were in flower in the cornfields. On the 13th white Thorns were in full leaf. On the 15th were gathered wild the double Scarlet Anemone (Regina), which is also abundant in gardens. Some of the Lemon and Orange trees were also in blossom in the warmer situations. On the 22d, Peaches and Nectarines (all standards here), and new Cherries, Pear trees, and Plums were fully out—Apples, partially. Asparagus from gardens, and also *wild from the hedges*, is sold in the market. On the rocks of Mount Vinaigrier, the Asplenium Petrarchæ (a Fern not known in Britain) something like A. trichomanes, but much prettier, grows rather plentifully. China Roses are coming into flower. Lycopodium denticulatum grows in the lanes and valleys. Manure here has great care taken of it; a great part is *liquefied* and in that state applied round the roots of the Orange and Olive trees. *No sewage is allowed to escape.* The recent decrease in temperature appears to have been almost simultaneous in London, Paris, and Brussels, and of about the same extent. The usual cold March winds have been but little felt here at present.

E. C.

Villa Reale, Naples, March 28th, 1855.—Trees coming into leaf: Maple, Fig, Lime, Beech, Hornbeam, and Acacia, and in sunny places the Vine; except one Maple in full leaf, all the rest seem equally advanced. The flowers are "legion:" Judas trees, of which there are only three in this garden, Glycine, Azaleas, Roses,—amongst the rest Devoniensis and the dark China—Tulips, Ranunculuses, Hyacinths, the Grape Hyacinth, and Anemones, we met with a month ago in Tuscany; Calla Æthiopica, in full flower, planted in rock-work islands round a fountain; Geranium (Scarlet) Mallow, 8 feet high; Stocks of all sorts, very poor; the chief weed under the trees is a yellow Oxalis. The Mesembryanthemum hangs like Ivy in masses 6 feet long from the top of walls; its triangular leaves are half an inch each side of the triangle. The Cytisus and even the Laurustinus and Magnolia have the edges of their leaves browned by the frost; the Laburnum in full leaf will, in two or three days, be in flower; the Aloe and Iris (common blue) grow on the ruined walls, and Ivy quite as thick as with us. At Florence beyond the Olives and Oleanders no one thing existed to remind one of the south, the only Ferns were the Ceterach and Asplenium nigrum and Trichomanes; here the true Adiantum cap. Veneris covers the lava round the fountains. The Filix-mas grows from the tufa walls, and is now a foot high. The Grass borders here are cut with a hook! and every plant of Clover is eradicated. The China Roses, Azaleas, and Camellias have each a hole 2 feet in diameter round them. In Lady Strong's villa, across the street, there is an Araucaria excelsa, about 15 feet high, worth coming to Naples to see. The Lupins and Trifolium incarnatum are in flower in the fields. The want of any freestone, and the excellence of the clay, cause terra-cotta vases of beautiful forms to be universally used here, even in the King's gardens. The beautiful yellow red to which this clay turns in the fire agrees much better with the green leaves than either stone or marble, and I am much surprised that our friends never think of sending any over to England. They have the bad taste here to put white marble seats on rough bases of small lava and scoriæ, and make their statues rest on similarly made islands, from holes in which lava issue two jets of water. The Palms are not allowed fair play, but "overcrowed" by dozens of other trees, consequently they are not very fine. There are no small Tangerine Oranges in the Villa Reale, but at two or three villas at Pausilippo there are a few. Vesuvius has much snow on it yet. At 5 o'clock a common bat was hawking after flies in broad daylight here amongst the promenaders. *Somerset.*

THE DISMISSAL OF THE RIGHT HON. T. F. KENNEDY.

WHEN Sir John Shelley withdrew his motion in the House of Commons on the 27th of February, for a Committee to inquire into the grounds and justification of the removal of Mr. Kennedy from the office of Commissioner of Woods, &c., he did so on the condition of an express undertaking, by the Prime Minister, being also first Lord of the Treasury, in the face of the House of Commons, that certain words, contained in a Treasury Minute of the 31st March, 1854, offensive to Mr. Kennedy and his friends, should be *officially* retracted by the Treasury, and that such retractation should be *officially* recorded at the Treasury.

This pledge has been amply and promptly fulfilled by the First Lord of the Treasury.

A Parliamentary Paper has recently been printed (No. 141) containing a letter addressed, by command of the Lords Commissioners of her Majesty's Treasury, to Mr. Kennedy, together with a Treasury Minute *made in pursuance of the undertaking of the Prime Minister.* This Minute contains a letter from Mr. Gladstone, dated 28th February, the debate having taken place on the 27th. It may be worth while to place in juxtaposition the offensive paragraph and the Minute made in pursuance of the undertaking of the Prime Minister:

Extract from Minute of Treasury, March 31, 1854.—"In the case, however, of the controversy which has "arisen between Mr. Higginbothom and Mr. Brown, "and *also* between the former gentleman and *Mr.* "*Kennedy* on the subject of Mr. Brown's reports on "Alice Holt and Woolmer Forests, the questions "at issue are reduced to matters of simple fact, "but which, from the spirit in which the discussion "has been conducted, have assumed a character in-"volving the veracity, integrity, and honour of the "parties, and rendering it desirable, on that account, "that the matter should be brought to a conclusion with "the least possible delay."

"COPY OF TREASURY MINUTE, DATED MARCH 2, 1855.

"My lords read the following letter from the Right Hon. W. E. Gladstone:—

"'Downing Street, Feb. 28.

"'My Lords,—In a discussion which arose last night in the House of Commons, with respect to the case of Mr. Kennedy, it was stated by Sir John Shelley, who made a motion on his behalf, that his removal from office had taken place in conjunction with reflections on his honour, veracity, and integrity. Having been the person principally responsible, as Chancellor of the Exchequer at the time, for Mr. Kennedy's removal, I may take this opportunity of stating, what, however, I know to be perfectly familiar to your lordships, namely, that *no imputation was cast* or was intended to be cast *by me upon Mr. Kennedy* in respect of his honour, veracity, or integrity; on the contrary, I had a sincere respect for the zeal with which he appeared to prosecute his duties; and his character, after a long life, was unassailable in these vital points. I am able to state that in all communications which have passed between the Earl of Aberdeen or myself on the one hand, and friends of Mr. Kennedy on the other, the utmost willingness has at all times been expressed by us both to adopt any effectual and proper mode of placing this matter, naturally so interesting to Mr. Kennedy, beyond doubt. As, however, I must judge from the language used last night by Sir John Shelley, and likewise by other members of Parliament, that such doubt has existed, and as it appears to be in some degree supported by words in a Treasury minute, which were used, I am well assured, with another intention, I venture to suggest it to your lordships for consideration, whether you might not act justly by Mr. Kennedy were you to place it upon record in a supplemental minute that it has never at any time been *intended to cast any reflection upon Mr. Kennedy in point of honour, veracity, or integrity.* I have, &c.,

"'W. E. GLADSTONE.'

"Mr. Wilson states to the Board that, being fully cognizant of the intentions of their lordships' immediate predecessors, he is enabled to assure their lordships that the expressions in a minute of the Board to which Mr. Gladstone refers, and which have been interpreted by Mr. Kennedy and his friends as throwing an imputation upon the honour, veracity, and integrity of that gentleman, *were not intended to have such an application*, or in any way to impeach his honour. My lords desire that a copy of this minute be communicated to Mr. Kennedy, with the expression of their lordships' hope that it will have the effect of relieving his mind from any feeling that his honour has been called in question."

"Thus," as is remarked in a paper in private circulation, "it appears that Mr. Gladstone on the 28th of February, 1855, '*suggested*' to the Lords Commissioners of the Treasury, for their consideration, a course of proceeding ('acting justly,' as he says, 'by Mr. Kennedy') which the Prime Minister had on the *previous day*, the 27th, pledged himself to the House of Commons to adopt. It appears that Mr. Gladstone thought this proceeding proper to be adopted, on considerations of justice and truth, but he waited for upwards of nine months before he took it, or 'suggested it for consideration,' and until it was extorted by a motion in the House of Commons. He claims credit for doing that in which the Prime Minister had anticipated him, and had pledged himself to do, before he had the benefit of Mr. Gladstone's suggestions." This, it would seem, is Mr. Gladstone's perception and sense of justice, and the manner in which he carries them into execution. May we ask in what school he gained his own ideas of right and wrong; at Naples? or in Whitehall?

With reference to the last remark, we beg the attention of our readers to the words here printed in italics. After giving it they may perhaps arrive at a better judgment concerning the true value of the statements occasionally made by public men, than they could previously form. It is clear that what Messrs. Gladstone and Wilson really say is not to be taken as an expression of what they intend or mean, but that they belong to that ingenious school which takes for its motto, "The use of words is to conceal meaning."

Lord Palmerston, in thus forcing his ex-colleague to sing his palinode, has fully redeemed his promise to the House of Commons. "But," as a contemporary has well put it, "though Mr. Kennedy was dismissed from the Woods and Forests, yet a Minute is entered on the records of the Treasury praising Mr. Kennedy to the skies. The only inference one can draw from this, and many similar instances, is, that under our matchless constitution men are turned out of their offices because they have deserved well of their country. It would seem to follow, that for a man to be left in office is tantamount to a declaration that he is incapable or

untrustworthy." However unjust such an inference manifestly is in numerous cases, we must confess that the conduct of the Woods and Forests renders the conclusion inevitable in that department of the public service.

COMMON THINGS.

Shallots.—The usual method of cultivating these is to plant the roots in drills, and to earth them up as the plants advance in height; but the late Mr. Knight suggested a mode of surface-planting by which he states he succeeded in growing very fine bulbs. It is thus described:—He placed a rich soil beneath the bulbs, and raised the mould on each side, to support them till they became firmly rooted. This mould is then removed by the hoe, and watered from the rose of a watering-pot; and the bulbs in consequence were placed wholly out of the ground. "The growth of these plants," he added, "now so closely resembled that of the common Onion as not to be readily distinguished from it till the irregularity of form resulting from the numerous germs within each bulb became conspicuous. The forms of the bulbs, however, remained permanently different from any ever seen of the same species, being much more broad and less long, and the crop was so much better in quality, as well as much more abundant, that the mode of culture adopted is confidently recommended to every cultivator.

Tomatoes.—The seeds of these should now be sown upon a hot-bed, and as soon as the plants are 2 inches high they should be planted in small sized pots, placing two plants in each pot. They should have plenty of air allowed them so that they may not draw up weakly, and about the end of the month they may be removed to a cool frame, and hardened off by degrees till they will bear the open air. In May, or the beginning of June, they may be planted against a south wall. They must be trained close to the wall as they grow, and when they have acquired sufficient length and shown blossom enough for a crop they should then be topped and all useless laterals removed as well as those leaves which shade the fruit. The common large red kind is the most useful for ordinary purposes.

Home Correspondence.

Restoration to Health of a decayed Holly.—Some years ago a beautiful, old, spreading Holly tree showed signs of decay. It grew in a cultivated field; the roots of the Couch-grass, which were in the field, were collected, and instead of carting them to an out-of-the way corner, they were spread in large quantities under the Holly tree; the fresh soil attached to the roots of the grass, and the decomposition of the roots themselves, have greatly benefited the Holly, which is now in a healthy condition. It will thus be seen that the years of many a favourite tree may often be prolonged by very simple means. *P. M.*

May's Magnum Bonum, alias Bedale Hall Cos Lettuce.—Mr. Fitzsimon is wrong in stating that this variety was raised by Mr. M'Donald; that it was called M'Donald's Cos is true, but this name, as well as that of Bedale Hall Cos, were given it merely because its proper name had not been ascertained. In the first place Mr. M'Donald gave a few plants or seeds of this Lettuce to my father, declaring that he could not "shank" it, and that he would give him a sovereign for every seed; my father, however, succeeded in seeding it, and gave a few seeds to one or two neighbouring gardeners, along with his method of producing them, and in this way the variety has been preserved. Mr. M'Donald also declared that it was only possessed by himself and a friend; that it was not in the trade, but refused to give its name (if it had one) or its origin. I have endeavoured to discover its right name, both from London and country travellers, but without success. If it can be proved what it really is in the garden of the Horticultural Society it will be a pleasure to myself and a benefit to the public, as it is deserving of general cultivation. Mr. M'Donald, I have been informed, went to America a few years ago. *C. Hewson, Bedale Hall, Yorkshire.*

Pruning Knives.—An inquirer after a good pruning knife may buy the best I ever had of Beach, of Salisbury. They are mounted in wood and particularly well shaped. I direct to him, Mr. Beach, King of the Cutlers, Salisbury, and have had dozens of him. *Woglog.*——I could readily explain why these are not good at the present day. Suffice it to say that our manufacturers generally have acquisitiveness rather too fully developed; but there are yet remaining a few men devoted to their callings, and who feel the greatest amount of gratification when they have served their customers well. One of these is Mr. Williams, Butchers' Cutler, 14, West Smithfield, and if your correspondents will be satisfied with a plain knife (not a clasp), they may there procure as good a one as ever was put into a bush; and if they would more certainly assure themselves of this fact, let them inquire at any butcher's shop in London. *Francis Parkes, Steel Digging-fork maker, Sutton Coldfield.*

Dead Vines.—Last week I called on a neighbour who has two vineries; one he uses as a greenhouse, the other during the winter months is a plant-stove. In the former the Vines have been planted 3 years last autumn, and in the latter two years. The borders were made over-rich, being fully half manure, with insufficient drainage, the subsoil being stiff clay. During the two first years the Vines grew luxuriantly; but in the beginning of December, 1853, they were turned out of the house before the wood was thoroughly ripened, and exposed to the severity of the weather until the following March, 1854. They broke but indifferently last summer, owing doubtless to their being so much exposed; this season every Vine has died to within 3 feet of the ground. On examination it was found that the roots had entered the stiff clay. Now what was the cause of this failure? Their being exposed in an unripened state, or was the disaster occasioned through the roots entering the cold clay? All the Vines were planted outside the houses. Most of them in the other house have been planted two years, but I believe three were planted this spring; they have all been turned out of the house during the winter, with a few haybands twisted round them; they have nearly all shared the same fate as those alluded to above—in short, they are all dead to within 2 or 3 feet from the ground. *E. B.* [Of course. If you manure Vines extravagantly they cannot ripen their wood, and frost must kill them.]

The Weather in Stirlingshire—"Borrowing days."—There are some old popular rhymes about the "borrowing days," such as—

"March borrowit fra Aperill,
Three days and they were ill."

Also the following—

"March said to Aperill,
'I see three hogs upon a hill;
But lend your three first days to me
And I'll be bound to gar them die.
The first it shall be wind and weet,
The next it shall be snaw and sleet,
The third it shall be sic a freeze,
Sall gar the birds stick to the trees;'
But when the borrowed days were gane,
The three silly hogs came hirplin hame."

This season winter has borrowed a month or two from spring which will be long remembered by the cultivators of the soil. In the last week of March the frost and snow in some places in the neighbourhood of Stirling prevented the spade and the plough from working freely, and the effect of 30° of frost is still visible in many places upon garden vegetables and shrubs; some are dead and their remains bleached white, others will require a good cutting in to remove the withered appearance, and yet some shrubs of the same species appear to be little injured by the severe frost, which almost killed their near relations. Our common spring bulbous flowers are long in coming, but they are welcome, although they are "hirplin hame" at a slow rate. The severe frost has also tested the hardiness of some of our newly introduced plants; for instance the Dielytra spectabilis, which will bloom in our stoves and greenhouses, will also live at zero of Fahrenheit's scale. *P. Mackenzie, West Plean, Stirling.*

Origin of the name Hypericum.—Few plants have had such a run of popular names as this genus. Gerard is loud in its praises, and says "a most pretious ointment" is made from it, hence probably its name in our time of "Tutsan" (*toute saine*, all heal). "Aaron's beard" and "terrestrial sun" relate no doubt to its starry flowers, for not only are its petals of a bright golden yellow, but it has a host of yellow stamens slightly tinged with red occupying the whole disc of the flower, and forming half a globe; but, besides the golden hues of its petals and stamens, it has a multitude of pores in its leaves—hence the French writers call it the flower of a thousand holes (*mille pertuis*). These names are therefore all easily accounted for; but I was not a little surprised to find in Loudon's "Hortus Britannicus" that the botanical name of this genus (Hypericum) was stated to be of "origin unknown." On referring, however, to Loudon's great work, the "Arboretum et Fruticetum Britannicum," I find various conjectures offered as to the origin of this very ancient name, not one of which appears even to be in the least plausible; and it were vain to look among modern words for a name compounded, for aught we know, hundreds of years before the Christian era, since the name Hypericum is given in the works of Dioscorides. Hypericums are all of the easiest culture, and by nature widely spread both as beautiful plants and as weeds; we might therefore, with good reason, look for the name occurring as a household word along with such as the Lily and the Rose, and following like them in the wake of civilisation and Christianity. Bearing as it does in our own language, as well as in that of Germany, the name of one of the Holy Family, the beloved St. John, it is easy to see that its virtues were accounted by the early Christians as of the highest order; and added to this its ancient name "Androsæmum" literally signifying human blood, from aner (andros), a man, and haima, blood, in allusion to the dash of red on its stems, [We rather believe this name refers to the property undoubtedly possessed by the Androsæmum of staunching blood; it is, in fact, an ancient vulnerary.] as well as on the golden rays of its long slender stamens, we can readily comprehend that bright ideas were associated with this terrestrial sun in those early days. Now in all figures of the Holy Family, ancient and modern, the rays of light encircle not only the head of our Lord and Saviour, but likewise the heads of the blessed Virgin and St. John, and as the precursor of the Messiah was the foremost ray of the world's light (terrestrial sun), we can easily see the link that connected the St. John's Wort with the glory on the figure, for this is literally the Greek compound of this ancient and beautiful name from huper, upon, and icon, the figure. Hence we have the classic origin of Hypericum simplified, and in harmony with its ancient line. *Alex. Forsyth.*

Beneficial Results of Planting Evergreens in Peat.—The following statement may be useful to those who may yet plant evergreens, for shelter or ornament, where peat can be easily obtained. Upwards of [illegible] years ago some Portugal Laurels were planted in a mixture of peat earth and common earth. Others in common soil, only a few feet apart from each other with the same aspect to each. Some of those in the peat measure 25 feet in diameter and 18 feet in height, and are still in a healthy vigorous state with scarcely a leaf injured by the frost of last winter; the best of the others measure 14 feet in diameter and 10 feet in height, and they have many brown leaves upon them. *P. M.*

Societies.

HORTICULTURAL, *April* 3.—Sir Philip de Malpas Grey Egerton, Bart., M.P., in the chair. Lieut.-Col. Crabbe, K.H.; T. B. Simpson, Esq.; J. H. Hedge, Esq.; and C. Fletcher, Esq., were elected Fellows. This second spring meeting, notwithstanding the peculiar backwardness of the season, was the occasion of bringing together a very interesting exhibition of flowers, fruit, and vegetables, and a very crowded attendance of Fellows and their friends.

Of New Plants there were several. From Messrs. Rollisson came the Java Rhododendron retusum, the Brassia cinnamomea, and the Odontoglossum Pescatorei mentioned in another column. Messrs. Veitch contributed the handsome light-coloured Camellia, Countess of Orkney, an Achimenes in the way of picta called gigantea, a Dendrobium allied to transparens, and though by no means new, the Yellow Side-saddle flower (Sarracenia flava). Concerning this and other Sarracenias it was mentioned, that although they brave the rigour of a Canadian winter with impunity, they have not been found to succeed out of doors in England, and the reason ascribed for this is, that our summers are not hot enough for them. They like a hot, moist atmosphere while growing, which is what they have in their native swamps; but when at rest they may be kept cool and comparatively dry.

Of Indian Azaleas there were two nice collections; one from Mr. Wood, gr. to G. W. Norman, Esq., of Bromley; the other from Mr. Todman, gr. to Mrs. Buckmaster, of Clapham Park. There was also a specimen of Smith's Azalea, from Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel Castle. In the group from Bromley was an example of Gledstanesi, variegata, and lateritia, all grafted together in one plant, the different coloured flowers thus intermixed producing a very beautiful effect.

Of Hyacinths a dozen charming plants was furnished by Mr. Cutbush, of Highgate. As regards colour the most remarkable among them were Prince Albert, a nearly black kind, and Cavaignac, a bright salmon-coloured sort with faint white streaks running down the centres of the petals. These are two varieties which no collection should be without.

Roses in Pots, not less remarkable for their clean bright green foliage than for the beauty and fragrance of their flowers, were furnished by Mr. Francis, of Hertford. The varieties consisted of Souvenir d'un Ami, Auguste Mie, Géant des Batailles, Madame Bravy, Comte de Paris, and other well known kinds, all of which were "worked" on the Manetti stock, which is a favourite with Mr. Francis. The same exhibitor likewise showed a collection of cut Roses, as did also Mr. M'Ewen, of Arundel, and a beautiful boxful of these flowers came from the Messrs. Paul, of Cheshunt. In the last-named exhibition we remarked examples of the new Rose Gloire de Dijon, which may be described as possessing the rich colour of Safranot, or rather perhaps that of Vicomtesse Decazes, with the fine full form of our English Rose Devoniensis. It is certainly a glorious addition to Tea-scented varieties, and that it stands forcing well was evident from the beauty of the blooms exhibited.

Of Orchids two fine collections were produced, one from Messrs. Rollisson, the other from Messrs. Veitch. Messrs. Rollisson's plants are fully described in another column. Messrs. Veitch sent Phalænopsis grandiflora, capital specimens of Cypripedium villosum and Dendrobium nobile, Vanda insignis and tricolor, the beautiful Dendrobium Farmeri, and Ansellia africana, the only Orchid known to come from Fernando Po, and that from a Palm tree, on which few of them like to grow. Mr. Wicks sent Miltonia candida and Sellaginella peruviana.

Of Cinerarias, one of the best collections perhaps ever shown was furnished by Mr. Turner, of the Royal Nursery, Slough. It consisted of the following varieties, which were pronounced by all who saw them to be "perfect gems," viz., Lablache, blue; Estella, white, broadly tipped with purple; Lady Mary Lambouchere, white, tipped with blue; Loveliness, purple, with a small ring of white round a purple centre; Lord Stamford, white, tipped with blue; Esther, white, with a dark centre, and broadly tipped with brilliant crimson; and Kate Kearney, a white kind. Along with these were also two or three others not for competition. Pelargoniums were confined to one collection, which came from Mr. Coe, of Ham. The sorts were Bloomsbury, Album multiflorum, Duke of Cornwall, Mrs. Johnstone, Silene, and Gauntlet, all kinds known to force well. Mr. Ingram, gr. to her Majesty at Frogmore, contributed cut specimens of different varieties of Begonias, chiefly hybrids raised by himself, and with whose brilliancy and beauty all were struck. In colour they may be said to have varied from delicate pink to the rich crimson or rather scarlet of B. fuchsioides. The best were perhaps suaveolens rosea, Ingrami, and

the varieties of nitida called rubra and rosea; but to particularise is needless where all are so well worth growing.

Mr. Snow, gr. to Earl de Grey, sent Amaryllis "Stephenia," a variety of A. Johnsoni with a large amount of colour in it. From J. Allnutt, Esq., came Camellia Donckelaari, and a large boxful of blooms of Camellias was furnished by Mr. Collins, gr. to E. H. Chapman, Esq., of Hornsey. Two collections of Stove and Greenhouse Plants were exhibited, one from Messrs. Henderson, of Pine Apple Place, the other from Mr. Davies, gr. to E. Rosher, Esq., Hamilton Terrace, St. John's Wood. Mr. Taylor, gr. to J. Coster, Esq., also had a most beautiful specimen of Boronia triphylla, covered with little pink stars, whose polished surfaces almost seemed to sparkle; and of Eriostemons, a class of plants with pale star-shaped flowers, there were some good specimens, together with a well-grown example of Acacia Drummondi, a beautiful species from Swan River, which flowers in a sufficiently small state to render it suitable for pot culture; this was shown by Messrs. Veitch. From Mr. Moore, of the Apothecaries' Garden, Chelsea, came the rare and extremely handsome Fern Nephrolepis davallioides.

Of Fruit there were several exhibitions. Black Hamburgh Grapes, very good bunches and well coloured, were furnished by Mr. Allport, gr. to H. Ackroyd, Esq.

Pine Apples were numerous. Mr. Bailey, of Shardeloes, sent a prickly Cayenne weighing 4 lbs. 4 oz.; Mr. M'Ewen, a Black Sugar Loaf weighing 5 lbs. 3 oz., a Smooth Cayenne, 3 lbs. 8 oz., and a Queen, 2 lbs. 10 oz.; Mr. Jones, gr. to Lady Charlotte Guest, had a Prickly Cayenne weighing 4 lbs. 15 oz., but it was somewhat over ripe. Mr. Brown, of Waltham Abbey, had a Moscow Queen, weighing 2 lbs. 9 oz.; and Mr. Clements, of Oak Hill, a Providence weighing 4 lbs. 6 oz., and a Queen, 2 lbs. 12 oz.

Strawberries in Pots.—Keens' Seedling and Cuthill's Black Prince were shown by Mr. M'Ewen, of Arundel, and Mr. Fleming, gr. to the Duke of Sutherland, at Clevedon. Mr. M'Ewen also furnished a dish of mixed Strawberries, consisting of Keens' Seedling and British Queen. The best dish of Strawberries, however (Keens' Seedling), came from the gardens of the Duke of Marlborough. These were fruit worthy of July; and little less can be said of a dish of Ingram's Prince of Wales from the Royal Gardens at Frogmore, and of a dish of Keens' Seedling from Mr. Snow. Mr. Brown, of Waltham Abbey, sent Keens' Seedling.

A plate of May Duke Cherries was exhibited by Mr. Slater, gr. to the Earl of Wilton at Heaton Park, near Manchester.

A small branch, with ripe fruit on it, of Rivers' Perpetual Raspberry was produced by Mr. M'Ewen, to show that Raspberries may be had now, as well as Cherries and Strawberries, if they should be desired.

Pears, equal to those of the best French growth, and in excellent preservation, were shown by Mr. Tillyard, gr. to the Right Hon. the Speaker at Heckfield. They consisted of Beurré Rance, Ne Plus Meuris, Easter Beurré, and Knight's Monarch. Beurré Rance Pears, large and fine, were furnished by Mr. Hill, gr. to R. Sneyd, Esq., of Keel Hall, Staffordshire; and some Pears and Apples, somewhat shrivelled, were shown from Liverpool by Mr. Hutchinson, gr. to H. Harrison, Esq.

Of French produce, in the shape of Apples and Pears, Mr. Lewis Solomon, of Covent Garden, sent a famous exhibition. Among the Apples were enormous fruit of Reinette du Canada, the beautiful little Pomme d'Api, and White Calville. These were remarkable for their bright polished skins, which were such as could only be acquired under a continental sun. The Pears, though fine, were nearly if not quite equalled by those from the garden of the Speaker already alluded to, except perhaps Uvedale's St. Germain, which were very large.

Of Foreign Vegetables Mr. Lewis Solomon sent a very fine collection, in which were enormous Cardoons, Cauliflowers, and Asparagus, French Beans, Globe Artichokes, new Potatoes, Horn Carrots, Tomatoes, quite ripe, and well coloured, roots of Oxalis crenata, young shoots of the Hop gathered before they had reached the surface of the ground; and an excellent forced Salad, consisting of Lettuces, Endive, Barbe du Capucin, and white and red Turnip Radishes.

Of English Vegetables, Mr. M'Ewen contributed Kidney Beans, young Peas, Potatoes, Seakale, Asparagus, and Mushrooms. From the Right Hon. the Speaker's garden came Rhubarb, Potatoes, Seakale, Mushrooms, Endive, and Cucumbers. Mr. Brown showed a dish of Sutton's Early Emperor Peas, which were good for this early season of the year.

Among Miscellaneous subjects were specimens of Bast from Messrs. Paul, and also from the East India Company. These were strong, though somewhat hard and coarse; Messrs. Paul are of opinion that theirs might be sold for about one-third less than Cuba bast. Mrs. Compton, of Collyer's Buildings, Blackheath Hill, again sent an example of her ornamental leather baskets. Mr. Rivers contributed a perforated circular tile or cover for keeping newly sown seeds from birds, &c.; and Mr. M'Laughlin, foreman to Messrs. Wood and Ingram, showed a square Orchid basket made of cylinders of burnt earthenware, holed at the ends to allow of their being fastened together with wire. Their great fault was thought to be their liability to break should they happen to meet with a fall or other accident.

From the garden of the Society came a collection of Begonias, the Swan River Trymalium odoratissimum, Thyrsacanthus rutilans, the little Violet Grass (Cochlearia acaulis), and one or two other plants.

The list of medals, &c., awarded on the occasion will be found in our advertising columns.

Notices of Books.

The Ferns of Great Britain and Ireland, by Thomas Moore, F.L.S.; edited by Professor Lindley; nature-printed by Henry Bradbury. Bradbury and Evans. Large folio; 6*s.* each part.

The following extracts from the editor's preface will explain the history of the present publication, to which great interest attaches, on account of the novelty and importance of the curious process which it illustrates.

"Everyone who has attempted to ascertain the name of a plant by comparing it with mere descriptions, is aware of the difficulty of effecting the object unless he is more familiar with the technical language of science than those commonly are who, although admirers of delicate texture, beautiful colour, or graceful form, do not profess to be skilful botanists. Even with the aid of drawings, investigation often leads to no satisfactory result, in consequence of the inability of art to represent faithfully the minute peculiarities by which natural objects are often best distinguished. If this is so with plants in general it is most especially true of Ferns, the complicated forms and tender organisation of which baffle the most skilful and patient artist, who can only give at the best an imperfect sketch of what he supposes to be their more important features. And herein lies the great defect of all pictorial representations. The draughtsman can do no more than delineate a part of what he sees; and whether he sees correctly what he delineates will at all times be a matter of doubt, especially where, as in natural history, minute accuracy is indispensable. But if minute accuracy is of more vital importance in one than another race of plants, it is most especially so among Ferns, in the distinctions of which the form of indentations, general outline, the exact manner in which repeated subdivision is effected, and most especially the distribution of veins scarcely visible to the naked eye, play the most important part. To express such facts with the necessary accuracy, the art of a Talbot or a Daguerre would have been insufficient until nature-printing was brought to its present state of perfection.

"The process of the Imperial Printing Office at Vienna, to which the name of nature-printing has been happily applied, and to which the work now offered to the public owes its origin, is a great improvement upon the old method, inasmuch as it represents not only general form with absolute accuracy, but also surface, hairs, veins, and all those minutiæ of superficial structure by which plants are known, irrespective of those hidden details of internal organisation. Moreover, an exact copy in copper of the part to be represented being employed by the printer, instead of so fragile an object as the plant itself, we obtain the means of multiplying copies to the same extent as in copperplate engraving; and hence the method becomes suitable for purposes of publication. The Germans have already availed themselves of the method, and with considerable success. Von Heufler has published a specimen of the Cryptogamous plants of the Valley of Arpasch, some of the figures in which are admirable representations of nature; and other works are announced as having made their appearance, or being in preparation, in the Austrian dominions.

"It is in emulation of such continental efforts that the present work has been prepared, with the view of showing by unmistakeable evidence in what the differences consist among the Ferns which grow wild in Great Britain and Ireland. It is true that nature-printing has its defects as well as its advantages: it can only represent what lies upon the surface, and not the whole even of that. But, on the other hand, its accuracy is perfect as far as it goes; and in the case of British Ferns it goes far enough for all practical purposes.

"The minute structures to which botanists trust for the distinction of genera, and to which nature-printing cannot be applied, are sufficiently pointed out by description alone, and, among the subjects of the present work at least, are in no need of delineation. It is not, indeed, too much to say that in many other plants besides Ferns a knowledge of the inconspicuous parts of fructification might be dispensed with if it were possible accurately to represent by figures, or to describe by words, the real forms and condition of the larger organs. But, when compared with the result of nature-printing, botanical drawings are often little more than indifferent diagrams. It is related of the late John Gough, of Kendal, that, having become totally blind from small-pox when two years old, he so cultivated his other senses as to recognise by touch, smell, or taste, almost every plant within 20 miles of his native place. It is believed that good nature-printing will convey to the eye the same class of positive impressions as those which were conveyed to the mind of Gough by other organs."

Garden Memoranda.

Messrs. Rollisson's Nursery, Tooting. — The Camellia house here has been extremely gay for some weeks past; but now, although it is still well worth inspection, its beauty is considerably impaired by the decay of many of the best blossoms. The house is a long lean-to, one end of which is filled with greenhouse plants, which are separated from the Camellias by a few large and fine specimens of the true Rhododendron arboreum. Of the different varieties of Aphelexis there is a fine assortment here, as indeed there is of most greenhouse plants, more especially of Cape Heaths, for which this nursery has long been celebrated. Of these there are some beautiful specimens, which are well set with bloom buds. Of the Java Rhododendron we noticed large quantities of plants. This variety is reported to succeed well enough in a cool greenhouse; but it is, unfortunately, not sufficiently hardy to stand out of doors. A new Rhododendron named retusum, also from Java, has just flowered here. Its blossoms somewhat resemble in shape those of the Jasmine-flowered Rhododendron, but they are smaller and of a deep orange colour. A well grown plant of it thickly furnished with blossoms, provided they are only bright enough, must, therefore, have a striking appearance.

Among Orchids, some noble plants were in bloom. Foremost among them must be mentioned specimens of Dendrobium macranthum, and a large-flowered variety of that kind; also the charming D. densiflorum; together with various plants of D. nobile; Burlingtonia fragrans; some of the better varieties of Cattleya Skinneri; the rare and beautiful C. Aclandiæ; Odontoglossum hastilabium, a white-lipped species with long narrow sepals and petals beautifully marked with bands of deep purple; the still scarce O. Pescatorei; and the graceful yet singular looking Cypripedium Lowi or Low's Lady's Slipper. This last had four beautiful blooms on it. A novelty was also here in the shape of Brassia cinnamomea, a species so named on account of half of each of its flowers being cinnamon-coloured. It is not a plant of great beauty, but it possesses an odour which is liked by some, and it will serve to make variety. Of Vandas several were in flower, and at an end of the house, which is somewhat damp and shaded, were some of the better kinds of Pitcher plants, while in a propagating house were numbers of Cephalotus follicularis, and young plants of Nepenthes, all raised from seeds. Of Ferns there is an interesting collection here, among which were examples of Platycerium grande; the most remarkable, however, was a noble plant of the rare Nephrolepis davallioides, whose graceful fronds measured nearly 3 feet in length, and half a foot in width. Of Begonias we noticed a Java kind, with handsome foliage, covered all over with bright red hairs; and of Meyenia erecta, a new tender greenhouse shrub from Cape Coast, a few plants were pointed out, and if its flowers at all agree with those in drawings of it, it will certainly be an acquisition. They are represented as being nearly as large as a half-crown piece, and of a beautiful blue with a light eye. Among Vacciniums was Rollissoni, a small, deep crimson-flowered kind, which is said to be hardy; and among Conifers were fine plants of the different sorts of Araucarias, the as yet little known Thujopsis borealis, Podocarpus antarctica, and the smaller-leaved P. acicularis, together with fine plants of the new Thuja gigantea, which is said to be the same as the Libocedrus decurrens of Torrey.

Out of doors, in a large American ground which the Messrs. Rollisson have at some distance from the home nursery, many of the Rhododendrons have been browned and otherwise hurt by the frost, especially some of the early crosses from arboreum; with the exception of these, however, no great amount of damage has been sustained. Large quantities of Sikkim Rhododendrons are grown here; but they are in pits; they, therefore, have wintered safely. Indeed, R. Edgeworthi promises soon to be in flower.

Of new houses one or two are being erected for soft-wooded plants, such as Pelargoniums and things of that sort, to the growth of which the Messrs. Rollisson are about to devote especial attention.

FLORICULTURE.

The Cineraria.—Where do we find a plant, which during the autumn, winter, and early spring months, is so gay and beautiful as this; or one which is so useful for exhibition or decorative purposes, or for the embellishment of the flower-vase or bouquet? By gas or candle-light, the colours of some of the rose, crimson, and purple varieties are extremely brilliant; while the white varieties, margined with the preceding colours, are matchless. Add to this, that many of the kinds are agreeably fragrant, and you have nearly all the qualities which constitute a useful flower. In treating of the Cineraria as a plant for exhibition, or of its value for decorative purposes (and, in the early part of the season, the plants make a fine display), I cannot refrain from stating that their cultivation should be much improved, and indeed must be before they will assume their wonted standing upon our exhibition-tables. Only a few years ago Cinerarias were but a set of poor, starry things, with narrow, flimsy petals, and flowers supported by tall, unsightly stems; but now, thanks to the march of improvement, the best varieties are dwarf and compact, and, when properly grown, produce perfect trusses of stout, and, in some few cases, of almost perfectly-formed flowers. When high cultivation is aimed at, peculiar treatment (which I shall presently describe) is required to produce stout, healthy cuttings, as from such the Cineraria can only be properly grown. As the plant is now in bloom, and seedlings will be required, a few of the most esteemed varieties should be selected for that purpose, bearing in mind that those chosen must be of the best possible form, clear colours

and marking, as much depends on this in producing new and first-rate varieties. When this is done, some secluded place in the garden should be selected, to keep them entirely apart from any inferior varieties, with which the bees would cross them, and produce muddy, unsightly flowers, instead of clear and well-defined colours. When the seeds are ripe, sow immediately in some shady place; and as soon as large enough, prick off thinly into pans or wide pots, and keep close for a few days, until they are properly established, when they may be removed to the open air until large enough to place in single pots: should large plants be required, they should be stopped when about 2 or 3 inches high. As soon as the seeds are gathered, the old plants should be cut down, or partly so, as in many instances the crowns of the plants rot if cut too close to the surface. Now that they are cut down, remove them to some shady place (a north border being preferable), until they throw up young shoots, when they should be potted into larger pots, in a light compost, or planted out in the open ground in a light soil, where they will furnish strong cuttings, and from these only can good specimens be obtained. When they have grown about an inch or two, remove the cuttings, and place them in mould prepared for the purpose—composed of equal parts of loam, leaf-mould, and silver sand, taking care to well drain the pots with potsherds. When rooted (which will be in about a fortnight), pot off into thumbs or 3-inch pots, in a nice light soil. Should first-rate plants be wanted, every care will now be required to keep them in a growing and healthy condition, to which end they should be shifted every few weeks, until they receive their final potting, which should be about January; every care should be taken that they do not get pot-bound in the small pots, as that would throw them into a blooming state immediately. The compost I would recommend for specimens intended for exhibition, and for large plants generally, would be two parts of good turfy loam, and equal parts of well-decomposed cow-dung and leaf-mould, with an admixture of silver or river sand. As the plants grow, take care to thin out all superfluous leaves, so as to admit the air freely and prevent mildew, which is a great pest, and which can only be removed by applying sulphur to the parts affected. The Cineraria should only be stopped once, as the second operation tends to produce weak growth. As soon as the shoots are long enough tie out wide, keeping the outer branches as low as possible, and place them close to the glass, which will insure dwarf and compact plants. I had nearly forgotten the drainage, which should be of rough leaf-mould and potsherds mixed, which will keep the roots in a white and healthy state; fumigate occasionally, to prevent the green-fly; and water very sparingly through the winter months, increasing the supply as the spring advances, when weak liquid manure may occasionally be given. *S.*

Hollyhocks: *A.* They may be propagated either by division of the roots, by cuttings, or raised from seed. The seed should be gathered from the best coloured double varieties, and when cleaned from the husk it should be stored in a dry situation until now, when it should be sown broadcast, either on a gentle hotbed or on a warm sheltered border prepared for the purpose. As soon as the young seedlings will bear handling they should be transplanted into a rich soil in rows 2 feet apart, and the plants should stand 1 foot asunder in the rows.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Where there is proper convenience for growing plants the show-house will now be very gay, as Azaleas and some of the New Holland plants, &c., will be in bloom. While in flower these are exceedingly gay; but their beauty is but short-lived if exposed to bright sunshine in a dry atmosphere, and as they are what may be termed expensive plants, requiring considerable care and time to get good-sized specimens of them, every means should be used to preserve their flowers in beauty. The beds, borders, and every available space, should be lightly sprinkled on the mornings of bright days, in order to counteract the effects of the prevailing dry winds; a thin shade will also be indispensable on the forenoons of sunny days, both for protecting the blossoms from bright sunshine and keeping down the temperature without letting currents of cold drying air pass over the plants. Use shading sparingly, however, at present, and have it removed immediately it may be safely dispensed with. Remove decaying flowers directly they are perceived, and endeavour to be prepared with specimens in full beauty to replace any that begin to look poor. Greenhouse.—Ventilate cautiously here in the present state of the weather, especially near recently potted specimens, avoiding all direct currents until the weather becomes warmer and the atmosphere moister. Proceed as diligently as circumstances will admit with repotting and training young stock, taking care that the balls are in a rather moist state before potting, and also to place them in a close part of the house, sprinkling the shelves, &c., frequently, to assist in affording them a moist atmosphere. Do not neglect Correas, Epacrises, and other early winter-flowering things; but let these have every possible attention, in order to induce them to make their growth early. Examine large specimens very carefully, for the purpose of ascertaining whether the balls are properly moist, and where it is found that this is not the case, see that they are thoroughly soaked at once, for the present weather will speedily ruin plants that are dry at the root. A gentle syringing on the afternoons of sunny days will now be beneficial, but this should be done early, shutting up the house before the temperature gets too low; and where for any reason this cannot be done, the syringe had better not be used over the plants until the weather becomes warmer. Stove.—The twiners here will be in free growth, and will require frequent attention to keep their shoots from getting entangled, &c. It is a great saving of time to go over this kind of work frequently, as the shoots of such things are easily regulated when this is done at the proper time; but if allowed to grow into each other, they are not easily unravelled. Endeavour to keep young growing stock near the glass, and attend to repotting, stopping, and tieing out as may be necessary. Large specimens should be frequently turned in order to prevent the young shoots from drawing to one side. Look sharply after insects, and spare no pains to extirpate mealy bug and black thrips; keep the floors, &c., regularly moist; syringe the plants lightly over head early in the afternoon, shutting up early, so as to saturate the atmosphere with moisture. In the present state of the weather give air cautiously, opening the top sashes, and this only as far as may be necessary to prevent burning. Most stove plants enjoy a moderate supply of manure water while growing freely, and this should be given liberally to such things as Clerodendrons, &c., using it very weak at first, and taking care to have it at about the same temperature as the roots are growing in. A little of this sprinkled about the pots in the evening so as to charge the atmosphere with ammonia, will also be beneficial to the plants. See to having shading in readiness, for some things are very impatient of bright sunshine at this season, particularly when air cannot be given freely without rendering the atmosphere too dry.

FLOWER GARDEN AND SHRUBBERIES.

The dry state of the ground affords a very favourable opportunity for making preparation for planting Roses that may have been wintered under shelter. It is hardly possible to render the soil too rich for this favourite flower, nor to get them to thrive save in very rich soil. The beds should be made at least 2 ft. deep of good strong loam, adding some 3 or 4 inches of old rotten cow manure, which should be well incorporated with the soil. It will also tend to improve the texture of soil, and more thoroughly incorporate the manure with it if the beds can be turned over two or three times when the surface is in a dry state. Planting out should be deferred until we experience a favourable change of weather, particularly in the case of Teas, &c., and plants that are starting into growth. If not already done, pruning should be finished, unless it is desirable to retard the blooming of a portion of the plants, and in this case the pruning of these may be deferred for a week or so. Where any alterations are in hand involving the transplanting of large shrubs or trees, the ground, &c., should be prepared, so that the plants may be removed to their fresh quarters immediately the weather becomes more favourable for this kind of work, but it will be safer not to disturb large plants while cold drying winds prevail. Attend to recently transplanted things, and do not let them suffer for want of water at the root. See to getting hardy annuals sown about the borders, &c., for early summer flowering, and get stocks that have been raised under glass strong and ready for planting out as early as possible.

FORCING DEPARTMENT.

Pineries.—In the present state of the weather it will be nearly impossible to maintain a properly moist state of the atmosphere without the aid of shading; for, if sufficient air is admitted on bright days to keep down the temperature, the atmosphere is speedily robbed of its moisture, and the foliage at once feels the change, and is easily injured by bright sunshine acting upon it in its exhausted state. We are no advocates for shading Pines when it can be dispensed with, consistent with the well-being of the plants; but save in the case of tank or dung pits, where a constant stream of moisture can be commanded, it is nearly impossible, in the present state of the weather, without the aid of shading, to maintain a sufficiently moist atmosphere, either for young growing stock or for plants swelling their fruit. A very thin material should be used, however, and this only for a few hours on the forenoons of bright days. Growing stock and fruiters should be lightly syringed every fine afternoon, shutting up the house early, but do not use the syringe too freely, as this is apt to render the soil about the collars of the plants too wet, and water, when allowed to lodge in the axils of the leaves, tends to disfigure and render the foliage weakly. See that the whole of the stock, whether in pots or planted out in the open bed, is kept in a healthy state as to moisture at the root, for any neglect in this respect at the present season will be most injurious, and may cause a large portion of the young stock to show fruit prematurely. In watering Pines, the same attention and care should be exercised as in the case of more tender things, looking over the plants often, watering only such as are dry, and giving these a liberal soaking. Vineries.—The unusually severe winter, and the long continuance of cold weather will render this a memorable season to those who have had much to do with early forcing; for fire-heat, even in its best applied forms, can only be considered as little better than a dangerous necessity. And when a comparative absence of sunshine and prevalence of cold weather extend far into the spring, as has been the case this season, rendering its use necessary to a larger extent than has been the case for many years, it will not be surprising if the ill effects of so much artificial heat should be here and there apparent in weakly foliage becoming the prey of red spider. Where the Vines are strong and a healthy root action can be secured there will not be so much to fear from the attacks of red spider, but in the case of old sickly Vines and badly conditioned borders, and these two generally go together, the most assiduous attention will be necessary to keep this pest from making its appearance. The atmosphere should be kept moist, using fire-heat as sparingly as possible, and if spider makes its appearance it must be eradicated at once either by washing every affected leaf with a sponge, or by a liberal use of the syringe as long as this can safely be used, so as to avoid having to contend with this enemy when the Grapes are colouring. The pipes should also be coated with a mixture of sulphur and lime, renewing this occasionally as it gets worn off. Stop laterals as they make their appearance, and keep the shoots thin and regular in order to expose the foliage as much as possible to the light. Ventilate very cautiously, opening the top sashes only on cold drying days, and shut up early in the afternoon. Peaches.—Where the stoning process is over there will be little or no danger of the fruit falling, therefore if the crop has not already been sufficiently thinned this should be done at once, and if fine fruit is an object thin liberally. Keep the trees moist at the root after stoning while the fruit is swelling rapidly, and weak manure-water may be given with advantage to such as show any indications of weakness. Also secure a moist atmosphere by frequently sprinkling the floors, &c., and use the syringe freely on the afternoons of bright days to prevent the appearance of red spider.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending April 5, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 9th, 1844, and 14th, 1852——therm. 73 deg.; and the lowest on the 11th, 1841, and 13th, 1853—therm. 22 deg.

Notices to Correspondents.

American Blight: *Lower Beeding.* Prune your trees hard in, then paint them all over down to as far below ground as you can get with the following mixture, viz., half a peck of quick lime, half a pound of flowers of sulphur, and a quarter of a pound of lamp black mixed with boiling water till of the consistency of paint. Before applying it, however, take care to scrap off all loose bark and burn it.‡

Books: *Sub.* There is no separate book on nursery work that we know of. You will probably find all you want to learn in Brown's "Forester." The most complete catalogue of trees is that of the Horticultural Society, with its supplement. Both may be had of all booksellers.

Diseases: *Aleph.* It is seldom safe to give any judgment without some sort of ocular inspection. There can, however, be little doubt that yours is a case of canker, which assumes many forms, and arises from many causes. Where it is local and arises from local causes, excision may prove efficacious, but where it is constitutional no cure is known. We have ourselves, just discovered a vexatious case of canker on the stem of a Pear tree of extraordinary vigour, which bore a large crop last year, and is laden now with flower buds. That the tree will fall a sacrifice we have no doubt, and we have, therefore, left it to take its chance. *M. J. B.*

Flax: *A Farmer* will find the best information in Dr. Ronalds' new work on "Fibrous Substances," noticed last week. For machines, he should apply to the nearest machine maker.

Galvanised Iron: *A Sussex Man* seeks for information as to whether patent galvanised iron hothouses have been found generally to answer, and especially during the late severe winter; and also which, in the opinion of our correspondents, is best—wood or galvanised iron for garden buildings.

Hollies: *Watford.* Had your large plant been removed in September we should have acceded to your own theory. The operation having been deferred till the present time we must agree with your gardener.

Lilium giganteum: *A Sub.* Sow it *on* damp peat in a cool bed, covering it with a little moss to guard it from light. Too much moisture, or being covered with earth, is fatal to it. Perhaps your seed is bad, as is often the case.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Ashbu.* Myrsine africana.—*A B C.* Chrysosplenium hederifolia.—*A D.* 1, Dendrobium chrysanthum; 2, D. cærulescens.—*T D H.* One of the many varieties of Dendrobium transparens.

Strawberries: *Oxonian.* The blossom buds were doubtless killed by the frost while the plants were plunged in the open ground.‡

Misc: *C N R.* You can have the numbers mentioned in your note.—*K W.* Lobelias are poisonous plants.

THE AGRICULTURAL MACHINERY DEPARTMENT OF THE CRYSTAL PALACE will be ready for Public Inspection on and after EASTER MONDAY. It contains the largest and most complete Collection ever exhibited, comprising the most approved Agricultural Implements and Machines by all the first-rate makers. By order.

Crystal Palace, April 7. G. GROVE, Secretary.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, WILLIAM DRAY & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.

Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value; it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
OFFICES, 37, CHARING CROSS, LONDON.

Directors.

The Hon. J. W. Fortescue. | General Macdonald, C.B.
G. P. Irvine, Esq. | Newton S. Scott, Esq.

Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Solicitors—Messrs. Vallance & Vallance, 20. Essex Street, Strand.
Agricultural Chemist—William White, Esq.
Secretary—Mr. W. F. Mould.

The Directors invite the attention of landed proprietors, agriculturists, &c., to the Patent Cyanic Manure, as containing the most approved elements of fertilisation in their just proportions; it can be, therefore, confidently recommended as a very superior dressing for Wheat, Barley, Oats, Clover, Grass, &c. Price 8*l.* per ton.

Prospectuses (with practical directions for use) may be had on application, or will be forwarded by post.

All orders, applications for Agencies, &c., to be addressed to the Secretary, at the offices of the Company, 37, Charing Cross.

THE PATENT NITRO-PHOSPHATE OR BLOOD MANURE COMPANY.—Provisionally Registered pursuant to the Act 7 & 8 Vict. c. 110.

Trustees.

Abel Smith, Esq., Jun., M.P., 2, Halkin Street West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.

Directors.

Chairman.—Jonas Webb, Esq., Babraham, Cambridgeshire.
Deputy-Chairman.—John Sharp, Tower Villa, Queen's Road, Regent's Park.

Edward Bell, Esq., Tottenham, Middlesex. | Robert Leeds, Esq., West Lexham, Norfolk.
John Clayden, Esq., Littlebury, Essex. | Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Richard Hunt, Esq., Stanstead Abbot, Herts. | Thomas Nash, Esq., Great Chesterford, Essex.
Thomas Knight, Esq., Edmonton, Middlesex. | James Odams, Esq., Bishop Stortford, Herts.

John Collins, Esq., Middleton Square, Pentonville.
With power to add to their number.

Bankers.—Messrs. Barnett, Hoare & Co., Lombard Street.
Auditor.—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors.—Messrs. Kingsford & Dorman, 23, Essex St., Strand.
Secretary and Chemist.—James Taylor, Esq., F.C.S.

MANUFACTORY, PLAISTOW MARSHES, ESSEX.

The Directors of the above Company beg to call the attention of their friends and the Agricultural Community to their Blood Manures for Corn and Turnips, which have been used with the greatest success in all parts of England, and to assure them that having now erected commodious Works, with every suitable convenience for carrying on the manufacture on a large scale, under the management of an experienced practical Chemist, the Agriculturists of this country may depend upon having a manure of proved high quality, which the Directors guarantee to be genuine. It is sent out in the form of a fine friable powder, which may be sown by the drill or hand with the utmost facility.

They beg to caution the public against the attempts of spurious imitators, who, since the introduction of this Manure, have professed to make one possessing similar qualities. As security, therefore, to the purchaser, every bag is marked "Odams' Patent Blood Manure," and sold only by the authorised Agents of the Company.—Corn and Grass Manure, 7*l.* 10*s.* per ton.

Directions for Use.—From 2 to 3 cwt. per acre, according to the condition of the soil. It may either be drilled in with the Seed, or sown broadcast; if the latter, it should be well harrowed in. Turnip Manure, 6*l.* 10*s.* per ton.

Delivered at any Railway Station or Wharf in London.

Applications to be made to ODAMS, PICKFORD, & KEEN, Agents for the above, 35, Leadenhall Street, London.

SUTTON'S PERMANENT GRASS SEEDS,

Price 24s. to 30s. per Acre.

GENTLEMEN intending to lay down LAND to PERMANENT PASTURE, or for one, two, or three years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable. Having had many years' experience in laying down Land to Permanent Pasture in almost every part of the kingdom, we can confidently undertake to supply the sorts of Seeds best adapted to the land to be laid down.

EXTRACTS FROM LETTERS TO MESSRS. SUTTON.

It may appear superfluous that we should publish anything in the way of testimonial; we will, however, quote the following from among many other letters now before us:—

From Mr. C. Judd,
Gardener to his Grace the Archbishop of Canterbury.

"The Grass Seeds received from you succeeded admirably, and, although sown late, the growth was such that we were enabled to mow the Churchyard in the autumn, and it has now the appearance of an established lawn of some years' standing; and my employer, the Archbishop of Canterbury, is quite satisfied with its appearance."

From Mr. Dowdeswell, Steward to R. B. Sheridan, Esq.

"The Grass Seeds have turned out uncommonly well, and we have some very fine crops of Turnips, Swedes, and Mangold Wurzel."

From the Rev. Joseph Gibbs, Clifton, Hampton.

"The Pasture made with your seed is every year improving, and getting more Clover in it, which is more than I expected, as the land hereabouts is not calculated to grow good natural Grass."

From Professor Lindley, Horticultural Society, 21, Regent Street, London.

"We have already made trial of your Grass Seeds, and it is only justice to say that they have proved the best we have sown for many years."

From the Rev. J. Lawson Sisson, Edingthorpe Rectory, North Walsham.

"I have one piece of land, sown last year with your Permanent Grass Seeds, and no one can possibly tell it from an old meadow save in the absence of weeds. I have had a great deal of feed from it also."

From Mark Philips, Esq., Snitterfield, Stratford-on-Avon.

"The Permanent Grass Seeds supplied me last spring are remarkably strong and healthy."

From William A. Commerell, Esq., Strood Park.

"I forward a cheque for the Grass Seeds supplied by you, and am glad to be able to bear witness to their quality, having found them so very superior to what I have generally obtained."

The Rev. Joshua Bennett, Caverson Parsonage.

"In less than three months it has presented a most luxuriant herbage, forming a striking contrast to the self-sown turf around it."

From P. Pusey, Esq., Pusey.

"I was particularly pleased with your Grass Seeds, which I employed for laying down fresh broke land. It became a close, fine sward, by August."

From the Rev. Mr. Wingfield, Gulval Vicarage, Penzance.

"My pasture laid down with seeds from you in March, 1851, is in a very luxuriant state, and in every way satisfactory. The Clover Seed also, sent during the present year, has grown admirably."

From R. Tull, Esq., Crookham House, near Newbury.

"The Grass Seeds sent in the spring to sow for a pasture grew remarkably well, and the present appearance of the pasture is most satisfactory."

From N. Manby Power, Esq., the Hill Court, Ross, Herefordshire.

"The Grass Seed sent has answered very well, and is almost a sward already."

From Rev. Robert Hawthorn, Stapleford Lodge, near Cambridge.

"I was very much pleased with the Grass Seeds which you sent me; the Grass sprang up quickly and covered the field well."

From the Rev. Jerome Clapp, Odem House, Appledore, Devon.

"Allow me to say that the Grass Seeds you sent me have fully realised my highest expectations."

SUTTON & SONS, Seed Growers, Reading, Berks, *having made the cultivation of Natural and Artificial Grasses the subject of their especial attention for many years, have much satisfaction in receiving (besides very many others,) the above communications quite unsolicited.*

Clovers and Grasses for One, Two, or Three Years' Lay, 12s., 16s., and 22s. per Acre.

A Priced List of Mangold Wurzel, Turnips, and other Agricultural Seeds may be had post free on application, addressed

JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq. | William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S. | Sir S. M. Peto, Bart.
Henry Currie, Esq. | William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq. | William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

ROYAL AGRICULTURAL COLLEGE,
CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—John Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

Students are admitted after the summer and winter vacations, also in April and October. The Annual Fees for Boarders vary from forty-five to eighty guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PRIZE SHEETS and CERTIFICATES of ENTRY for the CARLISLE MEETING may be had on application to the Secretary of the Society, 12, Hanover Square, London; to whom all Certificates for Implements must be sent by the 1st of May, and all Certificates for Stock by the 1st of June.

TESTIMONIAL TO J. B. LAWES, Esq.—The Committee beg to inform those interested in the above undertaking, that the New Laboratory is expected to be ready for presentation in May or June, until which time the Subscription List will remain open, to afford an opportunity to any who may still wish to associate their names with this acknowledgment of Mr. Lawes' services.

Communications to be addressed to
Mr. W. KEEL, Hon. Sec., Harpenden.

SEEDS CARRIAGE FREE.

AGRICULTURAL SEEDS.—*Landed Proprietors and Farmers who require* LARGE QUANTITIES *of Turnip, Mangold Wurzel, Carrot, or any other kinds of Agricultural Seeds, will be supplied on the most liberal terms.*—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

GRASS SEEDS.—CARRIAGE FREE.

PERMANENT PASTURE GRASS.—*The very best Selections can be obtained from* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth,—all new and carefully selected, from 24s. to 30s. per acre.*

ORNAMENTAL LAWNS, PLEASURE GROUNDS, &c. The choicest varieties for producing a fine sward for Lawns and Pleasure Grounds can be procured from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, at 18*s.* per bushel, 2*s.* 6*d.* per gallon, or 1*s.* per lb.

RENOVATING GRASSES—for sowing over land deficient of plant—can be obtained at 9*d.* per lb.

A complete descriptive List of Grasses will be found in "RENDLE'S FARMING PRICE CURRENT," *and some valuable Tables, and other information relative to the best varieties for certain Lands and Situations.*

Apply to WM. E. RENDLE & Co., Seed Merchants, Plymouth.
ESTABLISHED SEVENTY YEARS.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the SEEDSMEN to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.
RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.
CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.
PARSNIPS.—Gibbs' large Guernsey Cattle, common large.
MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.
CABBAGES.—Large Drumhead Cattle, Thousand headed.
TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, Globes or Rounds, Tankard's sorts, Kohl Rabi.
Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.
KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of both Agricultural and Garden Seeds sent free by post on application to THOMAS GIBBS & Co., Corner of Half-Moon Street, Piccadilly, London.

AGRICULTURAL SEEDS,
MEADOW & PASTURE GRASSES, &c.

PETER LAWSON AND SON, of Edinburgh and London, the QUEEN'S SEEDSMEN, NURSERYMEN, and WOOD FORESTERS; and to the HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND, beg to intimate to their English Customers and the Public that they are now sending out FARM SEEDS of every description, saved from genuine stocks, and for which they respectfully solicit orders.

Also Garden Seeds, Flower Seeds, Garden Implements, Draining Tools, and everything connected with their trade. Catalogues will be sent on application.

London Branch, 27, Great George Street, Westminster.

P. L. & S. are always able to recommend experienced Bailiffs, Gardeners, and Foresters.

The Agricultural Gazette.

SATURDAY, APRIL 7, 1855.

"AN Englishman" writes to the *Times* in reference to the so-called Bird Island, which has been claimed by the Venezuelan Republic, inquiring to whom the sovereignty of the island rightfully belongs.

Venezuela has its sea board on the north coast of South America, and this island, it is said, must not be confounded with one of the same name lying near that shore, between the islands Les Roques and Buenayre. It is one of the more westward of the Carribean group, lying some 150 miles west of the British island Guadaloupe, and the large deposits of guano said to be lying there seem to have been appropriated by mere "seizure and occupation." In the meantime it appears that, on the 21st of December last, the Venezuelan Secretary of State for the Home Department signed a contract with a citizen of the United States, named D. F. Wallace, conceding to that person the exclusive privilege of procuring at, and exporting guano from, Bird Island during a period of 15 years, in consideration of a payment to Venezuela of 4 dollars a bushel thus exported; Mr. Wallace furthermore binding himself to advance to the Venezuelan Government a sum of 200.000 dols. on account of that contract.—The sooner the worth of such a contract is tested the better.

Such peculiar changes as have taken place during the last four months in temperature and the general condition of the weather, can scarcely be expected to pass by without some marked effect upon the Wheat Crops. The seed was committed to the ground in a season of unusual dryness, and it was six or seven weeks before the first leaf appeared above the ground; the high temperature and genial weather immediately after Christmas caused a peculiarly rapid growth, which was checked at once by nearly two months severe frost, succeeded by drying north east winds, pulverising the surface, and in many cases exposing the tender stem, the consequence of all which has been that in some districts* not only do the fields without close inspection appear almost bare, but a great portion of the plant has either already perished or is perishing rapidly.

If this were a case of mere thinness of plant, we should not think it worth while to call our readers' attention to the subject, for we have known cases in which there was apparently scarcely any hope, improve so rapidly after two or three careful hoeings, in consequence of excessive tillering, as to afford ultimately a far better produce than breadths which at first wore a far more favourable aspect. In the present case, however, the plants which seem likely to stand do not bear a proportion of one in a hundred to those which must inevitably perish, or are already dead. On the slightest touch many of those which have some little trace of green about them separate from below, as if destroyed by wire-worms. If, however, the diseased plants are carefully dug up, all will be found in connection with the seed and roots; but the roots are withered, and the shoot is either soft and pappy and in a state of decomposition, being brown instead of white, or where there is some indication of life, there is incipient canker, many of the cell walls being brown and charged with humates or ulmates, while the spongelets are for the most part dead or greatly discoloured. There was not a trace of any insects, and scarcely any of fungi, and there can be no doubt that the ungenial condition of the atmosphere succeeding to the increased excitability consequent on the previous warm weather has acted unfavourably upon the plant, and possibly another cause may have been at work of which we shall speak presently. Meanwhile what is to be done? In the cases which have come before us we feel sure that the decision to drill in fresh seed, which is quite practicable without ploughing, from the pulverised condition of the soil, is the only one which can lead to any good result. To wait for improvement is quite useless. Seventy acres out of 90 in one case are beyond hope, and in the neighbouring farm 50 must be resowed. It would not, indeed, be wise to take such a measure without careful examination; plants if still healthy, however dwarfed and miserable they may now appear will recover under more favourable circumstances, but where they are evidently dead or rapidly dying, it is well to take time by the forelock and to apply a remedy as quickly as possible.

We suspect, however, as said above, that there may be another element in the question. The seed remained many weeks without germinating. Is it not possible then that injury may have been imbibed from the metallic poisons with which the seed was dressed? The inquiries which we have at present been able to make tend to show this. Where the general crop is healthy, lime alone or lime and salt have been used, but the answers in the other cases have been, that sulphate of copper (blue vitrol) or some of the advertised dressings, all of which we believe are highly poisonous, have been used. It is true that in ordinary cases such dressings are not injurious, but many persons suffered two years since in consequence of the weather being too wet to get the seed which had been dressed with arsenic, corrosive sublimate or blue vitriol into the ground; and we see no reason why injury to some extent should not take place when the seed is really placed in the soil, but cannot germinate at all, or only slowly, because of its dry condition. The subject is well worth consideration, and the more so because poisonous dressings are altogether needless. Quick-lime, when properly applied, is perfectly efficacious and safe; and the best dressing of all is a solution of Glauber's salts (sulphate of soda) succeeded when the Wheat has been drained by a dredging of quick-lime, the lime and sulphuric acid combining to make sulphate of lime or gypsum; while the caustic soda acts upon the spores of the bunt, to destroy which is the main object of dressing. We shall be anxious to learn whether the malady is widely spread or not, and if any communications are made to us confirmatory of its prevalence, we should be glad to know what dressing has been applied. *M.J.B.*

* We speak more especially of the northern part of Northamptonshire.

Steam Cultivation having become so far practical that a handsome prize is to be awarded in July to the best invention able to accomplish it, we may venture to offer a renewed series of observations on the subject. And we may commence by congratulating Mr. Hoskyns, and any other advocate for steam-farming, upon the late rapid progress and promising prospects of their cause. In the days of our childood we remember sketching an out-door threshing machine, with a steam boiler in place of horse works, and the engine crank-shaft where the "spindle" should be. This was a mere whim; but in after years a Lincolnshire farmer, we believe, suggested to a machine maker the first notion of such a portable steam-thresher, and what was our delight at seeing at a fair—now 10 or 12 years ago—a threshing machine mounted upon the carriage-frame of a portable steam-engine, and frightening all the farmers who crowded round it to see fire and straw in such dangerous proximity! The enterprising firm who constructed it had it in model several years before, but business considerations had prevented them from sooner setting up a rival to the universally used horse wheels.

In 1841 a portable steam-engine was first exhibited at the Royal Agricultural Society's show held at Liverpool, and was styled in the judges' report "the great novelty of the meeting." And it may perhaps be almost a parallel to the well-known engineer's prediction that a steam-vessel could not cross the Atlantic, to record that the firm who manufactured this very engine were of opinion (we believe) that however promising and ingenious, *portable steam-engines would never be found to answer.* At Bristol the next year, this engine was shown having four wheels instead of only two, and was made also locomotive. There were also two others portable, but not locomotive, by other makers. At Derby in 1843 three were present; and steam-engines there first figured as a class in the prize list. At Shrewsbury, in 1845, there were only two; at Newcastle, in 1846, *only one.*, At the last year's meeting at Lincoln, however, there were 40 portable steam-engines, and a good many fixed engines besides, for agricultural purposes. In 1851 the number of portable steam threshing machines in the kingdom was computed at 8000; and as since that time many firms have been each turning out several new ones every week, and as a steam-engine (like a certain patient beast of burden) never dies—being renewed from time to time, still preserving its individuality, like a clasp-knife after several new blades and hafts—there must be several thousands more now busy in our farm-yards and fields. Well, this is a bright beginning in the application of steam *portable* power to agricultural operations; and we refer only to the *portable form* of this power because of its being adapted to the various processes of tillage. Steam threshing machines were invented, made, exhibited; were encouraged with premiums; and are now successful and in general use—and all within a very few years. Steam cultivators have likewise been invented, constructed, tried, and at last are to be exhibited for a prize: what is there to prevent their further career in becoming established as common business requirements? In 1841 the steam threshing machine was "the great novelty;" in 1851 the chief agricultural novelty was the machine which excavated drains, and laid in its own pipes; and this, which was considered Utopian by so many beholders, has become, through Mr. Fowler's ingenuity and extraordinary perseverance, a successful *steam draining machinery*, of which, we believe, he has now 17 at work, and by which he has already drained more than 10,000 acres.

Here we have the grand agent steam coming step by step nearer to the prime labour to which we are seeking to yoke it. Considered in 1841 unable to be made moveable in the yard, field, and over farm-roads with permanent advantage, it has overcome all difficulties in this respect: next, considered as confined to such *millwork* as threshing, grinding, sawing, pumping, with *stationary machinery*, it has belied the general opinion by laying hold of a *travelling implement*, and causing it to traverse up and down a field so as to perform its required work; and it does this efficiently, and at a profit. But if it can drag one tool it can another; and the mechanical *possibility of some kind of steam-cultivation is therefore proved.* Are we then to say, "Possible it may be, but it will never be found effectual and economical? Steam-power has certainly shown that it is not restricted to our barn machinery, &c.; but it is adapted at most only to traction implements of very great draught (such as the drain-plough), and which perform operations previously found to be highly expensive." Such a limitation as this, to the last achievement of steam power we may happen to have seen, is hardly philosophical, and is certainly rather insulting to the dignity of the steam-engine. Besides it is not predicating the exact truth. *Steam power has been applied to the traction of common ploughs*, with or without subsoiling-tines, or harrows, &c., following after,—and applied, too, with success, as far as the quality of performance is concerned. And improvements in the mode of connecting the power with the implements are being contrived from time to time, so that we have arrived very nearly at an economical method of ploughing by steam. We allude to the long and persevering trials of the Marquis of Tweddale, Lord Willoughby d'Eresby, and some previous experimenters.

We have strong expectations, therefore, of a speedy solution of the great problem. Never mind about the plough being an imperfect implement: if a steam-engine once works this tool so foreign to its abilities, we do not despair of quickly substituting something better adapted to the new motor. But on light land the plough is not to be easily beaten; and having once managed to work *it* well, there is no grubber, broadshare, presser, forker, &c., that need be refractory. On heavy soils, perhaps, steam-ploughing may be a forthcoming *possibility*; but the *desideratum* is a far different order of operation. *I. A. C.*

As the cultivation of meadow land should at this time be occupying the attention of the farmer, we are induced to offer a few notes on a subject apparently much neglected, or at best only partially attended to, namely the weeding of pastures. That pastures require weeding is a matter which to some would admit of question we are fully aware, for many conceive that herbage of all kinds is useful in pasture as tending to improve quality and make up bulk, and yet it is questionable whether some of even the larger plants allowed in pasture do not derogate from the goodness of the sample, while at the same time they diminish the amount of crop. These are facts which we hope to fully prove in discussing the natural history of some groups of weeds, in the order of the following table:—

1st. Poisonous weeds, or plants injurious to cattle.
2d. Weeds which prejudice a pasture by reason of their mechanical structure.
3d. Innutritious weeds which dilute the feeding properties of the sample.
4th. Weeds which take up room, but do not add to bulk.

1st. That pastures frequently contain plants that render the fresh herbage at least highly injurious, and often absolutely poisonous to cattle, is a fact not sufficiently understood, or surely we should not see year by year an increasing growth in some meadows of so great a pest as the *Colchicum autumnale*, Meadow Saffron. This plant which puts forth its lilac-coloured flowers without leaves in the pastures in autumn, to be succeeded by its large succulent herbage in the spring, is highly poisonous in all its stages of growth. Some years since a farmer in the neighbourhood of Stow-on-the-Wold, in Gloucestershire, lost 10 calves in one season, from eating the flowers of this plant, which is exceedingly abundant along the whole range of the oolites of the Cotteswold district, and this, notwithstanding that a season or two previously three cows had been poisoned from the like cause in the same district, and probably in the same field. Here the mischief resulted in the usual error of conceiving that the flowers are innocuous from their delicacy and smallness, so that cattle are turned into the autumn pasture, whilst the more conspicuous leaves prevent those who know the plant from depasturing the meadows where it occurs in spring, and in consequence it is made into hay, in which, it is true, much of the poisonous principle is lost in the process of drying. However, a little reflection will show that if it can be entirely eradicated, it would be far better than the being forced to disagreeable expedients to

avoid injury from it; to which end, if the bunches of leaves be pulled in May or even mown off close to the ground, not only will its seeding power be destroyed, but the new corm will be prevented forming,* and thus the parent and progeny are both cut off at one blow. Now, although it is more than probable that the eradication of this pest cannot be expected in one year, yet it will be materially lessened, and we have found two or three seasons, especially of the pulling process, quite sufficient; and the cost of the operation is more than paid for in removing a plant which takes up so much room as to bring it into the fourth category of our table, even if it did not possess poisonous properties.

2d. Such plants as Thistles, and even some Grasses, such as *Hordeum* (the Barley Grasses), greatly injure the hay, on account of the mechanical obstructions they present, such as the spines of the former and the awns or beards of the latter. The Thistles, which are mostly biennial, are easily overcome, as the cutting them off below the crown at once destroys them; but the perennial forms, with the creeping underground stem (*rhizome*) must be mown down while in the freshness and vigour of youth, and never allowed, as is usually the case, to get into flower before they are thus attacked, as then their work is done, and the full-grown leaves have not only been active in bringing forward the flowers, but at the same time have increased the growth of rhizome. One or two seasons of this treatment will greatly weaken this pest, but perfect eradication will require longer time. Objectionable Grasses must be got rid of by other means, and it is a fortunate circumstance that whatever tends to improve the fertility of pasture mostly results in the destruction of Grasses of an inferior kind, which die out as the better species take a stronger hold upon the soil.

3d. There are many weeds in almost every pasture which occupy a large space, but inasmuch as they add something to the hay, and do not possess any more positive injurious tendencies, are allowed to remain unmolested, such as the following:—*Rumex*, Docks and Sorrel, various species; *Polygonum historta*, Snake-root; *Plantago lanceolata*, lance-leaved Plantain; *Heracleum sphondylium*, Cow Parsnip; *Anthriscus sylvestris*, beaked Parsley; and many other large-leaved plants. These, of course, are highly varied in their structure and habits, which must at all times be estimated in dealing with them, but in general they may be expeditiously attacked in detail, by pulling and the spud, or in the aggregate by mowing;—the former methods, if perfectly done, destroying the individuals at once; whilst mowing, though it operates more slowly, is still certain if done in time, the rule to observe being that the herbage should at all times be cut down before it has advanced in the performance of its functions. This is usually too long delayed, which is the reason why hay-making, especially if delayed until too ripe, so slowly effects the desired end, and should warn us that, though sometimes a larger crop is thus obtained, it is often counterbalanced not only by loss of nutriment in the hay itself, but by consequences still more prejudicial to the land.

4th. The best plants in which to observe the effects of the occupation of the soil by useless species are the *Plantago media*, Hoary Plantain; *P. m. var. major*, Greater do.; *Primula veris*, Cowslip; *Bellis perennis*, Daisy. It is not at all uncommon to see the broad-leaved Plantain spreading its single bunch of leaves close to the soil, occupying hundreds of circular patches to the acre of from 5 to 10 inches in diameter; and frequently aggregations may be seen of twice or thrice that size. These are almost if not entirely passed over by the scythe, and at most can only add their small flower-stems (*scapes*) to the hay. And the same may be said of the Daisy, only in a less aggravated degree, as the plants are smaller; whilst the Cowslip, though its leaves do not grow so close to the ground, yet covers a great space, and just in the spring when the Grass growth is determined. The Plantain and Daisy are from their manner of growth great pests in lawns, on which account we determined the last year to attack them on our own lawn, which was expeditiously done by cutting off each individual below the crown; and though we are aware that it is not at all times safe to recommend for field culture such processes as have only been tried in the gardens, yet, after all, this is the only certain method of eradicating these plants wherever they occur, except in such pastures as can be irrigated—irrigation, properly carried out, killing all such plants in a most summary manner. It simply therefore resolves itself into a matter of expense; and if, as our own experiments show, a boy can easily be taught to overlook at least half an acre in a day, and at the same time remove weeds objectionable from other causes, it will at once be seen that, provided we can get Grass to grow on the denuded soil, this in itself may be expected to be sufficient to meet so trifling an outlay, to say nothing of the great improvement in the value of the pasture and hay crops as respects their nutritive qualities. To this end, these weeds should be attacked in the autumn, as the seeding Grasses will sow the denuded spots; and if, in the following spring, the pasture be bush harrowed and rolled, a rapid change for the better will be observed.

In dealing with pastures it should be borne in mind that the Grass tribe of plants is more nutritious than any other pasture herbage; the latter, however, frequently takes possession of the land by reason of exhaustion of the soil, want of drainage and other neglect; and where this is the case, it, after all, frequently follows that encouraging better herbage, by fertilising processes, prevents the necessity of mere mechanical methods of eradication of pasture weeds.

* The Colchicum has a tuber or *corm* to each root, which annually withers whilst the leaves are forming, and at the same time a new *corm* is formed by the action of the new leaves.

OBSERVATIONS ON AGRICULTURAL STATISTICS.—By H. R. Lack.

The number of persons employed in agriculture in Great Britain has been gradually diminishing of late years, as compared with increased population. In the year 1831, according to the Census returns, 31½ per cent. of the males of 20 years of age and upwards were employed in various occupations connected with agriculture, whilst in the year 1851 only 26 per cent. of the males of 20 years of age and upwards were so engaged, showing a decrease of 5½ per cent. in the latter as compared with the former year. The improved method of cultivating the soil, and the introduction of steam and other more perfect machinery for performing farming operations, are no doubt the chief causes of this diminution.

In reviewing the movements of this class during the period that elapsed between the taking the two last Censuses of 1841 and 1851, it is necessary to bear in mind the peculiar position of the agriculturists consequent upon the more general introduction of the free-trade system of politics on the part of the government of the country within that period. The decay and break up of the old protection, and the introduction of the new free-trade system, with the uncertainty of its results to farming interests, acted in any way but favourably either upon the undertaking of agricultural pursuits, or towards stimulating agricultural energy. In addition to this change of policy of the government, the increased demand for manufactured goods both at home and abroad (which demand is looked upon as the result of the introduction of the free-trade system), may have been an inducement to many to have embarked in the more promising commercial employments, and to have abandoned the less remunerative agricultural occupations.

The period then must be viewed, with respect to the agricultural classes, rather as one of trial and transition than one of progress, as a period during which the great question had to be tried, whether or not the new free-trade system would benefit or injure farming interests, whether it would increase or curtail its profits. The question may now almost be said to have been fairly tried, and the result to have proved, to most minds, beneficial, and we may therefore look forward with interest to the coming census of 1861, to furnish us with a fairer view of the position of the agricultural classes as existing in a time of agricultural prosperity.

Farming has of late years been regarded and treated more as a science, and its operations regulated by established principles, rather than by established practices. A large proportion of the total number of farmers in Great Britain are now working their lands upon scientific principles, from which most beneficial results may be anticipated. The improvement in the working of farms is not confined to England alone, but is being rapidly pursued by many Continental nations and by the United States of America, and it is evident that if the British farmer does not now bestir himself and call to his aid the latest improvements that science can offer him, he will be left far behind in this age of universal progress.

The systems of rotation of crops; of returning to the soil in kind, in the shape of manure, &c., the mineral properties exhausted by crops; of draining and irrigation, and of reclaiming waste or exhausted lands, are every day becoming better known and more generally acted upon, and it can hardly be expected that those who persist in doing only as their fathers have done before them, will be able to compete with others who manage their farms on the more improved and reasonable principles.

The same man who laughs at the rude implements of the savage scorns the more perfect machines of civilisation: it may be that he thinks with Aristotle that a happy medium between two extremes is best.

1. Persons Employed.—The total number of persons engaged in agricultural pursuits in Great Britain in each of the years 1841 and 1851 was:

1841	1,499,278
1851	2,390,568

No comparison, however, can be made between these sums on account of the discrepancies in the enumeration of 1841. The following table, No. 1, showing the proportion of males of 20 years of age and upwards engaged in agricultural occupations, gives a more correct view of the position of this class, in each of the years 1831, 1841, and 1851.

Table I.—*Proportion per cent of Occupiers and Labourers (males) of 20 years of age and upwards, of the total male population of Great Britain, of 20 years of age and upwards (exclusive of the army and navy abroad).*

	1831	1841*	1851
England and Wales	31·7	25·6	25·9
Scotland	30·4	26·8	26·5
Islands in the British Seas	35·3	25·5	26·5
Great Britain (taken separately) ...	31·5	25·8	26·

* The proportions for the year 1841 are rather lower than they ought to be, in consequence of "farm servants" having been returned in that year as "domestic servants;" whereas in 1831 and 1851 such servants have been returned, more properly, as agricultural labourers.

Although the number of males of 20 years of age and upwards, employed in agriculture, has greatly increased in 1851 (see Table II.) as compared with the number employed in the year 1831; it will be seen that they bear a less proportion to the population in the year 1851 than they did in the year 1831. This decrease is to be accounted for by the fact that the majority of the increased population embraced manufacturing or commercial occupations; there being comparatively but few openings for them in agricultural employments.

Table II.—*Number of Occupiers and Labourers (males) of 20 years of age and upwards employed in agriculture in Great Britain.*

	1831	1841	1851
England and Wales	1,075,912	1,041,986	1,224,629
Scotland	167,145	166,009	187,190
Islands in the British Seas	8,694	7,275	9,535
Total, Great Britain	1,251,751	1,215,264	1,421,354

2. Size of Farms.—The statistics relating to the sizes of farms are only obtainable for the year 1851. In that year there were 285,936 farms in Great Britain, of the average size of 102 acres each. The proportions in a thousand farms were as follows:—

Under 100 acres	672 farms.
100 and under 200	187 "
200 and under 1000	137 "
1000 and upwards	4 "
	1000

England and Wales.—The number of acres in the hands of 2038 English farmers, holding farms of 700 acres and upwards, exceeded the number of acres in the hands of 97,800 small farmers by 10,060 acres, viz.:

	No. of Farms.	Acres of Land.
Farmers holding Farms of 700 acres and upwards ...	2,038	2,152,050
Small Farmers	97,800	2,141,990

It is remarked in the census report "that when agricultural statistics are obtained, the comparative results of farming in the large and small way will be evident." The large holdings in England and Wales are in the south-eastern and eastern counties, the small farms in the north-midland, in Yorkshire, in Wales, and in the north-western counties, comprising Lancashire and Cheshire. The average size of farms in England and Wales is 111 acres; this, it will be remembered, differs little in size from the "hyde" of the Anglo-Saxons, which, according to some estimates, contained 100, according to others 120 acres. The average size of the English farms is much greater than that of Scotch farms.

Scotland.—In Scotland both large and small holdings are numerous, viz., 360 farms of 1000 acres and upwards, and 44,469 farms each of which is under 100 acres. The average size of Scotch farms is 74 acres.

Islands in the British Seas.—947 farms in a thousand are under 100 acres, and therefore come under the denomination of small farms, if farms under 100 acres can be so designated.

The number of farms in each division of Great Britain in 1851 was—

	No. of Farms.
England and Wales	225,318
Scotland	56,650
Islands in the British Seas	3,968
Total—Great Britain	285,936

(*To be concluded next week.*)

Home Correspondence.

Seeding thick and thin.—Repeated experiments have proved that the capabilities of grains of corn, whether Wheat, Barley, or Oats, are only to be known by planting early, thinly, and singly; and in order for the full development of each grain, whether on poor or rich soils, it requires to be planted at least 3 feet apart square. Although the notion of planting at this extreme distance may be ridiculed and pronounced illogical by thick seeders, yet we contend that by judicious management on good and well-prepared soils, and by planting early in September, each plant of Wheat thus treated will invariably not fail to produce 4000-fold, and half a pint of selected seed is thus sufficient to plant 1 acre, and as a natural consequence, it is, of course, quite possible to obtain a produce of 4000 half pints, equal to 31 bushels, and 1 peck per acre, quite equal to the average yield of the United Kingdom, from the opposite extreme and ordinary practice of sowing 256 half pints, or 2 bushels of seed, and sometimes more to the acre. Anomalous as this may appear, yet it is certain, and defies irrefragable evidence to prove the contrary, that whilst 4000-fold is thus obtainable from half a pint of seed, not 30-fold is nor can possibly be obtained from a full crop of 256 times the quantity, by reason of its extreme thickness; for, were it so, 30 times 2 bushels would be

the average yield, viz., 60 bushels per acre! If our agricultural friends will take the trouble to plant, or thin, small plots of their corn to about 6 inches by 12 apart, or about 18 plants to the square yard (the distance we believe proper for obtaining the fullest crops), their expectations will be fully realised. As the season is now too far advanced to prove the correctness of this statement on Wheat crops, if not already done, we do trust that some unprejudiced farmers will take the trouble to plant, transplant, or thin singly, about a rod at least of their Barley or Oat crops, in the middle of their fields, when it has been up about a fortnight, and afterwards keep it perfectly clean by hoeing it deeply with a hack hoe; then all their doubts of the reasonableness of this expostulation will be removed. *Hardy & Son, Seed Growers, Maldon, Essex.*

The Manchester Guardian Society.—A Trade Memorandum.—Knowing that you are always ready to assist the agricultural interest whenever you can by any means, I have the greater pleasure in giving to you for the benefit of your numerous readers a few hints as to forwarding live stock and produce to some parties resident in Manchester, several of whom combine together and refer as to character from one to another, and by these means have at various times during the last six months obtained possession of some very valuable pigs which have been sold for very little more than the carriage. I have informed the secretary of the Manchester Guardian Society of some of these transactions, and he informs me that the owners have come over after the pigs have been sent some weeks, but of course too late to do any good. Having taken several prizes at Lincoln, and elsewhere, I have not only been applied to but have had some of the pigs to which I allude offered to me at prices such as I would not sell such stock at, and upon inquiry soon found out "the reason why." Most of those I have heard of as coming to Manchester have been black ones; in one case I understood one of the pigs was invoiced at 20*l.* He was a fine bred small boar. I kept the man in treaty for some days to try to find out where it came from, but was not able. The gentleman who sent it has since visited Manchester, and my friend Mr. Cottam found out where the pig was, but it had been sold. If I can be of any use to any person who has such application, I will with pleasure let them know who and what the parties are if they will address *A. B., Box* 124, *Post Office, Manchester.*

Nitrate of Soda v. Guano.—The experiments made by Messrs. Hope, Finnie, and Russell on the comparative value of different portable manures for top-dressing Wheat, which you have published and commented on, are doubtless of much interest to the agricultural community. The result arrived at by each of the experimenters, viz., the superiority of guano over nitrate of soda for this purpose, hitherto generally considered as the one for which there could be no question of the superiority of the nitrate, is a little startling. Query! Had the nitrate a fair trial? It is the custom of those using this manure much to apply it at two different periods—one-half when spring growth is just starting, the other half in two or three weeks afterwards when the shot-blade is about forming. In neither of the experiments we have before us was this attended to. The whole cwt. was sown at once. Hence, as regards nitrate, the result may have been less satisfactory than might have been the case had the method generally adopted been followed by the experimenters. *S.*

Can you contrive to keep Tree Roots out of Pipe Drains, or any sort of Drain whatever?—If too near, we want an impossibility—nothing short of hermetically sealed pipes will effectually prevent their intrusion. This remedy would exclude water, and not dry the land, for which purpose you put in your pipes. The attack is made in dry times, when the tree wants a drink, and down go the roots after moisture. Wherefore does a dry March produce a good stiff standing crop of Wheat? Because the rootlets grow downwards in such moist search. Then from such a state of growth, throwing out very many deep roots, laying strong hold of the soil; and when the summer growing time arrives, such formed vigour causes the plant to tiller well and produce many stiff upright fruit-stalks. Let me, therefore, boldly advance with my drains straight up to the tree, and take him in front, allowing neither an attack from behind, nor on either flank; in growing into the drain in front it would do no farther mischief than what it actually fills up; and probably the water would continue to ooze on and not do any material damage. *An Aged Practical Observer.* [If water can get in the roots will follow. You had better, therefore, not let water into the pipes when close to trees. Bed them in cement just at those places.]

Farmers' Clubs.

Discussion on the Cultivation of Root Crops.—On Monday evening last, the monthly meeting for discussion of the Central Farmers' Club, was held at the York Hotel, New Bridge Street. Mr. Sherer in the chair. Subject, "The Cultivation of Root Crops." Proposer, Mr. Bennett, of Cambridge. He said:—

"In the days we live in, when our agriculture is making the most astonishing advancement, climbing, as Sir James Graham very aptly expresses it, "to the very hill top," it is scarcely necessary for me to say to the enlightened agriculturists I see before me, that, with the judicious cultivation of the fallow crop is immediately connected (I had almost said) all that is great and magnificent in agriculture, and that because it is the foundation on which rests the successful rotation of all the other crops. The fallows neglected, or only imperfectly done, the whole thing is a failure; and the farm throughout will never bear inspection. Whatever course of farming is adopted (and that man is a novice in agriculture who farms without a system), the fallows must be gone into with spirit, and with no niggardly or parsimonious hand; and I must be allowed to say, although some of our amateur agriculturists will tell you that fallows are unnecessary, I trow not, and, although I am no friend to needless restrictions, I hold landlords are justified in requiring that the farm shall systematically, either with or without a green crop, as is best adapted to the soil, receive a good and efficient fallow. Nor is it scarcely more to the interest of the landlord than the tenant (unless the latter is about to run away), that it should be so. Sir, I am free to confess, after an experience of some 40 years—and, like other men, I have occasionally been naughty—but I say it advisedly, I have never stolen a crop in substitution for a fallow, without ultimately drinking damage. The fallow season is the starting post in the race. If the land requires draining, this is the time to effect it. If double ploughing or subsoiling, it must be done now. If crooked and unsightly hedges are to be reduced, there is no time more fitting for the operation than the winter preceding the fallow. In pursuing this discussion, it will perhaps comport with the convenience of the Club, if we first attempt to show on what soils roots may or may not be profitably grown at all. I hope, by the by, this statement will not shock any of my friends around me, because it is the opinion of some of our more modern agriculturists that Turnips may and ought to be grown on all arable land. It is true, there are but few soils on which you cannot cultivate Turnips. But the question we have to discuss is—Can it be done economically, or will another system leave the land in a better state, and the farmer more money in his pocket? The farming world is by no means agreed on this point. There are those who will tell you that, only drain and plough deep, and you may then plant the land with Turnips to advantage, irrespective of the nature of the soil, or its situation as regards the homestead. On the other hand, so much are we the creatures of habit, that I know there are farmers situate in the clay land districts, who year by year pursue the naked fallow system, without attempting anything better, even on the more favourable spots of the farm. The result of my experience, backed by close observation, leads me to believe both these practices are far enough from the correct one, but of the two, the man who recklessly drives at Turnips over all his fallows, however unfit for such a mode of cultivation, will, sure enough, be quit of his money first! In fact, to pursue such a system upon the poorer dead tenacious clays of England is, in my judgment, the most rapid way to ruin a man can well pursue; and for this simple reason—the cost of production far exceeds their value in such situations, while the succeeding crops will show vast inferiority to those the land produces under a naked fallow, or where Tares have been previously fed off with sheep. Close akin to such infatuation is that which induces the farmer of clay land to go through the whole of his farm, like a blind horse in a mill, with his naked fallows, because his father before him did the same, without looking round to see if there are not some portions of the farm contiguous to the homestall where a crop of Mangold and Wheat might be grown, perhaps alternately, to the great benefit of the farm, and sometimes other spots of newly broken up or woodland soil off which, if not fit to depasture sheep in the winter, the crop might be taken for the flock in the spring, with great advantage. In addition to the soils above named, as not generally adapted to the growth of Turnips, we must add, however, a large tract of fenland, particularly in parts of Cambridgeshire, Norfolk, and Lincolnshire. It seems, however, it is not so much because the land will not bear Turnips, or that there is difficulty in feeding them off, but that stock are not found to do well with them from such land. I am not at all sure, however, if this arises from an absolute inferiority of quality, or if it is not the soil attaching to the bulb, which mainly disagrees with the sheep; if so, washing the roots might obviate the evil. For the present, Rape, Mangold Wurzel, and on the better land Potatoes, with here and there a few Cabbages, are the vegetables chiefly grown on the fens, and probably best adapted to the soil. Cabbages might, I think, be profitably cultivated to a much larger extent. Having, then, noticed, in passing on, what soils it is doubtful that Turnips can be grown on with a profit, it is very gratifying to know that the progressive improvements which have been made within the last 50 years in Turnip culture (and are still going on) have contributed perhaps to a greater extent to the production of human food, and added more real wealth to the country, than all other improvements besides. How, then, we may best make these improvements known, and progress still higher in the science, is an object not merely worthy of the best efforts of this Club, but, if I mistake not, of every true patriot in the land. For in the teeth of these astounding improvements it must be admitted, in some districts good farming is yet the exception and not the rule. Nor is the system of Turnip culture by any means uniform, even among tolerably good farmers. What, then, is the best mode of raising root crops, and at the least cost? That is the point in hand. I have bestowed some pains to get at the practice of some eminent agriculturists in different localities, and I regret that it would be taxing the valuable time of this meeting too severely to give the result of these inquiries at all at large; suffice it to say, there is no general uniformity of practice among them, and perhaps with the variation in soils we must not expect it. Mr. Henry Overman, of Norfolk, whose well-earned reputation as an agriculturist and keeper of stock, as well for his hospitality and general intelligence, makes him an authority—this gentleman seems to favour ploughing (on his quality of soil) only a moderate depth, and still drills his Swedes and Mangold on the flat surface, 2 feet apart; and if his Turnips are not the largest they are certainly the best preserved of any I have seen. Mr. Francis Sowerby, of Lincolnshire, a very extensive and spirited agriculturist, adopts the ridge system for all his Mangold and Swedes with great effect; has used the water-drill to some extent, and in July last the Turnips so put in seemed, I am free to admit, very much to take the lead, and I learn are still in favour. Mr. G. Russell, near Woolwich, whom Mr. Caird describes as one of the first growers of green crops in the kingdom, prepares his land by very deep ploughing in the autumn, but first uses manual labour, chiefly with a fork, to extract twitch or other noxious weeds; completing the cultivation with a scarifier, without the further aid of the plough; manuring heavily both with solid and artificial manures; plants on the level surface, I believe, and with such cultivation on a naturally rich soil, grows (as might be expected) the most astounding crops, both of Mangold and Swede Turnips. Gen. Hall, M.P., of Weston Colville, Cambridgeshire, is (to all who know him) no mean authority as an agriculturist. On a naturally weak soil, he commences his cultivation for Turnips and Mangold by very deep four-horse ploughing, and then sometimes drives the subsoil plough through the chalk strata below, after which the common plough has about finished its work, the scarifier, harrows, and roller doing the rest, when a moderate portion of farm-yard manure is applied with the bouting plough, and 4 or 5 cwt. of blood, superphosphate, or the same cost in guano, with 5 cwt. of salt, are put on per acre; and there, in an open tract of country, on a thin chalky soil, doubtless any of you may witness, next autumn, close by the Six Miles Bottom Station, about 40 tons of Mangold and hard by 30 tons of Swedish Turnips per acre, growing most luxuriantly. It is but justice to say the General farms his own land, and is, doubtless, bent on its improvement, almost regardless of expense. But it only shows what may be done by skill and capital in the way of cultivation. I understood the General to have also commenced ploughing two furrows deep for Wheat; in the success of which, however, I must be excused for remaining an unbeliever till I have the honour of paying the gallant General another visit. I will give but one other example. Mr. Charles Howard, of Bedfordshire, a young but spirited agriculturist, began cultivating Turnips on the usual plan of the neighbourhood—fallowing about 5 or 6 inches deep, and after repeated plowings drilled his Turnips but 18 inches apart, on the level land. The consequence was—being a gravelly soil—as soon as the hot dry weather of August or September set in, they almost invariably mildewed, and got so stinted in their growth that three years out of four the unthrifty plants produced nothing but a number of little hard unsightly bulbs, and they of the meanest quality. He now breaks up his land 10 inches deep, with four horses—does the greater part afterwards with the scarifier, harrows, and roller—adopts the ridge system of 27 inches, in which he deposits from 12 to 15 tons of good corn or cake-made manure—has not found the water drill, so far, to answer on his soil, it producing, mixed with the superphosphate, a sort of concrete which runs the soil together where the seed is deposited, like an hasty thunder shower. Nor has he found artificial manures generally pay the extra cost; but with the above cultivations he can grow splendid crops of Turnips without their aid, of which, I must say, I have had ocular demonstration. It is but justice, however, to add, the soil (in fertility) is above an average of the country. Having furnished these examples from different parts of the country, I will now, sir, with your permission, give you as briefly as I can my own views on the subject. If, then, garden cultivation is right, there can be no question that for root crops, as often as they occur, the soil ought to be moved much deeper than is at all necessary or desirable for the general crops of the farm. I am decidedly of opinion, however, that you obtain your object far better, in the general way, by what I call double ploughing than by one deep furrow of 10 or 12 inches, because that furrow must be proportionately wider than the depth to stir it at all properly; and on anything like stiff land you will get a huge untractable lump of earth, which the weather of no ordinary winter will penetrate or pulverise; whereas by taking it up in two ploughs, the latter one being of higher construction and casting the furrow to the top, thereby exposing the most ungenial soil to the winter frost and rains, you leave it in a far better state than even under ordinary spade cultivation. The P.P. Plough, lately invented by the Messrs. Howard, and which took the prize for deep ploughing at Lincoln, as also that of Messrs. Ransom, which followed so close upon the heels of the former, appear to me admirably adapted for taking out this second furrow. And I fully incline to the opinion that almost at any time whenever you want to go beyond 7 inches, requiring more than two horses, looking at the improved state in which you leave the land, it is most economical. I think the system far preferable to one moderately deep furrow followed by the subsoil plough, because in the latter case much of the strata below falls pretty much into its former position, and the virgin soil receives but little benefit from the action of the atmosphere. The depth you go must depend more or less upon the nature of the subsoil—but experience will of course be the best guide. It is but justice to say that I have not hitherto adopted the system at all largely, except as cultivation for Potatoes, Carrots, and Cabbages, but have done a considerable tract for the planting of Fir trees, and it was astonishing what fine Carrots and other vegetables we grew between the trees for two or three years, even on a weak soil, without a particle of manure. In adopting this system, if land be foul, it will be desirable to do as much cleaning as practicable in the autumn before you commence this operation. Indeed among our very best agriculturists autumnal cleaning, where Mangold and Swede Turnips are to follow, is every year becoming more general. (Cheers.) It may be too much to say that the system can be brought to bear on all lands, but in the majority of cases (to borrow a favourite phrase of our friend Mr. Mechi), "I think I might stake my agricultural reputation upon its success." We come now to the seeding operations (for the land so ploughed will require little else than the application of the scarifier, harrows, and roller). It is evident that great authorities still differ as to the best mode of drilling. The result of my own experience, backed by much observation, is, however, very decidedly in favour of the ridge system 27 inches apart, more especially where the Turnips or Mangold are to be carted from the land or stored in heaps — first, because in putting in the manure (if the weather be at all showery) you cart the soil less than by manuring on the flat surface; and if the same quantity of manure is used, you certainly get a greater weight per acre with the manure directly under the plants than otherwise, and that not more from the contiguity of the manure, than the fact that you can move the soil later, clean the land more perfectly, and perform all the hoeing operations far more cheaply, than on the flat surface at nearer intervals, in addition to which they are much more easily extracted when you take them up. Care should be had not to leave the ridges too high to roll freely with a suitable roller, if the weather be dry, before drilling, and not to be afraid of pulling them down with the hoes, as the ridges should be lost ere the hoeing is completed: for it is quite a mistake to suppose that these kinds of bulbs require moulding up. Let them only have something good to feed upon underneath, and if you want fine handsome bulbs, you can hardly disencumber them too much. You thus make the land more even and better for the sheep, and pretty effectually obviate the too frequent irregularity of the succeeding corn crop under ridge cultivation. Had I been addressing a few raw inexperienced farmers, I might have guarded them against drilling Turnip seed among dry clods, and referred them to the couplet of Tusser (I think it is), who says—

"Where clods prevail
The Turnips fail."

And on the subject of manure, I should have said, guard against the prodigal system of those antiquated farmers, who make no calculation of their means, but allow the whole of their farm manure to be laid sometimes on little more than half the fallows—having to finish, if they complete at all, with artificials only; but rather use it with caution, laying on but a moderate quantity of the former, eking it out with blood, superphosphate, guano, Lawes's Turnip manure, Rape-dust, or such other dressing as may be most approved, and he who leaves a portion of dung for Wheat where most wanted (as many good farmers do) is no novice. In putting manure into ridges, use but two ploughs together, one opening and the other closing in the manure close after the spreaders, avoiding exposure to the atmosphere. I have long followed the practice of dragging over the ridges a small piece of timber, or strong Larch pole, reaching four rows at once, sweeping off any of the manure on the top of the ridge and pretty well covering the dung; and in that state add the artificial manures, rather than drill them into a very narrow compass after the ridge is completed; the last plough then closes in altogether, when you have only to roll and drill the seed. I am not, however, so enamoured of the Northumberland system as to suppose, in all situations and circumstances it must be the best. But, on the other hand, where Turnips are not for extraction, but to be fed off upon the ground, they may sometimes be grown to advantage at somewhat narrower intervals; but even in that case, I prefer, if practicable, to place them on smaller ridges, by which you set them more effectually, without smothering the young plants. I have practised this system extensively by attaching small skeleton ploughs to a Bedfordshire drill, forming three straight ridges at a time, about 22 inches apart, depositing the artificial manure by the same operation; and, I repeat, where Turnips are to be fed upon the land, this mode of cultivation, I think, has its advantages. In bringing these remarks to a close—and I fear I have already trespassed too freely upon your indulgence—I assure you I have introduced the subject to elicit the sentiments of the enlightened agriculturists of this Club, and so get them before the public, rather than at all dogmatically to propound my own. What has been said, then, backed by the experience of others, must, I think, pretty generally bring us to this conclusion—that to cultivate root crops profitably we have first to lay the land dry by draining, if required; to clean the fallows intended for the earlier crops in

far as possible, in the previous autumn; to cultivate deeply, taking time by the forelock in getting the soil thoroughly pulverised: not to plough too frequently, nor at all when the land poaches but, if practicable, let it be undisturbed for two or three weeks previous to the last operation: to manure as freely as you can in justice to the Wheat crop, both with the farm and artificial manures: to put all crops intended for carting, or clamping, on the ridge, taking care not to deposit your seed deeper than is necessary to ensure vegetation; to hoe well both by horse and manual labour, not forgetting (as the best money spent in the whole operation) to send over the Turnip and Mangold Wurzel fields, as you may at a trifling cost, a few men after harvest, with a small three-tined fork, and a bag or apron tied before them, taking two ridges at a time, to extract any fibres of twitch or other noxious weeds that may be still alive; and last, though not least, to take warning by the past, and preserve your roots well when you have grown them. (Loud cheers.)

[We must postpone for a week our report of the discussion which followed this very interesting paper.]

Calendar of Operations.

MARCH.

Forfarshire Glens, *April* 2.—With the exception of about a week in the beginning of March we have had uninterrupted frost and snow since the 14th of January, being eleven weeks, and we are still under wintry influences; the atmosphere has a freezing temperature, and the snow clings fast to the ground, and only in few warm spots and sunny slopes has it been moved; the northern sides and tops of the hills still present an unbroken sheet of dazzling white. The consequences both immediate and prospective of such a state of things begin to be felt. There has been no ploughing since the beginning of the storm, and even with favourable weather it can be but partially resumed for eight or ten days to come. The seed time will be late, and indications are not wanting that, in upland districts at least, it will be very late, but our prophetic fears may be disappointed, and the dreaded cloud may yet break in blessings. A benevolent connection may now be traced between the abundant produce of last summer and autumn and the protracted winter which has followed; fodder and Turnips being still in plentiful supply and likely to continue so as long as required. Had a long winter and a late spring followed a deficient crop of the previous season, we should have been very differently circumstanced. The flocks have had considerable hardships to contend with, and notwithstanding that most part of them have to live solely by their own exertions, they have generally reached the present date with remarkably few casualties; they were unusually well-conditioned, both in flesh and wool, at the commencement of winter, and have therefore been able to endure cold and short-comings for so long a period with less injury. There are well authenticated instances of black-faced sheep having lain upwards of six weeks under a wreath of snow, without food, and come out in perfect health [!], clearly showing that they are endowed with the power of secreting within themselves a considerable part of their winter provision, a remarkable adaptation to the circumstances in which they are placed, and one which their owners would do well not to disregard. It is a common remark, that a well summered sheep is an easy wintered sheep. Alpine regions are liable to sudden and violent storms, such as occurred in this district on the 8th and 9th of January, 1852, when whole flocks were engulphed in the drifted snow. On that occasion many were no doubt destroyed, not however by being buried in the snow, but by being driven one above another into hollows and suffocated; some that were merely drifted up came out weeks after without injury. A northern winter requires all the care of the most careful shepherds, and when their duty is well performed it ought to be well rewarded. Much of the ground being still covered with snow, food is scarce, and supplemental rations of hay or straw have been required in many cases during the last two or three weeks. The wedder hogs get Turnips during the spring, for sometimes they had great difficulty in getting at them for snow; but they have now plenty, and are doing well. The lambing season begins in 10 or 12 days; the prospect at present is not cheering, but Grass would rapidly succeed the snow at this advanced period of the season if the weather were at all genial. Although there has as yet been little appearance of disease and few deaths, long privation must have greatly reduced many flocks in condition, and induced constitutional weakness, which will only be developed when the Grass comes, the healthy will then improve and the unhealthy will deteriorate. Fed stock, both sheep and cattle, will pay their rations, and also leave enough for risk and trouble. *S.*

Miscellaneous.

The New Market, Copenhagen Fields.—At a Court of Common Council held this week, Mr. Taylor, chairman of the Markets Improvement Committee, brought up a report in which reference was made to the greatly increased cost (25 to 30 per cent.) of both labour and material since the commencement of the work, involving, according to the estimate of the architect, an expenditure of 30,000*l.* beyond the amount already authorised by the court. This raises the sum of 278,721*l.*, at which the cost was estimated in the report of quarter from 1853 to upwards of 350,000*l.*—The report was received, and after the failure of several amendments, referred to the Coal, Corn, and Finance Committee to consider how the money may be raised for the purpose required.

Notices to Correspondents.

Blood Manure: *X.* Blood is used by very many manure companies now. The Nitrophosphate Manure Company, the Cyanic Manure Company, the so-called Manchester Sewage Manure Company, and the London Manure Company, beside others, use it. The Nitrophosphate Company throw bones and blood together, and add sulphuric acid, thereby manufacturing a manure which, as it contains soluble phosphates along with nitrogenous manure, is as nearly perfect, whether for roots or corn, as anything ordinarily need be; and a similar process is, we believe, employed by other companies, of whose operations we shall shortly speak.

Cut Hole after Tares: *C W S.* Sow early in May, and transplant in the end of June, after you have reduced the land to the proper tilth. Drumheads managed thus will come in for spring use. They may be planted out from 24 to 30 inches apart.

Gas Lime: *G W L.* Most of the ammonia is taken up by the water in the purifying apparatus. The lime absorbs the sulphuretted hydrogen, and will to that extent become, by exposure to the air, gypsum. You should lay it in a heap and turn it frequently over, and afterwards spread it, a ton or two per acre, over stubbles before ploughing.

Potatoes: *Kempsey.* Each ton of tubers placed on a dry well drained spot in a conical heap, well and thickly covered with straw, and then with earth covered with a cap of thatch, is as good a way of keeping Potatoes as any.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „ long	3 „ 3 „		1	15	0
3 „ ditto	3 „ 6 „		2	12	0
3½ „ ditto	3 „ 6 „		2	18	0
4 „ ditto	3 „ 6 „		3	5	0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2	12	0
2½ in. long	ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.

Canonmills Bridge, Edinburgh.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. Samuelson, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which RICHMOND AND CHANDLER have attained in the manufacture of Agricultural Implements; and the recent improvements made upon their various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated) are of the highest value in the economical preparation of food for cattle.—Address Richmond & Chandler, Salford, Manchester; and South John Street, Liverpool. Catalogues gratis.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4*s.* 6*d.* each; Four Tine Forks, 5*s.* 6*d.* each. A liberal allowance on Wholesale Orders.

William Dray & Co., Swan Lane, Upper Thames Street, near London Bridge.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

CAUTION.

Parkes' Steel Digging Forks and Draining Tools.—Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—Maw & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street, Westminster.

FOR PRESENT PLANTING.

BASS AND BROWN offer the following SELECT PLANTS:—

	£	s.	d.
HERBACEOUS PLANTS, 100 fine and distinct vars.	1	10	0

Goods carriage free (not under 20s.) to all the London termini, and all stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40s. and upwards.

COMPLETE CATALOGUES on application for six penny stamps, or the Spring Catalogues alone for three penny stamps, or gratis to our customers who may not have received them.

Seed and Horticultural Establishment, Sudbury, Suffolk.

TO NURSERYMEN, SEEDSMEN, ETC.

MESSRS. E. G. HENDERSON AND SON having had (through their customers), a Seed Catalogue brought under their notice, and which seems to have been distributed throughout the whole of their connection, published by a very eminent and old established firm near London; and on referring to the same they find that all the Hardy Annuals from Nos. 1 to 308, the Half-hardy Annuals from Nos. 309 to 479, Hardy Biennials and Perennials from Nos. 480 to 660, and the Greenhouse Plants and Tender Annuals from Nos. 661 to 741 have all been copied from their lists, with the full descriptions of colour, height, treatment, and other information, even the numbers attached to each article correspond with the strictest accuracy. The only alteration is that no prices are attached, whereas, in the original catalogue every article is priced.

Messrs. E. G. H. & Son beg to say, that as they are at some considerable expense and trouble preparing and issuing their Catalogues throughout the year, they now give notice that in future they shall consider it very disreputable in any parties copying them in the style above alluded to, unless the source from which they derive their information is published at the time, or otherwise communicating with them previously to copying the same.

Wellington Nursery, St. John's Wood, London.—April 7.

MESSRS. E. G. HENDERSON AND SON having purchased of the late W. Story, Esq., of Newton, in the county of Devon, for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, a new feature in this tribe introduced by him, and in consequence of an advertisement appearing in the *Gardeners' Chronicle* from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, it was thought necessary, after a written communication with that gentleman, for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received in the month of November last Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of numbers of their customers having ordered plants at higher prices than are now quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to those purchased of Mr. Story.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

Per packet—	s.	d.
Antirrhinum, extra fine ...	0	6
Auricula, fine mixed ...	1	6
Abronia umbellata	1	6

GEORGE GIBBS & CO., SEEDSMEN,
26, Down Street, Piccadilly, London.

HEATHS AND EPACRISES.

MESSRS. YOUELL AND CO., in offering the following, beg to say that the whole are very healthy and well grown; those marked * are set well for flowering.

ERICAS.—Strong bushy plants in 48's at 12s. per dozen varieties:—Aristata vittata, *aggregata, bicolor, *Cavendishi, Coventryana, *daphnoidea, *denticulata moschata, *echiflora, *grandinosa, *hyemalis, hybrida, hyacinthiflora, Linnæoides nova, Metulæflora bicolor, *propendens, *propendens tubiflora, *pyriformis, *rubens, *Scabriuscula, *Sindryana, *Ventricosa breviflora, *V. coruscans, V. curta rubra, *V. densa carnea, *V. fasciculata rosea, V. fasciculata superba, V. fasciculata longiflora, *V. hirsuta, V. perspicuoides, *V. superba, *V. tumida, *V. tenuiflora, Verticilla Vestita fulgida, *viridiflora, Westphalingi, *Wilmorea superba.

The above are all dwarf bushy plants, and can be supplied to the trade at the usual discount in large quantities.

ERICAS, in large and small 60's, at 9s. per dozen varieties:—Archeriana, ampulacea, amp. carnea, amp. rubra, aristata major, Bandoniana, Cavendishi, corinthoides coronata, Cliffordi, *Colorans, daphnoidea, Devoniana depressa, denticulata moschata, elata, eweriana, eximia, exurgens coccinea, *gracilis, *grandinosa, grandis Hartnelli, *hyemalis, hybrida, hyacinthiflora, longiflora, Linnæoides superba, Metulæflora bicolor, *ovata, *perspicua nana princeps, *propendens, *prop. tubiflora, primuloides retorta major, Savilliana, Shannoniana, do. Turnbull's variety, *Sindryana, splendens, sulphurea, tricolor, tricolor rubra, T. Wilsoni, trossula rubra, Vent. alba, V. alba tincta, V. Browni, V. carnea, V. coccinea minor, V. conspicua, V. dependens coccinea, V. fasciculata longiflora, V. f. rosea, V. globosa, V. grandiflora Storey's), V. hirsuta, V. magnifiora, V. perspicuoides, Vernix coccinea, Vernoniana, Vern. superba, Verticillata, Vestita carnea tenuiflora, Vest. coccinea, Vest. coc. tenuiflora, Vest. fulgida, Vest. rosea, Westcotti, Westphalingi, Wilmorea superba, Walkeri.

These are admirably adapted for specimen growing, being of the proper size to start with; the trade may also be supplied at the usual discount per 100 plants.

EPACRISES, in large 48's, fine plants, 12s. per dozen; ditto in large 60's and small 48's. The following varieties at 9s. per dozen varieties; those marked with an asterisk are set with flower buds:—*Alba pendulifiora, angustissima, autumnalis, *Campanulata alba, *C. maxima, C. grandiflora, Cupelandica, *Carnea, *Cerasiflora, Coruscans, coriacta, densifiora, *densiflora incarnata, *elegantissima, Fairbarniana, *formosa, grandiflora, hyacinthiflora candidissima, hyacinthiflora rosea, *Hopeana, impressa, *imp. alba, *imp. magna, *imp. rosea magna, *lunata, magnifiica, miniata, *nivalis, *nivalis grandiflora, *ornata, purpurascens, rubra grandiflora, *sanguinea, *splendida, Tauntonensis, *variabilis.

This List comprises nearly all the varieties in cultivation. As a winter flowering plant the Epacris is eminently useful; it is also easily managed. The usual discount to the trade per 100 plants. We beg to refer to our advertisement of March 10, where will be found enumerated Centaurs, Choice Greenhouse, and Hardy Plants, &c. &c.

BY SPECIAL APPOINTMENT TO THE SOUTH DEVON AGRICULTURAL ASSOCIATION, AND THE ROYAL AGRICULTURAL SOCIETY, PRINCE EDWARD'S ISLAND, SUPPLY ALL KINDS OF

SEEDS FOR THE FARM AND THE GARDEN.

CARRIAGE FREE, AS PER FOLLOWING SCALE:—

All Orders for Seeds above £1 (excepting heavy articles, as Grain, Tares, Clover, Seed Potatoes, &c., will be delivered Free of Carriage to any Railway Station between Plymouth and Paddington.

All Orders above £2, with the above exceptions, Free to any Station on the Broad Gauge Railways, or to any Market Town in Devon and Cornwall, or to Cork, Dublin, and Liverpool, by Steamers.

All Orders for Seeds above £5, with the above exceptions, will be delivered, Free of Carriage, to any Railway Station in England and Wales, and to any Steam Port in England, Wales, Scotland, and Ireland.

GARDEN ENGINES, SYRINGES, &c.—CAUTION.—The well-known reputation of READ'S Engines, Machines, and Syringes, has led to the nefarious practice of placing Cards in Shop Windows, with the words "READ'S PATENT" over Syringes of the VERY COMMONEST DESCRIPTION. R. READ begs to Caution the Public against being deceived by such false representations, as many of these Instruments, upon trial, will be found defective and useless.—READ'S Instruments have the Royal Arms and address,

35, Regent Circus, London.
